Psychological Abstracts

VOLUME 37

FEBRUARY 1963

NUMBER 1

EDITORIAL NOTE

The system of coding abstracts by letters and numbered employed in the 1962 volume proved to be so cumbersome for readers that it has been abandoned. In this and subsequent issues of the 1963 volume, we return to the former practice of numbering abstracts serially in the order of their appearance.

GENERAL

1. Eisner, H. **A generalized network approach to the planning and scheduling of a research project.** *Operat. Res.*, 1962, 10, 115-125.—The decision box (db) network is a generalization of the PERT network; it allows alternative procedures for accomplishing certain research tasks. When probabilities are assigned to alternatives, the probabilities of various outcomes may be estimated. "Standard PERT techniques for time estimating and scheduling, superimposed on the db network structure, complete the description of this research management tool."—M. R. Marks.

2. Murray, Henry A. **Prospect for psychology.** *Science*, 1962, 136(3515), 483-488.—A vision of the future, as reconstructed after one encounter with the hallucinogenic drug psilocybin.—*Journal abstract.*

OBITUARIES

3. Brogden, W. J. (U. Wisconsin) **Elmer Augustine Kurtz Culler: 1880-1961.** *Amer. J. Psychol.*, 1962, 75(1), 155-160.—Obituary.—R. H. Waters.

4. Fordham, M. C. G. **Jung: 26 July 1875 to 6 June 1961.** *Brit. J. Med. Psychol.*, 1961, 34, 167-168.—Obituary and portrait.—C. L. Winder.

5. Main, T. F. **Klein, Melanie: 30 March 1882 to 22 September 1960.** *Brit. J. med. Psychol.*, 1961, 34, 163-166.—Obituary and portrait.—C. L. Winder.

HISTORY & BIOGRAPHY

6. Ansbacher, Heinz L. **Rudolf Hildebrand: A forerunner of Alfred Adler.** *J. indiv. Psychol.*, 1962, 18(1), 12-17.—The author of a quotation given prominence in Adler's 1st major book is revealed. "When Hildebrand conceptualizes certain psychological processes it sometimes seems that only the specific names by which Adler designated them are lacking." Some similarities between the 2 men are presented.—A. R. Howard.

7. Braatan, Leif J. **Carl R. Rogers: Grunnleggeren av klient-sentrert rådgivning og psykoterapi.** [Carl R. Rogers: The founder of client-centered counseling and psychotherapy.] *Nord. Psykol.*, 1961, 13(7), 289-295.—"... a survey of Rogers' contribution to psychology based upon several years of first hand co-operation with him. The paper describes his career and most significant books, his present

therapeutic orientation, his theory of personality, and some selected research findings."—L. Goldberger.

8. Brill, A. A. **Freud's contribution to psychiatry.** New York: Norton, 1962. 244 p. \$1.45 (paper).—A paperback edition of the book first published in 1944.—E. Y. Beeman.

9. Cardno, J. A. (U. Tasmania) **Inclusion, exclusion, emphasis: Selection in the history of psychology.** *Psychol. Rec.*, 1961, 11, 321-331.—The focus of the paper is on what the historian does and what he should do. "Principles of selection as suggested by the terms used [in the title], are outlined. Evaluation is identified as being more objective than personal interest, but less so than scientific sampling, through the presence of accident, not chance. Sampling proper, it is suggested, will not be feasible while accident remains a constituent of selection, and while the unit of treatment (e.g., author, work) remains literary, not scientific." The paper concludes with a suggestion for genuine, scientific units as the basis for historical studies.—R. J. Seidel.

10. de Ajuriaguerra, Julien, & Angelergues, René. **De la psycho-motricité au corps dans la relation avec autrui.** [Psychomotor functions in interpersonal relations.] *Evolut. psychiat.*, 1962, 27(1), 13-25.—Wallon's unique contribution was the postulation that psychomotor functions have a structural unity which is due to neither biological determinism nor the environment. Furthermore, interpersonal relationships begin on an advanced level with the simultaneous onset of speech and improved psychomotor function. According to Wallon, this phase represents a "tonic dialogue" which involves physical and psychic personality characteristics in affective communication. (English summary)—L. A. Ostlund.

11. Hare, E. H. (Bethlem Royal & Maudsley Hosp., London, England) **Masturbatory insanity: The history of an idea.** *J. ment. Sci.*, 1962, 108, 1-25.—The history of an hypothesis in psychiatry encompasses only 250 years, including full fruition and acceptance among medical men and decline and obsolescence. Conservatism, poverty of skepticism, choice of biased samples, the therapeutic fallacy, and the influence of a prediction upon the event it predicts are adduced to explain scientific popularity of an hypothesis and to illustrate how opinion can go astray, even within educated physicians and scientists. (100 ref.)—W. L. Wilkins.

12. Hendrick, Ives. (Ed.) **The birth of an institute.** Freeport, Me.: Bond Wheelwright, 1961. xiv, 164 p. \$5.00.—The essays which comprise this volume were first presented at the Twenty-Fifth Anniversary of the Boston Psychoanalytic Institute, November 30, 1958. Hendrick surveys the history of psychoanalysis in Boston. Bertram Lewin discusses the organization of psychoanalytic education, historical and current. Karl Menninger gives an

account of his experiences as a student of medicine at Harvard and of his initiation into psychiatry by E. E. Southard. There are concluding remarks by John Milne Murray and a list of former officers of the Boston Psychoanalytic Institute and Society.—*W. A. Varvel.*

13. Heuyer, Georges. *L'influence medicale et psychiatrique dans l'oeuvre de Henri Wallon.* [Medical and psychiatric influences in the work of Henri Wallon.] *Evolut. psychiat.*, 1962, 27(1), 91-99.—Wallon's profound influence on medicine and psychiatry is outlined. Based on the objective analysis of normal and pathological Ss, Wallon explained the successive differentiations and the progressive maturation which adapts the individual to his milieu. This theme is presented and documented in a chronological sequence.—*L. A. Ostlund.*

14. Minkowski, Eugene. *L'humanisme de Henri Wallon.* [The humanism of Henri Wallon.] *Evolut. psychiat.*, 1962, 27(1), 3-12.—The personal and professional life of Henri Wallon indicates a humanistic trend. This theme is elaborated in references to Wallon's activities and publications.—*L. A. Ostlund.*

15. Piéron, Henri. *Sur le chemin des applications sociales de la psychologie.* [Along the road of social applications of psychology.] *Evolut. psychiat.*, 1962, 27(1), 151-159.—The author writes a moving, personal tribute to his colleague, Henri Wallon, also an octogenarian. This biographical sketch, presented in chronological order, contains overtones of the development of psychological thinking and research in France, in the context of historical events during the past 60 years.—*L. A. Ostlund.*

16. Rittmeister, J., & Storch, A. *Die mystische Krise des jungen Descartes: Mit einem Nachtrag zur heutigen Beurteilung Descartes.* [The mystical crisis of young Descartes: With an addendum on Descartes today.] *Confin. psychiat.*, Basel, 1961, 4, 65-98. The dreams of Descartes in the midst of his youthful crisis show him struggling to establish the S as an active knower in a world that had depended on revealed knowledge. Since Descartes we have newly realized that the actively knowing self exists "in-the-world," and not detached from the world as studied by the natural sciences. Not to blame Descartes for our present problems with science and technology but to maintain the actively knowing attitude in the midst of new discoveries of how personal identity exists within the world is our task today. In doing this we achieve for our time what Descartes did for his.—*E. W. Eng.*

17. Rotter, Julian B. *An analysis of Adlerian psychology from a research orientation.* *J. indiv. Psychol.*, 1962, 18(1), 3-11.—Some limitations of individual psychology and some suggestions for research based upon hypotheses derived from it.—*A. R. Howard.*

18. Schipperges, H. *Zur Psychologie und Psychiatrie des Petrus Hispanus.* [On the psychology and psychiatry of Peter of Spain.] *Confin. psychiat.*, Basel, 1961, 4(3/4), 137-157.—Peter of Spain's 13th-century commentaries on the medieval "De Anima" literature going back to Aristotle present a view of human nature more sophisticated than the one we customarily associate with the medieval period. He emphasizes bodily factors in the genesis of psycho-

pathological conditions, and his suggestions for therapy are free from practices of sympathetic magic.—*E. W. Eng.*

19. Sokolov, M. V. (Ed.) *Iz istorii russkoj psikhologii.* [From the history of Russian psychology.] Moscow, USSR: RSFSR Academy Pedagogical Sciences, 1961. 439 p.—The essays in this book explore periods in history of Russian psychology ranging from the 14th to the early 20th century.—*I. D. London.*

20. Wyatt, Frederick. (U. Michigan) *A psychologist looks at history.* *J. soc. Issues*, 1961, 17(1), 66-77.—A discussion of the generally ahistorical, segmental, experimental approach espoused by psychologists as contrasted with the generally more global and synthetic approach of the historian, particularly in studying the sweep and scope of social change.—*A. Barclay.*

THEORY & SYSTEMS

21. Borgatta, E. F. (U. Wisconsin) *Toward a methodological codification: The shotgun and the saltshaker.* *Sociometry*, 1961, 24, 432-435.—"The first question is that, given the multitude of findings that occur when a great many questions are asked, how does one find out which ones are the stable or important ones? And second, is it worth theorizing after the fact?" As to the 1st question the traditional procedure requires the E to revise his theory, while the shotgun researcher can immediately go to his data and reject much that the traditional researcher must continue to test. With respect to the 2nd question, it is not a matter of whether theory should be built on a post hoc basis, but rather that there is no other alternative.—*H. P. Shelley.*

22. Findley, Jack D. (U. Maryland) *An experimental outline for building and exploring multi-operant behavior repertoires.* *J. exp. Anal. Behav.*, 1962, 5(1, Suppl.), 113-166.—"The material to follow represents, in part, the results of several years of laboratory effort in which the pursuit of behavioral control progressively took precedence over the statement of problems and answers, and in which it was often pursued in their absence. The major result of this effort has been a demonstration that it is feasible to build, describe, and manipulate complex samples of behavior under controlled conditions, on a scale limited only by our individual laboratory behavior. . . . to do so is in many ways basic to the building of a science of behavior. The following sections are concerned with: first, the nature of multi-operant behavior and general problems of its establishment and analysis; second, the conceptual and notational description of multi-operant behavior; and, finally, the reporting of the laboratory story which largely generated the notions and points of view presented below." (20 ref.)—*J. Arbit.*

23. Herbst, P. G. (Inst. Industrial Social Research, Trondheim, Norway) *A theory of simple behaviour systems. Part II.* *Hum. Relat.*, 1961, 14(3), 193-239.—The presentation of a behavior theory is continued from a previous paper (see 36: 2AD71H). The quantitative formulation is expanded by 7 principles dealing with the following relations: (a) output as a function of activity rate and integration level, (b) the effect of stress on output components, (c) performance satisfaction as a

function of output versus cost, (d) strain and balance as a function of action potential, (e) strain as a condition of imbalance between action level and action potential, (f) the effect of stress on output as a function of action potential, and (g) the effect of stress on strain and external adjustment processes. (59 ref.)—*W. W. Meissner*.

24. Hirschman, Albert O., & Lindblom, Charles E. (Columbia U.) **Economic development, research and development, policy making: Some converging views.** *Behav. Sci.*, 1962, 7(2), 211-222.—Recent work on economic development, technological research and development, and policy-making challenges some widely accepted generalizations about the process of problem solving and decision making. It is argued that a carefully thought-out plan for research may hinder achievement of the desired goal, and that it may, at times, be easier to solve a problem when the problem is not fully understood.—*J. Arbit*.

25. Meissner, W. W. (Woodstock Coll.) **Intervening constructs: The problem of functional validity.** *Psychol. Rec.*, 1961, 11, 355-364.—The classic paper by MacCorquodale and Meehl (1948) which attempted to distinguish between the functional status (IV) and structural basis (HC) of theoretical concepts is used as the point of departure. The discussion focusses upon the methodological problem of functional validity and develops the point that IV and HC have distinct, equally important roles to play in theory development.—*R. J. Seidel*.

26. Toda, Masanao. (Hokkaido U., Sapporo, Japan) **The design of a fungus-eater: A model of human behavior in an unsophisticated environment.** *Behav. Sci.*, 1962, 7(2), 164-183.—The characteristics of the model and its interactions with the environment are discussed and a number of problems raised for further analysis.—*J. Arbit*.

PHILOSOPHY

27. Bakan, M. **Some aspects of the relationship between psychology and philosophy.** *Percept. mot. Skills*, 1962, 14, 260-262.—Several aspects of the relationship between psychology and philosophy are considered. Brand Blanshard, an idealist, is the focus of discussion.—*W. H. Guertin*.

28. Beth, E. W., & Piaget, Jean. **Épistémologie mathématique et psychologie.** [Mathematical epistemology and psychology.] Paris, France: Presses Univer. France, 1961. 352 p. NF 22.—A detailed analysis by a logician and a psychologist leading to the view that logic and mathematics on the one hand and psychology on the other are completely autonomous disciplines. This independence implies the necessity for renouncing all "psychologizing" in logic and mathematics and all "logicizing" in psychology to guarantee autonomy of research in the respective domains. Such a view creates epistemological problems since any effort to develop a scientific epistemology as opposed to a purely speculative one demands that a certain coordination be established between logic and psychology. These 2 activities interacting with each other as they do, not because they are interdependent but because they are autonomous and complimentary, make possible and necessary the search for an epistemological synthesis. (137 ref.)—*G. H. Mowbray*.

29. Buber, Mordekhay Martin. **Ketavim pilosofiyim. I. Besod siah.** [Philosophical writings. Vol. I. Intimacy of dialogue: The man and encounter with the being.] Jerusalem, Israel: Bialik Institute, 1959. 261 p.—In this 1st volume of the author's philosophical writings in Hebrew, parts of a theory are mentioned which explain man's double encounter with existence and make it clear by concrete examples.—*H. Ormian*.

30. Buber, Mordekhay Martin. **Ketavim pilosofiyim. II. Peney haadam.** [Philosophical writings. Vol. II. Man's countenance: Discourses in philosophical anthropology.] Jerusalem, Israel: Bialik Institute, 1962. 433 p.—In this, the 2nd and last volume, 2 kinds of writings are given. They are intended to base the system both on the point of view of the history of thinking and on the point of view of anthropology. "Not an abstract philosophical system is given, but the basic reality, which man must today see properly."—*H. Ormian*.

31. Emmerglick, Leonard J. (Washington, D. C.) **Open vision in science.** *Main Curr. mod. Thought*, 1962, 18(3), 51-54.—A plea for greater awareness of the importance of the creative aspect of scientific enterprise. This means highlighting imaginative speculation, trying on new assumptions, and attempting new generalizations and integrations as opposed to being merely fact centered.—*J. R. Royce*.

32. Fitzpatrick, W. H., & DeLong, C. W. (National Inst. Health) **Soviet medical research related to human stress: A review of the literature.** Washington, D. C.: United States Department Health, Education, & Welfare, Public Health Service, 1961, (PHS Publ. No. 853) 121 p. \$40.—Material in this report includes data on human stress published by Soviet scientists between 1950 and December 1958. Contents include studies on external biological factors related to stress, internal factors, and factors affecting the nervous system and behavior.—*E. M. Bower*.

33. Gendlin, Eugene T. **Experiencing and the creation of meaning: A philosophical and psychological approach to the subjective.** New York: Free Press Glencoe, 1962. xv, 302 p. \$6.00.—A detailed "analysis of meaning" is offered, based on an examination of "the functions of experience and of symbols in relation to each other." The analysis is applied to psychotherapy, art, religion, and social theories.—*R. Tyson*.

34. Greenspoon, J. (Florida State U.) **Perspectives in psychology: XIX. Private experience revisited.** *Psychol. Rec.*, 1961, 11, 373-381.—A review of the position taken by many psychologists on private vs. public experience. The author concludes that the difficulty in dealing with the concept of "private experience" is that it represents a false point of departure for any science and particularly for psychology. "Psychologists have tended to use experience as the starting point, but the difficulties of experience as the starting point are readily observable in the confusion which has evolved. The starting point for psychology could just as readily be designated as behavior; and that is all."—*R. J. Seidel*.

35. Harman, Willis W. (Stanford U.) **The humanities in an age of science.** *Main Curr. mod. Thought*, 1962, 18, 75-83.—Defines humanities as "primarily concerned with man's inner or subjective life." The spirit of inquiry is similar in both domains.

Just as science attempts to order our understanding of the outer or objective world, the humanities attempt to order the inner or subjective world. The author, a physical scientist, suggests that the contemporary scientific world view is too restrictive (e.g., too physicalistic, too impressed by that which is quantifiable, etc.), especially in its exclusion of the "mental" order. Humanistically oriented scholars must spearhead the development of valid research methods which can deal with inner man. "Its language will be more that of the poet than of the mathematician, for the knowledge to be ordered has to do with feelings as well as thoughts, and the symbols to be used are not subject to mathematical manipulation. Its methodology will be different, for the investigator must be willing to become the instrument of investigation."—*J. R. Royce.*

36. C. G. Jung Institute. (Zurich, Switzerland) *Das Böse.* [Evil] Zürich, Switzerland: Rascher, 1961. 261 p. S. Fr. 27.50.—In a 1959-60 lecture series at the C. G. Jung Institute, the central topic of "evil" was considered in relation to mythology (K. Kerényi), eastern religions (G. Widengren), anti-Christ (V. Maag), fairy tales (M. L. von Franz), films (M. Schlappner), psychological notions (L. Frey-Rohn), philosophical concepts (K. Löwith), and creativity (K. Schmid).—*H. P. David.*

37. Paunero, Enrique. *Dilthey, Kant y la psicología de la totalidad.* [Dilthey, Kant and the psychology of totality.] *Acta neuropsiquiat. Argent.*, 1961, 7(4-5), 272-279.—The Cartesian separation of the object and the subject, and the Kantian refusal to admit the knowability of existing objects gave rise to a psychology which denied the spiritual "I" and recognized only behavior as the valid basis of psychology. Dilthey, followed by Jaspers, opposed such atomizing psychologism with a more holistic and existential approach to understanding human activity, which embraces the psychosomatic and spiritual dimension of man in a total conception.—*W. W. Meissner.*

38. Smith, Kendon. (U. North Carolina) *The naturalistic conception of life.* *Amer. Scientist*, 1958, 46, 413-423.—Life is defined in objective terms. A naturalistic view of living objects is briefly stated and defended; and implications are derived for issues of emergence, determinism and indeterminism, choice, conscious experience, and ethical decision.—*Author abstract.*

39. Zeh, Wilhelm. *Die Raumzeit-Gestalt der Erinnerung.* [The spatiotemporal gestalt of remembrance.] *Confin. psychiat., Basel*, 1961, 4(3/4), 165-193.—A variety of evidence speaks for the basically spatial character of memory experience: the spatial character of several psychological metaphors, the findings of Stern on the priority of spatial over temporal perception in the small child, the simultaneity of successive events in experienced memory, and the findings of W. Metzger. The metrical space of physics is a remote derivative of experienced space the latter occurs in remembrance as a spatiotemporal gestalt constitutive of experienced order, situation, and responsibility.—*E. W. Eng.*

STATISTICS

40. Boring, Edwin G. (Harvard U.) *The beginning and growth of measurement in psychol-*

ogy. In Harry Woolf (Ed.), *Quantification: A history of the meaning of measurement in the natural and social sciences* (see 37: 56). Pp. 108-127.—The history of quantification in psychology is written in 4 parts: (a) psychophysics, "which may be thought of as founded in 1860 with the publication of Fechner's *Elemente der Psychophysik*, but which goes back nearly a hundred years more"; (b) the history of reaction time and "Psychology's self conscious effort to become 'founded' as a new experimental science"; (c) the measurement of learning and remembering, flourishing first as stimulated by Ebbinghaus in the 1880s, then strongly influenced by Thorndike, Pavlov, and Skinner; and (d) the measurement of individual differences (beginning with Galton, Cattell, and Benet) and its offshoot, statistical methods.—*E. Y. Beeman.*

41. Hammond, Kenneth R., & Householder, James E. (U. Colorado) *Introduction to the statistical method: Foundations and use in the behavioral sciences.* New York: Knopf, 1962. xvi, 417 p.—This beginning text addresses itself "to the logic of the statistical method for its own sake . . . irrespective [of] immediate application." It includes chapters on: generalizations, induction, and variability; measurement and mathematics; central tendency; variability; individual performance; correlation; a model of randomness; random sampling distributions; and statistical decisions. Problems accompany each chapter, with answers appended.—*E. B. Page.*

42. Hoffman, Paul J. (Oregon Research Inst., Eugene) *Assessment of the independent contributions of predictors.* *Psychol. Bull.*, 1962, 59(1), 77-80.—In answer to comments by Ward (see 37: 1294) an effort is made to clarify the term "independent contribution." Whereas Ward's use is more ordinarily known as the part correlation, Hoffman means "that the variance of predicted scores may be successfully partitioned into a simple sum of ingredients, each referring to a specific predictor and each being independent of any joint effect or interaction."—*W. J. Meyer.*

43. Hundleby, John Dennis. (Pennsylvania State U.) *Item characteristics and skewness of observed score distributions.* *Dissert. Abstr.*, 1961, 22(1), 333.—*Abstract.*

44. Kaiser, Henry F. (U. Illinois) *Scaling a simplex.* *Psychometrika*, 1962, 27(2), 155-162.—A least-squares solution for scaling the variables of a Guttman simplex is developed. The procedure yields a ratio scale and 2 varieties of interval scale and orders the variables. A measure of the goodness of fit of the scale to the data is suggested. An example of the application of the method is given. The problem of non-positive correlations is discussed.—*Journal abstract.*

45. Kaiser, Henry F., & Dickman, Kern. (U. Illinois) *Sample and population score matrices and sample correlation matrices from an arbitrary population correlation matrix.* *Psychometrika*, 1962, 27(2), 179-182.—A method for generating sample and population score matrices and sample correlation matrices from a given population correlation matrix is developed. An example giving the desired matrices for a population Guttman simplex correlation matrix is presented.—*Journal abstract.*

46. Levi, Isaac. (Western Reserve U., Cleveland) **On the seriousness of mistakes.** *Phil. Sci.*, 1962, 29(1), 47-65.—"The argument from statistics in favor of behavioral view is outlined; an interpretation of two statistical procedures (Bayes' method and significance testing) is offered which does not entail a behavioral analysis of 'accepting a hypothesis'; and the conclusion that non-behavioral analyses of belief are compatible with the application of current statistical theory in the sciences is tentatively advanced." Conventions concerning statistical inference and decision may differ but the differences are those of "degrees of caution" as expressed among investigators and, as such, are subject to strict logical analysis.—*M. Turner.*

47. Mack, Sidney F. (Pennsylvania State U.) **Elementary statistics.** New York: Holt, Rinehart & Winston, 1960. ix, 198 p. \$4.50.—Topics discussed are: mathematics refresher, summarization of data, fundamentals of probability, probability distributions, the normal distribution, the sample mean and standard deviation, statistical estimation, testing hypotheses, the chi-square and "student's" distributions, and linear correlation and regression. Greek alphabet; computational methods and formulas for use with a desk calculator; and tables of squares of numbers 1.00 to 9.99, standard normal curve areas, chi-square percentiles, and "student's" curve areas are included.—*G. C. Carter.*

48. McNemar, Quinn. (Stanford U.) **Psychological statistics.** (3rd ed.) New York: Wiley, 1962. vii, 451 p. \$7.75.—Designed for an intermediate course, the aim is to give a concise coverage of the statistical techniques needed in behavioral sciences. "The stress continues to be on interpretations and assumptions rather than on computations." A chapter on trend analysis and more challenging exercises have been added, as have several other smaller topics and recent developments.—*E. Y. Beeman.*

49. Prokasy, W. F. (Pennsylvania State U.) **Inference from analysis of variance of ordinal data.** *Psychol. Rep.*, 1962, 10(1), 35-39.—From consideration of the 3 possible sources of inference in a 2-way analysis of variance, it is concluded that "the analysis of variance model is neither to be denied application if the data are ordinal nor to be used as a general source of inference about psychological attributes in disregard of the level of measurement employed."—*B. J. House.*

50. Ray, W. S. (U. North Carolina) **Statistics in psychological research.** New York: Macmillan, 1962. vi, 303 p. \$6.00.—This introductory text uses the linguistic distinctions between syntactics, semantics, and pragmatics in order to help the student understand statistics. A review of basic arithmetic and algebra, summation sign, movements, product moments, partial and multiple correlations, analysis of variance, sampling theory, and sampling distributions make up the syntactic realm. Measurement and practical random sampling are treated as semantic problems, and the description of data by means of moments and product moments, and statistical inference are the pragmatic issues. The difference between empirical and experimental research is emphasized.—*W. J. Koppits.*

51. Scott, W. A., & Wertheimer, M. **Introduction to psychological research.** New York: Wiley,

1962. xiii, 445 p.—A textbook designed for the 1st level graduate student which provides a step-by-step introduction to the rituals involved in the course of a typical research project. The material is organized and presented in terms of the following topics: research process: an overview; initial stages in a research project; conditions for generalizing findings; control over research variables; developing quantitative measures; instrumentation: verbal measures; instrumentation; experimental equipment; instrumentation: human judgment; sample design; experimental design; obtaining and dealing with subjects; arrangements for data collection; analyzing the results; and interpreting and reporting the results.—*M. J. Wayner, Jr.*

52. Smith, H., Gnanadesikan, R., & Hughes, J. B. **Multivariate analysis of variance (MANOVA).** *Biometrics*, 1962, 18(1), 22-41.—An illustration of the methods of analysis and interpretation of several dependent variables using Model I of MANOVA. The basic theory is summarized, including tests of significance and confidence interval estimation. An outline of a computer program is presented. Some unresolved problems are discussed. (26 ref.)—*R. L. McCornack.*

53. Tobach, E., Schneirla, T. C., & Aronson, L. R. (American Museum Natural History) **The ATSL: An observer-to-computer system for a multivariate approach to behavioral study.** *Nature, London*, 1962, 194, 257-258.—A data-collection and recording system is described which can be processed by a digital computer with appropriate programming and which can be used in any behavioral experiment utilizing either observer-generated or animal-generated data or both.—*M. Benton.*

54. Vandenberg, Steven G., Green, Bert F., & Wrigley, Charles F. (U. Louisville) **A survey of computer usage in departments of psychology and sociology.** *Behav. Sci.*, 1962, 7(1), 108-110.—The extent of computer use and training offered in computer usage in 127 psychology departments and 29 sociology departments is reported.—*J. Arbit.*

55. Wilks, Samuel S. (Princeton) **Mathematical statistics.** New York: Wiley, 1962. xvi, 644 p. \$15.00.—This introductory text book includes: distribution functions, moments and sequences of random variables, selected discrete and continuous functions, sampling theory, parametric and nonparametric estimation and hypotheses testing, sequential analysis, decision functions, time series, and multivariate theory.—*E. Y. Beeman.*

56. Woolf, Harry. (Ed.) **Qualification: A history of the meaning of measurement in the natural and social sciences.** Indianapolis, Ind.: Bobbs-Merrill, 1961. 224 p.—The book contains 7 chapters by different authors on the progress of quantification in the physical and medical sciences, biology, economics, sociology, and psychology.—*E. Y. Beeman.*

Experimental Design

57. Edwards, Allen. (U. Washington, Seattle) **Experimental design in psychological research.** (Rev. ed.) New York: Holt, Rinehart & Winston, 1960. xiii, 398 p. \$6.50.—A revised edition of the 1950 text. Many changes have been made in the arrangement and presentation of material. Several new chapters have been added, including chapters on

multiple comparison tests, randomized blocks design, trend analysis, and analysis of variance models and mean square expectations. As in the 1st edition, problems are presented at the end of each chapter, the answers for which are given in an appendix.—*E. Y. Beeman.*

58. Maxwell, A. E. (U. London) **Binomial sequential analysis: Good ethics, little effort.** *Educ. psychol. Measmt.*, 1962, 22(1), 57-69.—"... psychological and medical experiments are often conducted in a sequential manner as subjects suitable for the experiment become available. When this is so, both ethical and statistical problems arise. . . . binomial sequential techniques are reviewed and an attractive new method is described which requires no calculations to be performed and which allows the investigator to fix his sample size in advance."—*W. Coleman.*

59. Winer, B. J. **Statistical principles in experimental design.** New York: McGraw-Hill, 1962. x, 672 p. \$12.50.—A detailed description of the basic principles, standard experimental designs, and their potential applications in research areas in the behavioral sciences. The material is organized in terms of: basic concepts in statistical inference, testing hypotheses about means and variances, design and analysis of single-factor experiments, single-factor experiments having repeated measures on the same elements, design and analysis of factorial experiments—computational procedures and numerical examples, multifactor experiments having repeated measures on the same elements, factorial experiments in which some of the interactions are confounded, balanced lattice designs and other balanced incomplete-block designs, Latin squares and related designs, analysis of covariance, and topics closely related to the analysis of variance.—*M. J. Wayner, Jr.*

Formulas & Calculations

60. Bendig, A. W. (U. Pittsburgh) **Forty variables phi coefficient correlation and chi-square program for the expanded IBM 650.** *Educ. psychol. Measmt.*, 1962, 22(1), 167-170.—"This program computes phi correlation coefficients among n variables where n is equal to or less than 40. The output gives the size of the sample, the number and proportion of cases falling in one category of each of the dichotomous variables, a chi-square test of the significance of the relationship between each pair of variables, and the phi coefficient, in either fixed or floating point arithmetic, between each pair. Data cannot be missing on any of the variables: if data are missing the case must be omitted."—*W. Coleman.*

61. Cornell, Richard G. **A method for fitting linear combinations of exponentials.** *Biometrics*, 1962, 18(1), 104-113.—"The estimation procedure of partial totals has been developed for a linear combination of any number of exponential terms with data taken at equally spaced points. The statistical properties of these estimates have been investigated and the computation of estimates has been illustrated."—*R. L. McCornack.*

62. Cramer, Elliot M. (Johns Hopkins U.) **A comparison of three methods of fitting the normal ogive.** *Psychometrika*, 1962, 27(2), 183-192.—The Mueller-Urban method of fitting the normal ogive is derived, and the inadequacies of its inherent as-

sumptions are discussed. This and the unweighted least squares method are compared to the maximum likelihood solution which is shown to be very close to the "ideal" least squares solution. As an empirical demonstration of the superiority of the maximum likelihood solution, random ogives are fitted by all 3 methods; and they are compared on the basis of the expected values and the standard errors of the estimates. It is concluded that the maximum likelihood solution is uniformly superior to the others in all respects.—*Journal abstract.*

63. Cramer, Elliot M. (George Washington U.) **Fitting the normal ogive on the IBM 650.** *Educ. psychol. Measmt.*, 1962, 22(1), 177-181.—For the model, $\rho = \int_{-\infty}^{\infty} N(m, \sigma) dv$, a program has been written providing a maximum likelihood solution. "Considerable flexibility has been built into the program so that many functions may be fit with minimal data handling and key punching."—*W. Coleman.*

64. Cramer, Elliot M. (George Washington U.) **A general correlation program for the IBM 650.** *Educ. psychol. Measmt.*, 1962, 22(1), 149-154.—A program for computing a matrix of intercorrelations or cross-correlations as well as means and standard deviations. Computation formulas are given and input, control, and output card forms are shown. Listing procedure and operating instructions are also given.—*W. Coleman.*

65. Daly, C. **A simple test for trends in a contingency table.** *Biometrics*, 1962, 18(1), 114-119.—A method for allowing for trends when examining contingency tables for association between rows and columns representing ordered classifications.—*R. L. McCornack.*

66. Gibson, W. A. (Dept. Army) **On the least-squares orthogonalization of an oblique transformation.** *Psychometrika*, 1962, 27(2), 193-195.—After proving a special case of a theorem stated by Eckart and Young (namely, that an oblique transformation G is the product of 2 different orthogonal transformations and an intervening diagonal), this note shows that the best fitting orthogonal approximation to G is obtained simply by replacing the intervening diagonal by the identity matrix. This result is shown to be identical with 2 earlier orthogonalizing procedures when G is of full rank. A multiplicity of solutions is shown for the case of a singular G .—*Journal abstract.*

67. Goldstein, Donald Aaron. (Pennsylvania State U.) **An expression for the test characteristic kurtosis in terms of item parameters and an estimate of a quantity appearing in this expression.** *Dissert. Abstr.*, 1961, 22(1), 331-332.—*Abstract.*

68. Gyr, John; Thatcher, James, & Allen, George. (U. Michigan) **Computer simulation of a model of cognitive organization.** *Behav. Sci.*, 1962, 7(1), 111-116.—Describes the properties of the computer program written to fit a model of cognitive organization derived from an earlier study of problem solving and information processing. Discusses the problems of the earlier research and the empirical properties of the derived model.—*J. Arbit.*

69. Henrysson, S. **The equivalence coefficient and the Kuder-Richardson Coefficient 20.** *Scand. J. Psychol.*, 1962, 3(1), 40-46.—The relation between the equivalence coefficient and the Kuder-Richardson

Coefficient 20 is discussed. Formulas, tables, and graphs of the difference between the 2 coefficients are given. In most cases the difference between the 2 coefficients will be rather small.—*Journal abstract.*

70. Henrysson, Sten. **Methods of adjustment of item-total correlations for overlapping due to unique item variance.** *Res. Bull. Inst. Educ. Res., U. Stockholm*, 1962, No. 8. 14 p.—The biserial correlation between an item and the total test of which the item is a part tends to be misleadingly high when used in item analysis, since the item is included in the total test. 5 different methods of adjustment for this overlap are suggested. These methods try to correct only for the influence of the unique part of the item variance. This is done by using communalities instead of item variances in the diagonal of the interitem covariance matrix. Empirical demonstrations are given. 1 of the 5 methods is preferred, since it is easy to use and gives invariance with respect to test length.—*Journal abstract.*

71. Holdrege, Fred E., Lawrence, Harry G., Kagihara, Robert H., & Born, Gerald. **Iterative item analysis.** *USAF ASD tech. Note*, 1961, No. 61-148. 10 p.—A method of weighting individual items which uses part correlation coefficients to obtain maximum test criterion correlation has been proposed. A simple method for graphical solution of the formula for a part correlation coefficient is presented to make the proposed system of iterative item analysis feasible without the use of an electronic computer. By continuing the iterative procedure, this technique produces a result comparable to that obtained from standard iterative multiple regression techniques. The technique was applied to a practical item selection problem and demonstrated improved prediction over a single empirical key. Further studies could determine applicability to other item types and the limits of effective iteration.—*USAF ASD.*

72. Kleinmuntz, Benjamin, & Alexander, L. Barton. (Carnegie Inst. Technology) **Computer program for the Meehl-Dahlstrom MMPI profile rules.** *Educ. psychol. Measmt.*, 1962, 22(1), 193-199.—The Meehl-Dahlstrom configural rules for discriminating neurotic from psychotic patients on the MMPI have been programmed for the IBM 650. The Carnegie Institute of Technology General Algebraic Translator Extended System (CATE) was used to facilitate writing the program.—*W. Coleman.*

73. Lefkowitz, Monroe M., & Greene, Harold E. (Rip Van Winkle Found.) **Obtaining components essential to a number of statistical analyses by use of the IBM accounting machine.** *Educ. psychol. Measmt.*, 1962, 22(1), 183-186.—A wiring diagram is shown for using the IBM 402 accounting machine to obtain the following terms: N , X , X^2 , XY , Y , and Y^2 . The operation of the program is described along with its limitations. A method for determining the running time that will be used is also presented.—*W. Coleman.*

74. Lotto, Gary. (U. Pittsburgh) **CORR1 and CORR2: Correlation routines for the IBM 7070.** *Educ. psychol. Measmt.*, 1962, 22(1), 155-162.—These programs "are designed to calculate sums, sums of squares, and all possible sums of cross-products for up to 130 variables of 4 digit data." The results are converted to a printed or punched matrix of correlation coefficients. The programs are de-

scribed with the machine requirements, timing, input format, operating instructions, etc.—*W. Coleman.*

75. Lotto, Gary. (U. Pittsburgh) **MR1: Multiple regression analysis on the IBM 7070.** *Educ. psychol. Measmt.*, 1962, 22(1), 163-166.—"MR1 will compute the appropriate statistics to a multiple regression analysis for up to 129 independent variables. It operates in a stepwise fashion, first computing these statistics for the one 'best' i.v. It then selects the 'best' of the remaining variables from the pool of independent variables." Its method of functioning, timing, machine requirements, and input format are described.—*W. Coleman.*

76. Michael, William B., Jones, Robert A., Gaddis, L. Wesley, & Kaiser, Henry F. (U. Southern California) **Abacs for determination of a correlation coefficient corrected for restriction of range.** *Psychometrika*, 1962, 27(2), 197-202.—Abacs approximating the product-moment correlation for both explicit and implicit selection are presented. These abacs give accuracy to within .01 of the corresponding analytic estimate.—*Journal abstract.*

77. Patil, G. P. **Some methods of estimation for the logarithmic series distribution.** *Biometrics*, 1962, 18(1), 68-75.—Different estimates for the parameter of the logarithmic series distribution and an investigation of their efficiencies and the amounts of bias are presented. Computations are illustrated using a distribution of number of publications of biologists.—*R. L. McCornack.*

78. Saunders, Sarah Gabriel; Gaddis, L. Wesley, & Michael, William B. (U. Southern California) **An IBM 650 program for item analysis of dichotomized variables.** *Educ. psychol. Measmt.*, 1962, 22(1), 171-176.—An IBM 650 program for item analysis procedures involving fourfold tables is described. The program permits calculation of chi square and phi coefficients. It can also be used for determining the marginal values of the fourfold tables in terms of frequencies of responses and for converting marginal values to proportions of the total frequency.—*W. Coleman.*

79. Shepard, Roger N. (Bell Telephone Lab.) **The analysis of proximities: Multidimensional scaling with an unknown distance function. Part I.** *Psychometrika*, 1962, 27(2), 125-140.—A computer program is described that is designed to reconstruct the metric configuration of a set of points in Euclidean space on the basis of essentially non-metric information about that configuration. A minimum set of Cartesian coordinates for the points is determined when the only available information specifies for each pair of those points, not the distance between them, but some unknown, fixed monotonic function of that distance. The program is proposed as a tool for reductively analyzing several types of psychological data, particularly measures of inter-stimulus similarity or confusability, by making explicit the multidimensional structure underlying such data.—*Journal abstract.*

80. Walder, Leopold O., Greene, Harold E., & Lefkowitz, Donna D. (Rip Van Winkle Found.) **A method for deriving "flexible" sociomatrices from response forms appropriate to children in the third grade.** *Educ. psychol. Measmt.*, 1962, 22(1), 187-191.—The use of a 26-page booklet for collecting peer-rating data on 25 items and an expedient

method for key-punching the responses onto IBM cards is described. An Item Adder Program is available for the IBM 650 to sum the object cards and to recompute the percentages for yielding composite object scores.—*W. Coleman.*

81. Webster, H. (U. California, Berkeley) **Reliability of the ordering achieved by tests: A lower bound for generalized KR 21.** *Psychol. Rep.*, 1962, 10(1), 59-63.—"Reliability estimate (8) has been derived, using an approach suggested by Kendall, by introducing the concept of maximum test score variance. The estimate is simply calculated and practically insensitive to skewness. As total test score skewness decreases, (8) closely approaches in value either KR 21 or generalized KR 21, depending on the item scoring convention adopted throughout the test. This appears to be a desirable property for many testing problems in which enhancement of reliability by skewness is not desired, e.g., for certain item selection procedures where long initial tests and numerous potential test items are available."—*B. J. House.*

Factor Analysis

82. Bechtoldt, H. P. **Factor analysis and the investigation of hypotheses.** *Percept. mot. Skills*, 1962, 14, 319-342.—The paper deals with several basic methodological problems arising from attempts to investigate hypotheses involving abilities or factors by the methods of factor analysis. The appropriateness of these methods for several classes of hypotheses is discussed in terms of such issues as the relevance of a given statistical model for a specific empirical hypothesis, the development of a set of linearly and experimentally independent and explicitly defined variables, and the estimation and evaluation or interpretation of indices of relationship. Suggestions are made as to the integration of factor analytic procedures and the concepts of abilities or factors into the general body of statistical and behavioral theory.—*W. H. Guertin.*

83. Cattell, Raymond B., & Sullivan, William. (U. Illinois) **The scientific nature of factors: A demonstration by cups of coffee.** *Behav. Sci.*, 1962, 7(2), 184-193.—"Complete understanding of a mathematical model cannot be gained from logical analysis alone; the types of concepts which these models represent must be understood as well. The authors of this paper suggest that the nature of a model and its full implications may be made clear by applying it to a common concrete example whose properties are already fully understood. In the experiment described here, the factor analytic model is applied to that very common thing, a cup of coffee." (26 ref.)—*Journal abstract.*

84. Eyman, R. K., Dingman, H. F., & Meyers, E. C. (Pacific State Hosp.) **Comparison of some computer techniques for factor analytic rotation.** *Educ. psychol. Measmt.*, 1962, 22(1), 201-214.—Previous studies have shown both agreement and substantial differences in the solutions obtained from various factor analytic methods. 5 well-defined variables were included in 13 tests given to samples of 100 mentally retarded and 100 normal children. The 2 matrices were analyzed by (a) Zimmerman's graphic method, (b) the quartimax method, (c) the varimax solution, (d) the oblimax solution, and (e) the biquartimin solution. "The findings in this study

support the advantages of both the biquartimin and varimax methods when compared with hand graphic rotations. Still, the biquartimin solution appears to be the more generally appropriate solution if orthogonality is not demanded."—*W. Coleman.*

85. Horst, Paul. (U. Washington) **Matrix reduction and approximation to principal axes.** *Psychometrika*, 1962, 27(2), 169-178.—A modification of Hotelling's iteration method of factor analysis is presented which is much more rapid and almost as accurate. At any stage of the approximation for a factor vector its major product moment reduces the rank of the residual matrix by precisely one. Each approximation to an eigenvalue is larger than the preceding one. By observing the decline in these increments one can often stop the iterations at early stages without serious loss. If subsequent rotational procedures are used, the method gives practically the same results as the more exact methods and in a small fraction of the time.—*Journal abstract.*

86. Hurley, John R., & Cattell, Raymond B. (U. Illinois) **The Procrustes Program: Producing direct rotation to test a hypothesized factor structure.** *Behav. Sci.*, 1962, 7(2), 258-262.—This paper is concerned with the theory, mathematics, and computer implementation of rotating factor structures. The purpose is to see how well the factor patterns obtained from a given set of data fit a previously stated hypothesis as to what the factor patterns should be. (20 ref.)—*J. Arbit.*

87. MacDonald, Roderick P. (U. New England, Australia) **A note on the derivation of the general latent class model.** *Psychometrika*, 1962, 27(2), 203-206.—A general formulation of the latent structure principle is suggested, from which it is possible to derive Lazarsfeld's accounting equations in their most general form. The basic equations of Gibson's latent profile model can thence be derived in a single step.—*Journal abstract.*

88. Saunders, D. R. (Princeton, N. J.) **Integrating the implementation of quartimax, varimax, oblimax, and related rotational methods.** *Psychol. Rep.*, 1962, 10(1), 241-242.—"A computational procedure is reported which permits both quartimax and varimax to be incorporated into a typical oblimax program with a minimum of additional instructions. The existence of a new class of orthogonal rotational methods is suggested."—*B. J. House.*

GENERAL BOOKS & REFERENCE WORKS

89. Artemov, V. A. **Kurs lektsii po psikhologii.** [Course of lectures in psychology.] Khar'kov, USSR: Khar'kov Univer. Publishing House, 1958. 421 p.—A text in psychology for pedagogical institutes and for students interested not only in general psychology, but also in the specialized areas of language and thought.—*I. D. London.*

90. Brown, R., Galanter, E., Hess, E. H., & Mandler, G. **New directions in psychology.** New York: Holt, Rinehart, & Winston, 1962. ix, 353 p. \$2.50.—4 topics were selected to represent current trends in psychology: models of attitude changes (Brown), contemporary psychophysics (Galanter), ethology (Hess), and emotion (Mandler). Heterogeneous as these topics are they have one characteristic in common: the abandonment of isolated factor research. Cognitive adjustments are stressed in atti-

tude models, motivational constraints in psychophysics, integration of hereditary behavior patterns and environmental modifications in etiology, and the interaction of physiological and social variables in emotion.—*W. J. Koppitz*.

91. Candland, D. K., & Campbell, J. F. **Exploring behavior: An introduction to psychology**. New York: Basic Books, 1961. 179 p. \$4.50.

92. Fiske, Donald W., & Maddi, Salvatore R. **Functions of varied experience**. Homewood, Ill.: Dorsey, 1961. v, 501 p. \$10.60.—Several topics in the area of varied experience and its consequence for the organism are covered in the book's 15 chapters. 3 chapters ("The Forms of Varied Experience," "A Conceptual Framework," and "An Appraisal of the Proposed Conceptual Framework") are under the joint authorship of Fiske and Maddi. 2 chapters ("Effects of Monotonous and Restricted Stimulation" and "The Inherent Variability of Behavior") are by Fiske, and 2 are by Maddi ("Explosatory Behavior and Variation-Seeking in Man" and "Unexpectedness, Affective Tone, and Behavior"). The remaining chapters were contributed by 9 other authors: "Stimulation as a Requirement for Growth and Function in Behavioral Development" by Austin H. Riesen; "Early Environmental Stimulation" by William R. Thompson and Theodore Schaefer, Jr.; "Behavioral, Subjective, and Physiological Aspects of Drowsiness and Sleep" by Joe Kamiya; "An Analysis of Exploratory and Play Behavior in Animals" by W. I. Welker; "Alternation Behavior" by William N. Dember; "Motivation Reconsidered: The Concept of Competence" by Robert W. White; "Complexity-Simplicity as a Personality Variable in Cognitive and Preferential Behavior" by James Bieri; and "Beauty: Pattern and Change" by John R. Platt.—*E. Y. Borrouman*.

93. Koch, Sigmund. (Ed.) **Psychology: A study of a science. Study II: Empirical substructure and relations with other sciences. Vol. 4. Biologically oriented fields: Their place in psychology and in biological science**. New York: McGraw-Hill, 1962. xxxix, 731 p. \$12.50.—(See 37: 170, 178, 181, 192, 207, 520, 521, 524, 527, 529, 530, 533, 613, 680)—*E. Y. Beeman*.

94. McDougall, William. **Body and mind**. Boston, Mass.: Beacon, 1961. xix, 384 p. \$2.45 (paper).

95. Munn, Norman L. (Bowdoin Coll.) **Introduction to psychology**. (4th ed.) Boston, Mass.: Houghton Mifflin, 1962. xiv, 588 p. \$6.95.—This edition is shorter by 226 pages and 9 chapters than the 1961 edition, *Psychology: The Fundamentals of Human Adjustment* (see 36: 1A12M). "Most of the material is taken from the larger edition, but this is edited so as to delete certain physiological and experimental details. . . . Grouping of chapters into parts . . . has been omitted so as to provide greater flexibility." There are correlated changes in the references, glossary, appendix, and accompanying manuals.—*R. S. Harper*.

96. Russell, Claire, & Russell, W. M. S. **Human behavior**. Boston, Mass.: Little, Brown, 1961. ix, 532 p. \$6.50.—Drawing heavily on animal behavior experiments, the authors describe in the 1st section many types of automatic (nonvoluntarily controlled) behavior which prevail among all species. The automatisms in human behavior which the authors cite appear to be related to psychoanalytically oriented de-

fence concepts. A plea is made for liberating humans from these automatisms.—*G. Elias*.

97. Stinissen, J. **Geannoteerde bibliografie van tijdschriften voor toegepaste psychologie, tot einde 1960**. [Annotated bibliography of reviews of applied psychology, up to the end of 1960.] *Tijdschr. Stud.-Beroepsorient.*, 1961, 8, 122-135.—This bibliography includes British and American reviews.—*R. Piret*.

ORGANIZATIONS

98. American Psychological Association. **Instructions for the preparation of abstracts**. *Amer. Psychologist*, 1961, 16, 833.—*S. J. Lachman*.

99. American Psychological Association. **Officers, boards, committees, and representatives of the American Psychological Association: 1961-1962**. *Amer. Psychologist*, 1961, 16, 776-798.—*S. J. Lachman*.

100. American Psychological Association, Convention Committee. **Call for papers and symposia: Seventieth Annual Convention of the American Psychological Association**. *Amer. Psychologist*, 1961, 16, 730-737.—Rules and procedural instructions regarding papers and symposia at the 1962 Annual Convention to be held in St. Louis, Missouri, are specified. The kinds of programs and sessions anticipated are indicated, and an outline of the convention schedule is provided.—*S. J. Lachman*.

101. American Psychological Association, Council of Editors. **Summary report of journal operations: 1960**. *Amer. Psychologist*, 1961, 16, 834.—*S. J. Lachman*.

102. Carter, Launor F. **Proceedings of the sixty-ninth Annual Business Meeting of the American Psychological Association, Inc.: Report of the Recording Secretary**. *Amer. Psychologist*, 1961, 16, 759-773.—*S. J. Lachman*.

103. Crawford, Meredith P. **Proceedings of the sixty-ninth Annual Business Meeting of the American Psychological Association, Inc.: Report of the Treasurer**. *Amer. Psychologist*, 1961, 16, 773-775.—*S. J. Lachman*.

PROFESSIONAL PROBLEMS

104. American Board of Examiners in Professional Psychology: 1961 annual report. *Amer. Psychologist*, 1961, 16, 835-837.—*S. J. Lachman*.

105. American Psychological Association, Committee on Scientific and Professional Ethics and Conduct. **Rules and procedures**. *Amer. Psychologist*, 1961, 16, 829-832.—*S. J. Lachman*.

106. Ammons, R. B., & Ammons, C. H. **Permanent or temporary journals: Are PR and PMS stable?** *Percept. mot. Skills*, 1962, 14, 281.—The paper on which *Psychological Reports* and *Perceptual and Motor Skills* and reprints from them have been printed, along with most other journals and reprints in psychology, will become discolored and brittle in a relatively few years. This situation poses a practical problem of major proportions.—*W. H. Guertin*.

107. Braun, John R. (U. Bridgeport) **Stereotypes of the scientist as seen with the Gordon Personal Profile and Gordon Personal Inventory**. *J. Psychol.*, 1962, 53(2), 453-455.—In 1961 42 Texas Christian University students took either the Gordon

Personal Profile or Gordon Personal Inventory under sets to answer as would a typical scientist or a typical business executive. The resulting stereotype of the scientist was found to be quite similar to that found by Bendig and Hountras in 1958 with University of Pittsburgh students.—*Author abstract.*

108. Broadhurst, P. L. (U. London) **Coordinate indexing: A bibliographic aid.** *Amer. Psychologist*, 1962, 17, 137-142.—"The procedure involves setting up a separate card file to index the collection of references, these being filed irrespective of author or content but merely according to a serial number assigned to each reference as it is added—technically the accession number. The classification of the reference is done by selecting certain words and underlining them ('tracing'). By coincidences of numbers on Uniterm cards (cards containing key words), references can be selected dealing with 2, 3, or more topics. The method is mechanical, simple, cheap, and can accommodate a variety of material.—S. J. Lachman.

109. David, Henry P. (New Jersey State Dept. Institutions & Agencies, Trenton) **New Jersey vignettes: Fifty years of state psychological services.** *Amer. Psychologist*, 1962, 17, 53-54.—"New Jersey State Psychological Services began on October 1, 1910, when J. E. Wallace Wallin left . . . Vineland . . . to open a Psychological Laboratory at the New Jersey Village for Epileptics . . . near Princeton. . . Edgar A. Doll became New Jersey's first State Chief Psychologist, 1919-23." Psychological services expanded greatly by the end of the postwar decade. Internships in clinical psychological services and research have been available since the early 20s. At present there are over 100 state psychology positions in correctional centers, mental hospitals, and training schools.—S. J. Lachman.

110. David, Henry P., & Swartley, William M. (New Jersey State Dept. Institutions & Agencies, Trenton) **Toward more effective international communication in psychology.** *Amer. Psychologist*, 1961, 16, 696-698.—Psychologists "have given relatively little attention to new techniques of selective electric dissemination of scientific papers, micropublication, and mechanized retrieval of stored information. . . . It is already technically feasible and financially practical to publish most everything any psychologist believes might be of value to a colleague within a week of manuscript availability. Furthermore, it is now possible to selectively distribute an abstract of each paper within another week to every psychologist anywhere in the world who has previously expressed an interest in the specific content area. Immediate and exhaustive publication involves no more than photographing manuscripts and reproducing them as microarticles on a single 3 × 5 inch file card. Very lengthy articles, exceeding 140 double spaced pages, might require a second card."—S. J. Lachman.

111. Eiduson, Bernice T. (U. Southern California) **Scientists: Their psychological world.** New York: Basic Books, 1962. xiv, 299 p. \$6.50.—This attempt of finding characteristic traits in the personalities of scientists is based on interviews of 40 research scientists from California Universities. The Rorschach and TAT yielded supplementary information. While no specific emotional traits could

be detected, scientists revealed much similarity in the areas of cognitive and perceptual organization.—W. J. Koppitz.

112. Gullahorn, John T., & Gullahorn, Jeanne E. **Visiting Fulbright professors as agents of cross-cultural communication.** *Sociol. soc. Res.*, 1962, 46(3), 282-293.—Theoretical considerations concerning interactions among group members of relatively high and equal status, as well as the conditions accompanying the role of the stranger, lead to the conclusion that visiting professors in the International Educational Exchange Program have a uniquely favorable opportunity to become agents of cross-cultural communication. Data from a questionnaire and interview survey of American Fulbright and Smith-Mundt grantees support this view. Examples are cited of the interactions with foreign colleagues and others engaged in by social scientists, natural scientists, and humanists; and certain differences among the 3 categories are noted. It is postulated that the frequency and quality of interactions, both while abroad and after return home, depend largely on the exchange professors' skill in discerning and using the reference groups appropriate to the situation.—*Journal abstract.*

113. Hollyer, Stewart Gordon. (U. Nebraska) **Social status factors and achievement needs as related to entry into a professional field.** *Dissert. Abstr.*, 1961, 21(12), 3844.—*Abstract.*

114. Kahn, Marvin W., & Santostefano, Sebastian. (U. Colorado School Medicine) **The case of clinical psychology: A search for identity.** *Amer. Psychologist*, 1962, 17, 185-189.—Clinical psychology presents itself in a state of chronic anxiety, great ambivalence, insecurity, and self-doubt. "Clinical psychology is confused concerning its identity. The 'role of the internship in the training of clinical psychologists is a crucial one.' It should provide a clear example of the role model the clinician will eventually be expected to assume. 'Both academic departments and internship training centers must assume fully their responsibility for training clinical students in the role society demands of them.'—S. J. Lachman.

115. Kappel, Frederick B. (American Telephone & Telegraph) **Education for scientific careers in industry.** *Teachers Coll. Rec.*, 1962, 63(8), 614-622.—"The people who can grow and take responsibility and make big contributions are the self-developers." At American Telephone and Telegraph the research man is free to work at things chosen by him, he may carry on the work to the point where development men can take over and free him for further research, and he may promptly publish his findings. A broad education is the best preparation.—H. K. Moore.

116. Krasner, Leonard. (Stanford U.) **Behavior control and social responsibility.** *Amer. Psychologist*, 1962, 17, 199-203.—"It is in the field of psychotherapy that the issues of the moral and ethical implications of behavior control first arose as a relevant problem." We "cannot avoid facing the issue of values." Psychology should "develop techniques of approaching experimentally the basic problem of social and ethical issues involved in behavior control." In connection with this, the psychologist-researcher "should undertake the task of contact with the public rather than leaving it to sensationalists and

popularizers." Behavior control "represents a relatively new, important, and very useful development in psychological research."—S. J. Lachman.

117. Lysenko, N. F. (Kherson) *Charl'z Darwin o kachestvakh uma uchenogo*. [Charles Darwin on the scientist's mind.] *Vop. Psikh.*, 1961, No. 5, 154-158.—"Research work, apart from high moral and physical tension, requires some special properties of the mind. The present paper is an attempt to answer the question as to the qualities of the mind necessary for research work. By studying the works and scientific activities of Charles Robert Darwin the author presents an analysis of such qualities of the scientist's mind as a tendency to generalization and reasoning. The article also dwells on the critical nature of Charles Darwin's mind."—H. Pick.

118. Moreno, J. L. *Code of ethics for group psychotherapy and psychodrama: Relationship to the Hippocratic Oath*. New York: Beacon House, 1962, 29 p.—Moreno's "Code of Ethics" and "Group Oath" (the latter appearing originally in *Group Psychotherapy*, 1955, 8, 357) are reprinted along with a number of responses.—E. L. Borrowman.

119. President's Science Advisory Committee, Life Sciences Panel, Behavioral Sciences Subpanel. *Strengthening the behavioral sciences*. Washington, D. C.: United States Government Printing Office, 1962. 19 p. \$15.—The report includes examples of some of the many types of research that is being carried on in the behavioral sciences. It identifies certain needs which must be met if the scientific study of behavior is to continue to develop and makes suggestions as to how they might be met.—E. L. Borrowman.

120. President's Science Advisory Committee, Life Sciences Panel, Behavioral Sciences Subpanel. *Strengthening the behavioral sciences*. *Science*, 1962, 136(3512), 233-241.—(See 37: 119).

121. Ratner, Stanley C. (Michigan State U.) *The role of psychology in the traveling science teacher program for high schools*. *Amer. Psychologist*, 1961, 16, 702-704.—The program at Michigan State University involved training 20 secondary school science teachers during a 3-month period, and included 14 hours of lectures in psychology. It "yielded 16 lecture-demonstrations suitable for presentation at the secondary school level" by the science teachers, each of whom developed a "psychobiology" lecture-demonstration. "The demonstrations, which were used to accompany the lecture, were originally selected for a variety of reasons" including simplicity of material, portability of material, and opportunity for student participation. 2 demonstrations were described. The lecture developed by the science teachers on psychobiology was "presented to a total of 565 groups of students and other interested audiences."—S. J. Lachman.

122. Rohrer, Wayne C., & Motz, Annabelle B. *Presidency in three learned societies: Social characteristics and modes of accession to office*. *Sociol. soc. Res.*, 1962, 46(3), 271-281.—The Presidency in 3 learned societies is viewed from the standpoint of (a) who becomes president, and (b) what route does the person follow in achieving the presidency. Facets of several social characteristics (age, academic training, job location, and publication) are considered. The mode of accession is presented in terms of or-

ganizational maintenance, professional competence, and strategic location in the occupational structure.—*Journal abstract.*

Psychological Personnel

123. Adams, James F., & Jenkins, Peter H. (Temple U.) *The psychological marketplace*. *Amer. Psychologist*, 1962, 17, 208-209.—At a meeting of the Eastern Psychological Association "there were 206 applicants for 125 academic positions, 157 applicants for 467 clinical and counseling positions, and 163 applicants for 198 industrial and research positions." There are "more jobs available than there are psychologists to fill them in the total employment picture." While "the degree requirements are the lowest for the Industrial and Research area, the median starting salary is the highest. The converse is true for the academic positions."—S. J. Lachman.

124. American Psychological Association. *Distinguished Scientific Contribution Awards: 1961*. *Amer. Psychologist*, 1961, 16, 799-807.—Distinguished Scientific Contribution Awards of the APA were presented to James Jerome Gibson, Donald Olding Hebb, and Henry Alexander Murray. The formal citation accompanying the award, a photograph, a brief professional biography, and a bibliography of scientific publications are included for each award recipient.—S. J. Lachman.

125. Boring, Edwin G. (Harvard U.) *Psychologist at large*. New York: Basic Books, 1961. 371 p. \$6.50.—An autobiography about twice the length of that published under the editorship of Carl Murchison in 1952. It now includes the decade 1950-60, and contains 9 selected letters (out of his file of about 40,000) written to Koffka, Hans Sachs (Boring's psychoanalyst), Bartlett, Skinner, Terman, and Yerkes. 13 selected papers and his bibliography round out the volume. The papers range from "The Woman Problem," through "The Moon Illusion," to "Psychological Factors in the Scientific Process."—T. J. Banta.

126. Ehrle, Raymond A., & Johnson, Bob G. (Pennsylvania Rehabilitation Center) *Psychologists and cartoonists*. *Amer. Psychologist*, 1961, 16, 693-695.—"To assess one component of the public image of the psychologist . . . the present writers have theorized that a content or thematic analysis of cartoons might be relevant." An analysis of 4760 cartoons contained in 6 popular magazines for the years 1949 and 1959 led to the conclusions that: (a) considerable overlap in public image does occur between psychologists, psychiatrists, and other psychologically oriented personnel; (b) psychology as a science and as a profession does not appear to excite the public imagination and generate public interest; (c) psychology has kept pace with members of various other professions and occupations; (d) the psychologist does not seem to have any distinctive identifying symbol which he can easily claim as his own.—S. J. Lachman.

127. Grether, Walter F. (Behavioral Sciences Lab., Wright-Patterson AFB) *Psychology and the space frontier*. *Amer. Psychologist*, 1962, 17, 92-101.—Psychology and psychologists have made important contributions "generally in the selection of astronauts, the determination of astronaut capabilities

and design of the work station to match these, and the design of training equipment and methods for astronaut training. . . . Psychology as a science has a vital role to play in the conquest of space. . . . Psychologists have responded with vigor and imagination to the challenging problems of space flight. . . . The space flight challenge brings with it the stimulation of new ideas and opens opportunities for new types of research on human behavior. . . . Psychology has much to gain in the form of new knowledge, and also, in status as a science, from its participation in the push into space."—S. J. Lachman.

128. Hirt, Michael. A career as a psychologist. Cambridge, Mass.: Bellman, 1962. 26 p. \$1.00.—Psychology is characterized as both a profession and a science. The divisions of the American Psychological Association and Shartle's 28 speciality titles are listed to illustrate the various specialities within psychology. Figures are provided indicating that there are over 20,000 psychologists with 36% employed in colleges. Other major settings are also given. The future outlook and personal requirements are discussed briefly. Preparation is described with emphasis on graduate training. Data are supplied showing the income of psychologists by type of employment and age level. Occupational relationships are mentioned. Requirements for certification or licensing are cited, and a somewhat dated list of regional and state psychological associations is provided. The journals published by the American Psychological Association are listed as sources of further information. (36 ref.)—W. Coleman.

129. Rice, George P. (Butler U.) The psychologist as expert witness. *Amer. Psychologist*, 1961, 16, 691-692.—"Is psychology sufficiently established at this time as a science to qualify its practitioners as expert witnesses in civil and criminal trials in federal and state courts. . . ? If so, does a need exist for their services in this capacity? . . . The purpose of this brief . . . [article] is to survey the domain, defining terms, show how the psychologist might be qualified in an actual trial, point out methods of obtaining his testimony, and suggest legislative action along broad lines." The major sections are: Definitions, Qualification as a Witness, Methods of Taking Testimony, and Suggested Legislation.—S. J. Lachman.

130. Wallin, J. E. Wallace. (Wilmington, Del.) PhDs in psychology who functioned as clinical psychologists between 1896 and 1910. *Psychol. Rec.*, 1961, 11, 339-341.—The names and other information were obtained by the author through questionnaire (1913), extensive correspondence and examination of college catalogues, first-hand observation at many institutions and in many school systems (1910-12), and recent communication (1960).—R. J. Seidel.

131. Woods, Paul J. (Hollins Coll.) Some characteristics of journals and authors. *Amer. Psychologist*, 1961, 16, 699-701.—Some characteristics of authors in 10 American Psychological Association journals and 9 other selected psychological journals are presented in a table. The "number of authors who are not affiliated with the APA is rather surprising although many of these may be students. The total proportion of non-APA members for the APA journals is .23 and for the others .28." Approximately "one-quarter to one-third of the authors

throughout have no divisional affiliation. . . . All of the journals studied contained authors who were members of the Psychonomic Society. The APA journal with the highest proportion in this group was *Psychological Review*," and the next highest was the *Journal of Experimental Psychology*. Slightly more than $\frac{1}{2}$ of the articles are by individual authors and about $\frac{1}{2}$ are by 2 authors.—S. J. Lachman.

Training in Psychology

132. Brayfield, Arthur H., Dipboye, Wilbert J., Johnson, Walter E., Robinson, Francis P., Super, Donald E., & Landy, Edward. The scope and standards of preparation in psychology for school counselors. *Amer. Psychologist*, 1962, 17, 149-152.—"This report asserts that psychology is central to the training of school counselors. The recommendations are designed to be guidelines for colleges of education, psychology departments, school systems, state departments of public instruction, the United States Office of Education and professional associations interested in the training and professional development of school counselors." The major sections are: Principles Relevant to Professional Preparation of the School Counselor and to His Effective Functioning, Content Areas in the Field of Psychology, Implications of the Report, and Pertinent Reports and Publications.—S. J. Lachman.

133. Darley, John G. (American Psychological Ass.) Report of the executive officer: 1961. *Amer. Psychologist*, 1961, 16, 755-758.—Psychologists "must continue to speak to college students, and with greater effectiveness than may be true at present." American Council on Education evidence "suggests that psychology, against the index year of 1955, may be losing ground proportionately as an undergraduate major field. . . . If we fail in creating an adequate perception of psychology among college students, we may mortgage our future beyond redemption." In governmental affairs "psychology's voice . . . is not as clear nor its message as self-assured as the voices of other scientists and scholars." The factors influencing processes in which the APA Central Office becomes involved are considered briefly.—S. J. Lachman.

134. McKeachie, Wilbert J., & Millholland, J. E. (Eds.) (U. Michigan) Undergraduate curricula in psychology. Chicago, Ill.: Scott, Foresman, 1961. 115 p. \$2.00.—Report of a summer conference. Besides contributions by the editors (who served as conference directors), there are also papers by L. E. Cole, W. A. Hunt, R. Leeper, W. Ray, R. L. Isaacson, J. V. McConnell, and E. L. Walker. Major topics: experience with Wolfe curriculum; pressures on the curriculum, professional and vocational training, the beginning course, the experimental-statistical area, 3 model curricula for the major, and suggestions for research. Annotated bibliography.—C. T. Morgan.

135. Ross, Sherman. (American Psychological Ass.) Educational facilities and financial assistance for graduate students in psychology: 1962-63. *Amer. Psychologist*, 1961, 16, 808-828.—Varying degrees of information are given about application requirements, requirements for admission, tuition, types of assistantships, stipends, Veterans Administration traineeships, National Defense Education Act fellowships, United States Public Health Service stipends, etc., for each of 184 institutions.—S. J. Lachman.

136. Ryckman, Marjorie. (U. Missouri) Graduate training in psychology: The trend in specialization at the master's level. *Amer. Psychologist*, 1962, 17, 143-145.—Should the master's degree be a terminal degree of a steppingstone to the doctorate? The question of specialization at this level also enters the picture. Data from published research of other investigators indicate that "for each field in which the Master's is offered in both 1951-52 and in 1961-62 not only has the percentage of schools offering it sharply decreased but also . . . the absolute number is less." As compared with 1951, the 1961 figures "show that Masters' in the major fields of psychology are offered in fewer schools today, and a large number offer no Master's at all. . . . The number and percentages of schools offering no Master's degrees in psychology has more than tripled in the ten-year period."—S. J. Lachman.

PSYCHOLOGY ABROAD

137. American Psychological Association. Report on translations of Russian psychological literature. *Amer. Psychologist*, 1962, 17, 155-156.—"With APA's increasing concern for the problem of translations from the Russian in the field of psychology and related areas, some groundwork has been done in an effort to collect as complete a bibliography as possible, together with a list of sources for the material. . . . The report consists of sources for known materials, a bibliography, and a listing of ongoing research, partly translations and partly reviews and evaluations of articles in Russian on various aspects of psychology."—S. J. Lachman.

138. American Psychological Association, Committee on Psychology in National and International Affairs. Psychology in national and international affairs: A progress report. *Amer. Psychologist*, 1962, 17, 50-52.—The committee has been directed to concern itself with "(a) examining international and related national issues for those aspects to which the special competencies of psychologists may be applied; (b) initiating and coordinating actions approved by the Board and Council, which are likely to encourage such applications; (c) maintaining liaison with APA boards, committees and divisions, and other individuals and organizations. . . . Subcommittees are at work in several realms."—S. J. Lachman.

139. Anon. Prisuzhdenie E. A. Asratianu zolotoi medalii im. I. P. Pavlova. [The award of the Pavlovian gold medal to E. A. Asratian.] *Vestn. Akad. Nauk SSSR*, 1962, 32(2), 105.—A short account is given of Asratian's contributions to a deeper understanding of conditioned-reflex theory, along with his portrait and the reproductions of the 2 sides of the gold medal awarded to him by the USSR Academy of Sciences.—I. D. London.

140. Kaplan, Alex H. (Washington U.) Trends in Soviet psychiatry. *Ment. Hyg., N. Y.*, 1962, 46, 20-30.—A review of the relationship of Soviet government philosophy to Soviet psychiatry and a report of the incidence of mental illness in the Soviet Union are presented. Discussions of research trends and Pavlovian psychotherapy treatment procedures are also included.—M. H. Lewin.

141. Kostjuk, P. G. U fiziologov Avstralii. [With the physiologists of Australia.] *Vestn. Akad.*

Nauk SSSR, 1962, 32(2), 84-87.—The author describes the neurophysiological research being conducted in Australia.—I. D. London.

142. Mitra, S. C. (Indian Inst. Social Welfare & Business Management, Calcutta) Biographical sketch. *Psychol. Stud., Mysore*, 1961, 6(1), 1-9.—Autobiographical notes, mainly referring to the development of psychology in India, are given.—U. Pareek.

143. Nuttin, Joseph. (U. Louvain, Belgium) Psychology in Belgium. Louvain, Belgium: Publications Universitaires, 1961. 80 p. \$1.60.—A concise history of psychology in Belgium serves as an introduction to an outline of current trends in Belgian psychology, with centers in the universities of Brussels, Ghent, Liège, and Louvain.—W. J. Koppits.

144. Pick, Herbert L., Jr. (U. Wisconsin) Research on taste in the Soviet Union. In Morley R. Kare & Bruce P. Halpern (Eds.), *The physiological and behavioral aspects of taste* (see 37: 256). Pp. 117-126.—A review of research in the USSR. "Soviet contributions . . . have been rather of a methodological than a substantive nature, particularly the unconditioned- and conditioned-reflex methods as well as the modification of the one-bottle method. In addition, imaginative work has been started on such variables as oxygen deficiency, external temperature, and occupational setting."—E. Y. Beeman.

145. Russell, Roger W. Applied psychology: 1961. *Nord. Psykol.*, 1962, 14(1), 1-5.—A report on the XIV International Congress of Applied Psychology held in Copenhagen from August 13 to 19, 1961.—L. Goldberger.

146. Samarin, IU. A. et al. (Eds.) Materialy leningradskoi zonal'noi psikhologicheskoi konferentsii. [Materials of the Leningrad Regional Psychological Conference.] Leningrad, USSR: No publisher indicated, 1958. 106 p.—Abstracts are provided of papers read at the Leningrad Regional Psychological Conference in May 1958. The papers are grouped under the headings: general problems of psychology, sensation and perception, thinking, speech and language, needs and interests, capabilities, the psychology of work, the psychology of sport, and pathological psychology.—I. D. London.

147. Sandström, Carl Ivar. The Scandinavian Journal of Psychology: Tillkomst och en blick framåt. [The Scandinavian Journal of Psychology: Its inception and a look forward.] *Nord. Psykol.*, 1961, 13(6), 273-280.—A brief description of the formation of the English-language journal published in Scandinavia with an evaluation of its 1st year of operation.—L. Goldberger.

148. Shustin, N. A. Put' sovetskoy kosmicheskoy fiziologii. [Advances in space physiology in the Soviet Union.] *Fiziol. Zh. SSSR*, 1961, 47(10), 1217-1226.

149. Sjölund, Arne. (Pedagogic Inst. Denmark) Psykologien i sovjetunionen. [Psychology in the Soviet Union.] *Nord. Psykol.*, 1961, 13(7), 299-331.—An overview of Soviet psychology with a discussion of its place and significance in Soviet society. Based on an extensive review of the relevant literature in the western languages and several short visits to the USSR. (121 ref.)—L. Goldberger.

150. South African Psychological Association. *Proceedings: 1958-1960. Proc. S. Afr. Psychol. Ass.*, 1958-60, No. 9-10. 36 p.—Some of the papers read at the congresses held in 1958 and in 1960 are included, along with summaries or abstracts of others. Several are in English.—E. L. Borrowman.

151. Tollingerová, D. (ČSAV Prague) *Bibliografie české a slovenské psychologické literatury pro rok 1960*. [Bibliography of Czech and Slovak psychological literature in 1960.] *Ceskoslov. Psychol.*, 1961, 5, 387-394.—254 items of Czechoslovak psychological literature published during 1960 are presented.—V. Břicháček.

152. Vatsuro, E. G. *O nekotorykh fiziologicheskikh mekhanizmaxh otrazheniia i razvitiia ikh v protsesse évoliutsii*. [On several physiological mechanisms of reflection (of reality) and their development in the process of evolution.] *Vop. Fil.*, 1962, 16(1), 54-61.—The author, in developing his discussion of the evolution of adequate reflection of reality in organisms, does so on the basis of Pavlovian theory and Lenin's theory of reflection.—I. D. London.

EXPERIMENTAL PSYCHOLOGY

153. Gregory, A. H., & Devine, J. H. (U. Hull) *An electronic stimulus randomizer. Quart. J. exp. Psychol.*, 1962, 14(2), 122-124.—A circuit is described which enables 2 stimuli to be presented in random sequence with either equal or different probabilities. The choice of stimuli is determined by sampling the condition of a 2-state circuit. Experimental tests of randomness have been satisfactory.—*Journal abstract*.

154. MacLeod, Robert B. (Cornell U.) *What is a sense?* In Morley R. Kare & Bruce P. Halpern (Eds.), *The physiological and behavioral aspects of taste* (see 37: 256). Pp. 1-5.—A brief history of the study of sensations.—E. Y. Beeman.

155. Uttal, William R. (International Business Machines, Yorktown Heights, N. Y.) *The use of a summary card-punch to generate stimuli and to collect data simultaneously. Amer. J. Psychol.*, 1962, 75(1), 150-151.—The Summary Punch of the IBM 526 was modified to carry out the 2 functions simultaneously. "... this device has been used for controlling random presentation of varying current-levels to nerves, but its application obviously is much wider."—R. H. Waters.

PSYCHOPHYSICS

156. Anthony, W. S., Holding, D. H., Lion, Judith S., & Sluckin, W. (U. Durham) *Size-weight interaction in judgments of compound stimuli. Quart. J. exp. Psychol.*, 1962, 14, 77-88.—"Three sets of stimulus objects were prepared. Variation of weight was the same in each set. However, the size of the objects was the same in one set, while in another set size increased with weight, and in a third set size and weight were negatively correlated. Three groups of 16 subjects were asked to make replicated absolute judgments of the weights in each set. It appeared that judgments of weight are more affected by density when density varies than when changes of size produce constant density. As predicted, contrast between successive stimuli is greatest

when size and weight are negatively correlated, and least with positive correlation. The extent of the judged scales, and the means of these scales, follow the same pattern. Differences in discriminability between the three series whilst in the expected direction, are not significant. The hypothesis that these effects would be more apparent in the psychologically linked dimensions of size and weight, than in the relatively neutral case of size and brightness, was largely confirmed."—E. Y. Borrowman.

157. Beck, Jacob, & Shaw, William A. (Harvard U.) *Magnitude estimation of pitch. J. Acoust. Soc. Amer.*, 1962, 34, 92-98.—Using the method of magnitude estimation, the effect of the frequency of the standard upon the pitch functions for piano tones and randomly chosen pure tones was investigated. When the frequency of the standard was the lowest tone presented, the magnitude estimations yielded a function similar to the revised mel scale, and when the standard was a frequency nearer the middle of the series, the magnitude estimations yielded a steeper function closer to the original mel scale. Data show that the numerical value of the standard can affect the magnitude estimation function. The response biases relating to the frequency and numerical value of the standard may be expected to influence the pitch function determined by magnitude estimations. The nature and effect of these biases are discussed.—A. M. Small, Jr.

158. Crawford, Billy M. (Aerospace Medical Lab.) *Measures of remote manipulator feedback: Differential sensitivity for weight. USAF WADD tech. Rep.*, 1961. No. 60-591. 15 p.—The psychophysical Method of Constant Stimulus Differences was used to determine difference thresholds and Weber ratios for both direct and remote lifting of 2 standard weight stimuli. A Model 8 Master-Slave Manipulator was used for remote lifting. For a 100-gm. weight, difference thresholds were 65.42 and 110.45 gm. for direct and remote lifting, respectively. Corresponding difference thresholds for a 3000-gm. standard were 149.33 and 195.69 gm. The difference threshold indicates the fineness of weight discrimination which can be expected of a worker. Increases in difference thresholds as a function of remote lifting reflect the loss of "feel" associated with remote handling. The difference threshold is proposed as a criterion of the fidelity of cues reflected to the operator by the remote-handling system.—*USAF WADD*.

159. Goldstone, S., Goldfarb, J., Strong, J., & Russell, J. *Replication: Effect of subliminal shock upon judged intensity of weak shock. Percept. mot. Skills*, 1962, 14, 222.—Published research suggested that below threshold shocks acted as anchors upon intensity judgments of stronger shocks. 2 studies attempting better control of irrelevant variables are reported. The 1st failed to affirm anchor effects but the 2nd lead the authors to state that, "It is likely that subthreshold anchors effect the judgment of suprathreshold inputs but this influence is subtle."—W. H. Guertin.

160. Lukaszewski, J. S., & Elliott, D. N. (Wayne State U.) *Auditory threshold as a function of forced-choice technique, feedback, and motivation. J. Acoust. Soc. Amer.*, 1962, 34, 223-228.—"Shifts in the threshold of hearing were determined as a function of prolonged testing (12 sessions) with 4 experimental groups: forced-choice-feedback, no-forced-

choice-feedback, forced-choice-no-feedback, and no-forced-choice-no-feedback. The forced-choice technique was found to improve performance if used with immediate knowledge of results (feedback). Otherwise, thresholds obtained under a forced-choice procedure were poorer than those obtained under no-forced-choice instructions.—A. M. Small, Jr.

161. Mallick, A. K. (Calcutta U.) **An experiment in the applicability of some psychophysical laws.** *MANAS, Delhi*, 1961, 8, 11-14.—Of the various psychophysical laws, Fullerton-Cattell's square root law proved to provide the better explanation of the data.—U. Pareek.

162. Mallick, A. K. **Verification of Guilford's generalised psychophysical law.** *Psychol. Stud., Mysore*, 1962, 7(1), 16-22.—3 psychophysical laws (Weber's law, Fullerton-Cattell's square root law, and Guilford's n th Power Function) were tested in a psychophysical experiment on temporal estimation. Guilford's law was found to be the most satisfactory.—U. Pareek.

163. Meissner, W. W. (Woodstock Coll.) **The problem of psychophysics: Bergson's critique.** *J. gen. Psychol.*, 1962, 66, 301-309.—The critique of psychophysics presented in Henri Bergson's *Time and Free Will* is presented in regard to quantification of psychic states and the measurement of sensation. Bergson regarded psychic states as characterized by qualitative heterogeneity. The basic defect of psychophysical methods is that they eliminate the qualitative dimension of psychic experience by interpreting the intensity of psychic states in terms of the quantifiable aspects of objective physical stimuli. The relevance of Bergson's critique to the efforts of modern psychophysics is suggested.—Author abstract.

164. Mulholland, T. B. **Methods of limits and implicit standards: A comment on two experiments.** *Percept. mot. Skills*, 1962, 14, 283-290.—The application of the methods of limits relative to implicit standards was critically evaluated using 2 experiments on the visual vertical as examples. It was concluded that, when variable explicit stimuli are adjusted to implicit standards, the range of equality (analogous to DL obtained by the method of limits) should be measured. The data may be efficiently analyzed using the frequency procedure because it recovers more information than the traditional procedure.—W. H. Guertin.

165. Rambo, William W., & Watson, Robert W. (Oklahoma State U.) **An empirical comparison of two theories of judgment.** *J. gen. Psychol.*, 1962, 66, 235-240.—This study compares theories of judgment developed by Helson and Johnson when applied to judgments of length. First, judgments of a rectangular distribution of lengths were obtained followed by a series of judgments of a positively or negatively skewed distribution. For all distributions, the results indicated a closer approximation of the data with the Johnson formulation.—Author abstract.

166. Sokolov, E. N., & Mikhalevskaya, M. B. (Moscow U.) **Izmerenie effektivnosti deistviya mnogokratno nanosmogo razdrashitel'ya.** [Measurement of the effectiveness of a repeatedly present stimulus.] *Vop. Psikh.*, 1961, No. 5, 183-188.—2 mathematical techniques for evaluating the effectiveness of a near threshold stimulus in evoking a reac-

tion (e.g., EEG) were described. The 1st is an application of Bayes' theorem in which the conditional probability of a stimulus having been presented (given that a particular response occurred on a given trial) is estimated on the basis of a priori probabilities of responses occurring (given the stimulus). The 2nd method uses entropy as an index of effectiveness of the stimulus. The lower the entropy ($H = -\sum P \log P$) the more effective the stimulus. Finally a chi square criterion for assessing the reliability of the change of entropy is described.—H. Pick.

167. Stevens, S. S. (Harvard U.) **The surprising simplicity of sensory metrics.** *Amer. Psychologist*, 1962, 17, 29-39.—"Is there a single, simple, pervasive psychophysical law? Unlikely as it may seem, there appears to be such a law. Its form is a power function, and not the logarithmic relation that is almost universally cited in textbooks. . . . The psychophysical power law relating the psychological magnitude to the physical stimulus can be written $\psi = k(\phi - \phi_0)^n$ where k is a constant determined by the choice of units. The exponent n varies with the modality, and also with such parameters as adaptation and contrast." Major sections are: Evidence for the Power Law, Cross-Modality Validations, Difficulties and Impediments, Reasons for Curvature in the Loudness Function, Perturbations, and Parametric Explorations.—S. J. Lachman.

168. Warren, Richard M., & Poulton, E. C. (Shimer Coll., England) **Ratio- and partition-judgments.** *Amer. J. Psychol.*, 1962, 75(1), 109-114.—"The present study was designed as a direct test for the validity of Stevens' claim that psychophysical ratio- and partition-judgments are fundamentally different. It was found that these judgments are equivalent when comparable experimental conditions are used for lightness-judgments of gray papers. It is considered that an erroneous distinction between ratio- and partition-judgments has resulted from failure to consider artifacts introduced by incidental differences in experimental procedure."—R. H. Waters.

PERCEPTION

169. Arana, L. (Moscow State U.) **Vospriyatie kak veroyatnostnyi protsess.** [Perception as a probabilistic process.] *Vop. Psikh.*, 1961, No. 7, 47-62.—In the present investigation a square grid was subdivided into a matrix of square sectors. Each sector could be "filled" or "empty," thus potentially defining a large number of patterns. The patterns used here were letters of the Russian alphabet. Ss were required to identify these letters by tactually scanning the grid. The experiments were designed to investigate the effect of the nature and accuracy of scanning behavior of (a) differential knowledge of the alternative patterns that might be presented and (b) differential numbers of possible patterns. Results indicate that scanning time decreases rapidly with practice for all numbers of alternatives used. This decrease in time is associated with a change of scanning behavior that evolves as Ss become acquainted with the alternative letters. Scanning movements are focused on those sectors having the highest probability of differentiating between the various alternatives. In early stages of practice, and even

in later stages when the alternatives are not delimited by instruction, Ss make unnecessary scanning movements apparently to check on the possibility that new letters have been introduced. Increasing the number of alternatives also has the effect of increasing superfluous scanning movements. Gradually increasing the number of alternatives preserves scanning strategies developed by the Ss.—*H. Pick.*

170. Attneave, Fred. (U. Oregon) **Perception and related areas.** In Sigmund Koch (Ed.), *Psychology: A study of a science. Vol. 4* (see 37: 93). Pp. 619-659.—In relating "various phenomena that are called perceptual" to one another and to other psychological phenomena the essay examines the areas of: "Perception and Psychophysics," and "Perception and Learning." Relevant research is summarized and theoretical positions are presented. (82 ref.)—*E. Y. Beeman.*

171. Breland, Keller, & Breland, Marian. (Animal Behavior Enterprises, Hot Springs, Ark.) **The misbehavior of organisms.** *Amer. Psychologist*, 1961, 16, 681-684.—"In our attempt to extend a behavioristically oriented approach to the engineering control of animal behavior by operant conditioning techniques, we have fought a running battle with the seditious notion of instinct." Several instances of persistent nonreinforced behavior which interfere with learning "represent a clear and utter failure of conditioning theory." Persistent "behaviors to which . . . animals drift are clear-cut examples of instinctive behaviors. . . . It seems obvious that these animals are trapped by strong instinctive behaviors, and clearly we have here a demonstration of the prepotency of such behavior patterns over those which have been conditioned." In recent years "ethological facts and attitudes . . . have done more to advance our practical control of animal behavior than recent reports from American 'learning labs.'"—*S. J. Lachman.*

172. Carterette, Edward C., & Cole, Michael. (U. California, Los Angeles) **Comparison of the receiver-operating characteristics for messages received by ear and by eye.** *J. Acoust. Soc. Amer.*, 1962, 34, 172-178.—Ss were presented with equal-length words under 2 conditions of reception: (a) by ear, against a background of white noise; and (b) by eye, for a brief period in a tachistoscope. For each word presented, the S recorded a message and, immediately following, gave a confidence rating with respect to his accuracy of reception. The similarities between the functions for the auditory and visual modes of reception were marked. It was found that for both auditory and visual presentation the accuracy of reception was (a) directly related to the confidence rating, (b) relatively invariant over a range of signal-to-noise ratios, and (c) not impaired by the task of rating.—*A. M. Small, Jr.*

173. Fraisse, P., & Blancheteau, M. (Sorbonne, Paris) **The influence of the number of alternatives on the perceptual recognition threshold.** *Quart. J. exp. Psychol.*, 1962, 14(1), 52-55.

174. Fraisse, Paul. **Influence de la durée et de la fréquence des changements sur l'estimation du temps.** [Influence of duration and frequency of changes in time estimation.] *Année psychol.*, 1961, 61, 325-339.—In sound and visual stimulation, as in tapping, an increase in the frequency of stimulation

leads to an overestimation of duration. No effect due to frequency is found unless frequency as such is perceived. The estimation of time depends on the duration of changes, on their number and on the intervals between the slides presented.—*G. Rubin-Rabson.*

175. Francès, Robert. **Les modifications perceptives en fonction du sens objectal des contenus.** [Perceptual modification as a function of context.] *J. Psychol. norm. pathol.*, 1961, 58(1), 65-96.—This is a chapter in the author's forthcoming book on perceptual development (see 37: 176). The following topics are discussed: projection, significance and knowledge in perception, apparent movement and internal dynamics of figures, effects of context on formal organization, size and distance, and memory colors. (64-item bibliogr.)—*M. L. Simmel.*

176. Francès, Robert. **Le développement perceptif.** [The development of perception.] Paris, France: Presses Universitaires France, 1962. 279 p. NF 16.—The philosophical and biological problems connected with perception are briefly examined. The research extends to both life and laboratory situations, contrasting the influences of learning and frequency mechanisms with the effects of the functions of attention, habit, language, affectivity, context, interests, and motivation. The attitudes of the psychopathic person and divergent reactions to taboos are also considered. There is, however, a controversy, regarding the types of inference to which the development of perceptions leads. Can the conative, affective, and cognitive aspects be rigorously separated? There is a constant interrelation of the composing interior-exterior and proprioceptive factors. Only the theoretical discussion of the stimulus-response theory helps to solve this problem: the conscious perception is itself a kind of response, which emerges across one or several verbal, motor, electrodermic, etc. responses, so that the operational schema of the perception is $S \rightarrow R \rightarrow R_p$ instead of simple $S \rightarrow R$. Among the opposing theories, one of special interest is Postman and Brunner's. They see the special task of the developing perception in identification, whereas according to Gibson it is directed towards discrimination. (408-item bibliogr.)—*M. Haas.*

177. Goldstein, Michael J. (U. California, Los Angeles) **A test of the response probability theory of perceptual defense.** *J. exp. Psychol.*, 1962, 63(1), 23-28.—The role of response factors in producing the perceptual defense effect, was evaluated. 60 college students were assigned to 3 groups: stimulus absent, stimulus present, increasing information. Stimuli, presented tachistoscopically, were pairs of words (half anxiety arousing, half neutral in meaning) selected from S's word association protocol. "The results are interpreted as supporting a response probability theory of perceptual defense. It is suggested that final evaluation of this theory awaits studies in which perceptual recognition scores are obtained under conditions in which no response bias is possible."—*J. Arbib.*

178. Graham, C. H., & Ratoosh, Philburn. (Columbia U.) **Notes on some interrelations of sensory psychology, perception, and behavior.** In Sigmund Koch (Ed.), *Psychology: A study of a science. Vol. 4* (see 37: 93). Pp. 483-514.—5 general topics are considered: (a) "types of stimulus-response

relations in sensory and perceptual experiments," (b) "Descriptive terminology and sensory dimensions," (c) "Relations of sensation and perception," (d) "Formal properties of psychophysical measurement," and (e) "Rational accounts of process in sensory experiments versus scaling." (49 ref.)—E. Y. Beeman.

179. Hirsh, Ira J., & Sherrick, Carl E., Jr. (Central Inst. Deaf, St. Louis, Mo.) **Perceived order in different sense modalities.** *J. exp. Psychol.*, 1961, 62(5), 423-432.—A series of studies was carried out in which it was shown that the amount of time that must intervene between 2 events in order for S to report correctly which of these 2 events preceded the other is approximately 20 msec. This holds over all modalities studied. "Whereas the time between successive stimuli that is necessary for the stimuli to be perceived as successive rather than simultaneous may depend upon the particular sense modality employed, the temporal separation that is required for the judgment of perceived temporal order is much longer and is independent of the sense modality employed."—*J. Arbit.*

180. Ittelson, W. H., & Seidenberg, B. (Brooklyn Coll.) **The perception of faces: A further study of the Engel effect.** *J. Psychol.*, 1962, 53(2), 247-255.—The Engel Effect which involves the stereoscopic presentation of pictures of faces was studied using a factorial design. The following results were obtained: (a) The report of no change following the end of the procedure (Engel Effect) occurred in 62% of the trials in the experimental group. (b) While no change was seen in 39% of the similar pair trials in the control group, there was a significant difference between the experimental groups and the control group in the frequency of reports of no change. (c) There was a highly significant difference in the response to similar as opposed to disparate pairs of photos, indicating that the Engel Effect is dependent, in part, on the relative similarity of the photos involved.—*Author abstract.*

181. Ittelson, William H. (Brooklyn Coll.) **Perception and transactional psychology.** In Sigmund Koch (Ed.), *Psychology: A study of a science*. Vol. 4 (see 37: 93). Pp. 660-704.—The problem of a definition of perception and 3 of the major approaches, phenomenological, S-R, and functional are discussed. The transactional approach is examined more thoroughly. Some research deriving from this approach is summarized, such as studies utilizing aniseikonic lenses, binocular rivalry, rotating trapezoids, and perceived movement. (49 ref.)—E. Y. Beeman.

182. Lacey, O. L. (U. Alabama) **The human organism as a random mechanism.** *J. gen. Psychol.*, 1962, 66, 321-325.—98 Ss were instructed to draw a chord (or set of chords) at random across a circle with an inscribed equilateral triangle. The chords were measured, and the principal result was the finding that the proportion of chords found to be greater than the length of the side of the inscribed equilateral triangle was .628—significantly greater than the upper predicated mathematical limit of .5. Perceptual effects were suggested to account for the finding.—*Author abstract.*

183. McDonald, Roderick P. (U. New England, Australia) **An artifact of the Brunswik ratio.**

Amer. J. Psychol., 1962, 75(1), 152-154.—Brunswik's index of perceptual constancy is shown to be subject to an "algebraic defect" which accounts for some peculiar findings by Hsia (See 18: 988), corroborated by Osgood (see 28: 5135).—R. H. Waters.

184. Meyerson, I. **Remarques sur l'objet.** [Remarks concerning the object.] *J. Psychol. norm. pathol.*, 1961, 58(1), 1-10.—The varieties of agnosias illustrate the complexity of the notion of the perceptual object. The molar object of perception has been defined by Gestalt psychology in terms of the laws of unit formation. Secondary characteristics include subjective factors: e.g., past experience, values, usages of objects. 20th-century atomic physics has all but abolished the physical object. In modern painting the rendition of realistic objects has been superseded by the play of nonobjective forms, colors, etc. There are indications that certain perceptual illusions were perceived differently by the ancient Greeks.—M. L. Simmel.

185. Musatti, Cesare L. (U. Milan, Italy) **Struttura et expérience dans la phénoménologie de la perception.** [Structure and experience in the phenomenology of perception.] *J. Psychol. norm. pathol.*, 1960, 57(2), 125-142.—The author reconsiders the several relationships between objective reality, the structure of the perception, and the nature of perceptual activity.—M. L. Simmel.

186. Phares, E. Jerry. (Kansas State U.) **Perceptual threshold decrements as a function of skill and chance expectancies.** *J. Psychol.*, 1962, 53(2), 399-407.—The hypothesis was tested that when escape from a painful stimulus as a result of S's behavior is possible only on a chance basis, the difference between pre- and postexperiment recognition thresholds for shock-associated stimuli will be smaller than in a skill situation. 3 groups of Ss—14 skill, 14 chance, and 14 nonshock Ss—were used in a modified before-after tachistoscopic threshold design. As predicted, threshold decrements were significantly greater for skill than for chance Ss for both shock and nonshock syllables. There were no significant differences between skill and nonshock groups. Decrement were greater for the non-shock group than the chance group for both classes of syllables.—*Author abstract.*

187. Poulsen, Henrik. **Intellektualistiske erfaringsteorier i amerikansk perceptionspsykologi.** [Intellectualistic empiricism in American perceptual psychology.] *Nord. Psykol.*, 1961, 13(6), 257-272.—The theories of Brunswik, Bruner, and the Ames' group bear a striking resemblance to the classic conception of perception as a quasi-intellectual process dependent on learning (Wundt, Helmholtz). Perception, in this modern version, is fundamentally veridical—veridicality being achieved by learning. The theoretical problems and difficulties of this view are pointed out.—L. Goldberger.

188. Santos, J. F., Farrow, B. J., & Solley, C. M. **Exposure frequency and the perception of a reversible perspective.** *Percept. mot. Skills*, 1962, 14, 199-209.—2 studies are presented that investigate some of the variables related to the perception of ambiguous stimuli. Frequency and duration of exposure to Necker Cubes (balanced, unbalanced to left, and unbalanced to the right) were varied and their influence on the perception of the balanced cube is

reported. Original directional preferences in cube perception are explored.—*W. H. Guertin.*

189. Smedslund, Jan. The utilization of probabilistic cues after 1100 and 4800 stimulus presentations. *Acta psychol., Amsterdam*, 1961, 18(5), 383-386.—The complex stimulus material contained 2 cues with high validity correlations. The majority of Ss showed no relevant learning after a large number of stimulus presentations. A simple "photographic impression" theory is inadequate. There seems to exist a circular relationship between learning and perception, such that learning occurs only in relation to the available perceptual schemata, but can reorganize and modify them.—*G. Rubin-Rabson.*

190. Vekker, L. M., & Lope, YU. P. (Leningrad U.) K probleme postroeniya osyazatel'nogo obraza. [On the problem of the formation of tactual images.] *Vop. Psikhol.*, 1961, No. 5, 143-153.—An investigation of tactual perception and the properties of scanning which lead to adequate perception. A sketch of the procedure and a summary of the results of several experiments on the influence of tactual-stimulus composition on perception are presented. The stimuli were cutout geometric forms. They were presented either by E moving the perimeter of the form over S's passive finger or by S actively exploring the form with one finger. The results suggested that the surface roughness, as well as duration of finger movement on the surface, influence the perception of surface length. Segmenting the scanning procedure by requiring S to explore different segments with different fingers, greatly increased exploration time and reduced accuracy of reproduction.—*H. Pick.*

191. Walk, Richard D., & Gibson, Eleanor J. (George Washington U.) A comparative and analytical study of visual depth perception. *Psychol. Monogr.*, 1961, 75(15, Whole No. 519), 44 p.—This monograph is concerned with discrimination by visual depth perception of depth downward at an edge. A wide variety of species (hooded and albino rats, cats, chickens, lambs, goats, and the human), age variants from very young (less than a day old) to adult, and dark-reared as well as normal light reared animals were all studied with specific reference to their characteristic behavior as evidenced by the avoidance of a cliff. All the animals studied gave some evidence of discriminating depth at an edge, even aquatic animals such as turtles, though in such, this appeared to be a less acute perception than was true of the terrestrials. The results on the whole give evidence of an innate depth perception, influenced in part by environmental factors and the acquisition of learned cues.—*M. A. Seidenfeld.*

192. Zener, Karl, & Gaffron, Mercedes. (Duke U.) Perceptual experience: An analysis of its relations to the external world through internal processings. In Sigmund Koch (Ed.), *Psychology: A study of a science. Vol. 4* (see 37: 93). Pp. 515-618.—The essay concentrates "upon the experimental aspect of perceptual functioning, in the hope of some clarification of its relationships to the external world" and mediating internal processes. Major areas examined include: Phase analysis of perceiving and its implications, "Phenomenal Properties and Perceptual Organizations," and "Anisotropies in Spatial Relationships." (66 ref.)—*E. Y. Beeman.*

Illusions

193. Epstein, William. (U. Kansas) A test of two interpretations of the apparent size effects in a distorted room. *J. exp. Psychol.*, 1962, 63(2), 124-128.—There are 2 explanations for the anomalous apparent size effects observed in a distorted room. The neoempiristic view explains the effects in terms of an interaction of assumptions, apparent distance, and retinal size. The relationalist interpretation refers the effects to the relational properties of the proximal situation. Using college students, the results of the 1st experiment were found to be compatible with both interpretations. The results of a 2nd experiment, however, are consonant only with the neoempiristic viewpoint.—*J. Arbit.*

194. Gardner, R. W., & Long, R. I. (Menninger Found.) Selective attention and the Mueller-Lyer illusion. *Psychol. Rec.*, 1961, 11, 317-320.—The results show a reduction of the Mueller-Lyer illusion with instruction to concentrate on the horizontal line. The finding is significant in that it points out that any adequate interpretation of the illusion must include selectivity of attention.—*R. J. Seidel.*

195. King, William L., & Gruber, Howard E. (U. Colorado) Moon illusion and Emmert's Law. *Science*, 1962, 135(3509), 1125-1126.—The perceived size of an afterimage varies with the part of the sky to which it is projected in a manner predictable from Emmert's law and the appearance of the sky as a flattened dome. This effect is directly analogous to the moon illusion.—*Journal abstract.*

196. Kristof, W. Über die Einordnung geometrisch-optischer Täuschungen in die Gestzmässigkeiten der visuellen Wahrnehmung. Teil I. [A uniform theory of geometric-optical illusions under the rules of visual perception. Part I.] *Arch. ges. Psychol.*, 1961, 113(1), 1-48.—The author tries to develop a uniform theory of geometric-optical illusion and to subsume these phenomena under the rules of ordinary space perception. Based on special experiments, illusions are regarded as effects of size-constancy. The problems of reducing illusion patterns to figural elements and of combining are solved under some restrictions.—*K. J. Hartmen.*

197. Oyama, Tadasu. (Hokkaido U., Japan) The effect of hue and brightness on the size-illusion of concentric circles. *Amer. J. Psychol.*, 1962, 75(1), 45-55.—In a series of experiments it is shown that (a) the illusion is unaffected by the similarity or dissimilarity in hue or brightness of the 2 concentric circles, (b) an increase of the illusion accompanies an increase in the brightness-difference between the outer circle and the background, (c) a decrease in the illusion accompanies an increase in the brightness-difference between the inner circle and the background, and (d) hue has no effect per se—any effect it may seem to have is ascribable to its brightness.—*R. H. Waters.*

198. Taylor, Maurice M. Geometry of a visual illusion. *J. Opt. Soc. Amer.*, 1962, 52(5), 565-569.—A new visual illusion is predicted from the assumption that the perceived distance along any path depends on the discriminability for position along the path. A disk is placed between 2 dots, so that the straight path between the dots is nearly tangent to the disk. It is predicted that, for the perceived

straight path between the dots to be tangent to the disk, the disk must overlay the physically straight path between the dots by an amount proportional to its radius. Furthermore, certain patternings of the disk are predicted to reduce the amount of illusion. All predictions are confirmed in detail. The results are compared with those obtained in an experiment on the filled-space illusion.—*Journal abstract.*

Aftereffects

199. Eysenck, H. J., Willett, R. A., & Slater, Patrick. (U. London, England) Drive, direction of rotation, and massing of practice as determinants of the duration of the after-effects from the rotating spiral. *Amer. J. Psychol.*, 1962, 75(1), 127-133.—4 groups, $N=36$ each, were tested under high or low drive and direction of rotation (expanding or contracting) of spiral, and massed practice. It was predicted that the length of the spiral after-effect would be reduced by increased drive, massing of practice, and by a contracting spiral. All predictions were verified, although the drive variable was not significant at the 5% level.—R. H. Waters.

200. Lipman, R. S., & Spitz, H. H. (Edward R. Johnstone Training & Research Center, Bordentown, N. J.) Cortical conductivity and vocabulary. *J. abnorm. soc. Psychol.*, 1961, 63(2), 459-460.—The relationship of cortical activity to kinesthetic and visual aftereffects was investigated. Cortical activity was measured by Vocabulary test scores. The results do not support a previous finding (Livson & Krech, 1955) of an inverse relationship between these variables.—G. Frank.

201. Wilson, J. (National Physical Lab., Teddington) An apparatus for recording figural after-effects. *Quart. J. exp. Psychol.*, 1962, 14(2), 119-121.—A simple apparatus is described by which figural aftereffects may be recorded directly from the S's adjustments of a test figure. Curves which have been recorded confirm the results, obtained by more laborious methods, of other workers.—*Journal abstract.*

VISION

202. Alpern, Mathew, & Barr, Lloyd. (U. Michigan) Durations of the after-images of brief light flashes and the theory of the Broca and Sulzer phenomenon. *J. Opt. Soc. Amer.*, 1961, 52(2), 219-221.—Measurements were made of the time interval between the primary stimulus and the moment of disappearance of every trace of the after-image for flashes of very intense lights of variable duration. The results can be explained on the assumption that the duration of the afterimage is determined by the time that it takes for the product of a photochemical reaction to fall to some threshold value. Certain predictions from this hypothesis are experimentally verified.—*Journal abstract.*

203. Forrest, Elliott B. (Special Services School, Nassau County, N. Y.) Vision and the visual process. *Education*, 1962, 82, 299-301.—After presenting the distinction between vision and the visual process, analysis of the 2 includes: (a) distinction between the optics of a camera and the optics of the eye, (b) where the visual problem begins, (c) visual ability, (d) the role of stress, and (e) the trainability of vision.—S. M. Amatora.

204. Hebbard, Frederick W. (Ohio State U.) Comparison of subjective and objective measurements of fixation disparity. *J. Opt. Soc. Amer.*, 1962, 52(6), 706-712.—Fixation disparity was measured while the S fixated a target 51.4 cm. away in the median plane. Prism vergence was varied through a range of 20 prism diopters base-in to 20 prism diopters base-out. Subjective measurements were made with a modified haploscope. Photographic, or objective, measurements were made by placing contact lenses with plane mirrors on both eyes of the S and reflecting light to an oscillographic camera, by using the optical-lever principle. The subjective and objective methods gave results which were in close enough agreement to support the conclusion that the mean primary unocular visual direction does not vary as the fusional stress is changed. Photographic records made with steady binocular fixation of the target for over 1 min. showed that the vergence of the eyes varies by less than 10 min. of arc, which is consistent with the concept of Panum's fusional areas.—*Journal abstract.*

205. Jones, Joan E. (Defence Research Medical Lab., Toronto, Canada) Stimulus generalization in two and three dimensions. *Canad. J. Psychol.*, 1962, 16(1), 23-36.—Generalization gradients were obtained for line segments that differed both in length and orientation from the training (standard) stimulus, and for color patches that differed in saturation, hue and brightness. The slope of the 2- and 3-dimensional gradients could be better predicted from the known unidimensional gradients by use of a circular prototype (derived from Hull's excitation hypothesis) than from either Guttman's discrimination hypothesis or a "better criterion" model.—R. S. Davidson.

206. Mackavey, William Raymond. (Michigan State U.) A further investigation of the double flash phenomenon. *Dissert. Abstr.*, 1961, 21(11), 3532.—*Abstract.*

207. Ratliff, Floyd. (Rockefeller Inst.) Some interrelations among physics, physiology, and psychology in the study of vision. In Sigmund Koch (Ed.), *Psychology: A study of a science*. Vol. 4 (see 37: 93). Pp. 417-482.—3 representative problem areas are examined: "(1) the nature of light and its place in the whole spectrum of radiant energy; (2) the manner and mechanism of the transmission and integration of activity in the nervous system; and (3) the behavioral factors involved in the formation of a discrimination." (98 ref.)—E. Y. Beeman.

208. Volkman, Frances C. (Brown U.) Vision during voluntary saccadic eye movements. *J. Opt. Soc. Amer.*, 1962, 52(5), 571-578.—"The present research compared vision during saccades with vision during fixation by means of three representative psychophysical tasks. Each stimulus pattern was presented to the fovea in the form of an instantaneous flash that was delivered before, during, or after an eye movement. The flash lasted only 20 sec. so that retinal blur due to movement was reduced to a negligible amount. The time of the stimulus flash was signaled on a continuously moving film on which the eye movements were recorded by a corneal reflection technique. Detection thresholds for dot patterns and recognition thresholds for words were found to be about 0.5 log unit higher during saccades than during steady fixation. Similar differences, though smaller and less consistent, were found in the min-

imum angles for the resolution of gratings. It is concluded that vision is not 'blanked out' during eye movements, but that it is significantly depressed even under conditions that minimize blur due to movement of the retinal image, and that assure foveal stimulation."—E. Y. Beeman.

Space Perception

209. Atwater, H. A. (Pennsylvania State U.) **Apparent distortion of relativistically moving objects.** *J. Opt. Soc. Amer.*, 1961, 52(2), 184-187.—Objects moving at velocities near the speed of light may appear to have undergone marked distortions of form and aspect when viewed by a stationary O. A procedure for finding these distortions based on the relativistic transformation law for light rays is outlined, and applied to specific examples. It is also found that lines appearing straight at rest may appear curved when in motion at high speed. The role of the finite velocity of light is illustrated by means of a nonrelativistic model.—*Journal abstract.*

210. Borresen, C. Robert, & Lichte, William H. (U. Missouri) **Shape-constancy: Dependence upon stimulus familiarity.** *J. exp. Psychol.*, 1962, 63(1), 91-97.—Using college students, the hypothesis was tested that shape-constancy is a positive function of shape familiarity. Familiarity was defined as the number of times the shapes were presented during a familiarization period. The stimuli were 5 moderately complex shapes systematically constructed from randomly determined coordinates. The results showed that shape-constancy was a positive function of shape familiarity; that shape as a main effect was significant; and that the interaction of shape and frequency (in determining S's matching of a variable shape to the standard stimuli) was significant. Orientation during the familiarization period was not significant. Moreover, the number of orientation positions, within a given range, seemed to be unimportant.—*J. Arbit.*

211. Braunstein, Myron Lee. (U. Michigan) **Rotation of dot patterns as stimuli for the perception of motion in three dimensions: The effects of numerosity and perspective.** *Dissert. Abstr.*, 1961, 21(12), 3860.—*Abstract.*

212. Brown, Donald R., Naylor, James C., & Michels, Kenneth H. (Purdue U.) **Perception of real movement as a function of angle of approach.** *Amer. J. Psychol.*, 1962, 75(1), 144-146.—". . . an attempt to determine the effect of angle of approach on amount of movement necessary to perceive a point-source of light as being in motion. It was found that as angle increased threshold decreased. This result was interpreted as being primarily a function of rate of movement. . . . It is suggested that the relationship between rate of movement and threshold is curvilinear."—R. H. Waters.

213. Burgh, Peter, & Grindley, G. C. (U. Cambridge) **Size of test patch and simultaneous contrast.** *Quart. J. exp. Psychol.*, 1962, 14(2), 89-93.—2 experiments were done to find the effect on simultaneous brightness contrast of placing test patches in, as against outside, the fovea. When the display was magnified so that the test patches were outside the fovea no statistically significant effect was found. Very short exposures, to eliminate eye movements, did not appear to reduce contrast.—*Journal abstract.*

214. Carlson, V. R. (National Inst. Mental Health) **Size-constancy judgments and perceptual compromise.** *J. exp. Psychol.*, 1962, 63(1), 68-73.—"A 'perspective-size' instruction designed to make explicit the response bias postulated to be present in size-constancy judgments of objective-size clearly produced a greater degree of over-estimation than objective-size instruction. The difference from a physically correct size-match was as great as that obtained in the opposite direction when Ss judged in terms of projective-size. Perspective-size was positively correlated with objective-size, negatively correlated with projective-size. It is argued that size-constancy represents the basic functional relationship between object-size and perceived-size, in preference to the view that perceived-size is a compromise between object-size and angular retinal-image size."—*J. Arbit.*

215. Dillon, D. J. **Estimation of bodily dimensions.** *Percept. mot. Skills*, 1962, 14, 219-221.—Estimates of bodily dimensions did not vary systematically with repeated testing. The errors of estimate did not differ among themselves, except when knee height was estimated, in which case there was a large error of overestimation for both ascending and descending estimates. The descending estimates were significantly greater than the ascending estimates for 6 of the 9 dimensions estimated. Except for the knee height estimates, the ascending estimates did not differ from the physical measurements. The descending estimates of the 5 height-dimensions were significantly greater than the physical measurements, those of the horizontal dimension were not.—W. H. Guertin.

216. Dillon, D. J. **Measurement of perceived body size.** *Percept. mot. Skills*, 1962, 14, 191-196.—A device providing for the direct measurement of perceived body size has been developed. 41 Ss (20 nonpatient controls, and 21 psychotic patients) estimated the bodily dimensions of height, width, and depth with the aid of this device. There were no patient-control differences, sex differences, or session differences in the errors of estimate. The descending estimates were greater than the corresponding ascending estimates of all 3 dimensions. The descending estimates were significantly different from the true dimensions of height and depth, while the ascending estimates were not. Overall estimates were significantly different from the measurements of actual height.—W. H. Guertin.

217. Dodwell, P. C. (Queen's U., Kingston, Ontario) **A test of two theories of shape discrimination.** *Quart. J. exp. Psychol.*, 1962, 14(2), 65-70.—An experiment is reported which confirms a prediction from the writer's theory of shape recognition. The same experiment is held to refute an alternative theory; but this refutation is not conclusive, since the alternative theory has not been clearly stated and can be interpreted in several conflicting ways. It is shown that these possible interpretations of the alternative theory all yield predictions which are not confirmed by the present findings.—*Journal abstract.*

218. Gogel, Walter C. (USA Medical Research Lab., Ft. Knox) **The effect of convergence on perceived size and distance.** *J. Psychol.*, 1962, 53(2), 475-489.—The role of absolute convergence in the perception of absolute size and distance was

investigated using convergence values from 0 to 12 degrees. Perceived absolute size was measured by means of a kinesthetic adjustment. With this method, the apparent width of a binocular object of constant angular size was measured at the different convergence values. Perceived absolute distance was measured by providing a visual ruler consisting of a monocularly observed alley containing numbered rectangles. The O judged the apparent position of the binocular object with respect to the alley for the values of convergence previously used with the size judgments. In general, the study supports the conclusion that, even in situations in which no conflicting cues are present, absolute convergence is an imprecise and frequently a negligible determiner of perceived size and distance.—*Author abstract.*

219. Goldstein, Alvin G. (U. Missouri) **Familiarity and apparent complexity of random shapes.** *J. exp. Psychol.*, 1961, 62(6), 594-597.—“Judgments of the complexity of 24 familiar and 26 unfamiliar random shapes of matched physical complexity were obtained from 55 Ss. Familiarization was accomplished with a 10-trial paired-associate learning session 48 hr. prior to the complexity judging session. The familiar shapes were judged to be significantly less complex than the unfamiliar shapes.”—*J. Arbit.*

220. Harcum, E. Rae, & Dyer, Dorothy W. (Coll. William & Mary) **Monocular and binocular reproduction of binary stimuli appearing right and left of fixation.** *Amer. J. Psychol.*, 1962, 75(1), 56-65.—Os were asked to reproduce test patterns made by darkening various ones of a 10-circle template. The fixation-point was between the 5th and 6th circle of the template. Under conditions of both monocular and binocular viewing, accuracy was higher for the left-field patterns. The results are interpreted in terms of a “non-structural and, therefore, presumably learned tendency” favoring left-field elements.—*R. H. Waters.*

221. Highleyman, W. H. **The design and analysis of pattern recognition experiments.** *Bell Sys. tech. J.*, 1962, 41(2), 723-744.—A popular procedure for testing a pattern recognition machine is to present the machine with a set of patterns taken from the real world. The proportion of these patterns which are misrecognized or rejected is taken as the estimate of the error probability or rejection probability for the machine. This testing procedure is discussed for the cases of unknown and known a priori probabilities of occurrence of the pattern classes. The differences between the tests that should be made in the 2 cases are noted, and confidence intervals for the test results are indicated. These concepts are applied to various published pattern recognition results by determining the appropriate confidence interval for each result. The problem of the optimum partitioning of a sample of fixed size between the design and test phases of a pattern recognition machine is discussed. One important nonparametric result is that the proportion of the total sample used for testing the machine should never be less than that proportion used for designing the machine, and in some cases should be a good deal more.—*A. M. Small, Jr.*

222. Hitchcock, L., Jr., Brown, D. R., Michels, K. M., & Spirito, T. **Stimulus complexity and the judgment of relative size.** *Percept. mot. Skills*, 1962, 14, 210.—Arnoult's conclusion that size judgments

may be attributed to differences in area and are relatively independent of differences in other figural characteristics is examined. Findings for 150 straight-line, 2 dimensional shapes suggest that judgment of size is a multivariate response to the stimulus complex rather than a simple correlate of area differences.—*W. H. Guertin.*

223. Hoffman, Elbert Lee. (Princeton U.) **The role of action in defining and changing visual perception.** *Dissert. Abstr.*, 1961, 21(10), 3158-3159.—*Abstract.*

224. Julisz, Bela, & Miller, Joan E. **Automatic stereoscopic presentation of functions of 2 variables.** *Bell Sys. tech. J.*, 1962, 41(2), 663-676.—It has been demonstrated that objects with a randomly dotted surface permit the determination of binocular parallax and, thus, can be seen in depth even though they are devoid of all other depth cues. This random surface presentation has the advantage that the random brightness points can be evenly and densely placed, whereas the classical contour-line projection at equally spaced heights may leave empty spaces between adjacent contour-lines. A digital computer is used to generate the 3-dimensional image of a given $z = f(x, y)$ function and to wrap its surface with points of random brightness. The stereo projections of the function are obtained and, when viewed stereoscopically, give the impression of the 3-dimensional object as being viewed along the z -axis. The random surface prevents the accumulation of clusters of uniform regions or periodic patterns which yield ambiguities when fused.—*A. M. Small, Jr.*

225. Karn, Harry W., Gregg, Lee W., & Pitz, Gordon F. (Carnegie Inst. of Technology) **The effect of systematic and nonsystematic presentation of stimuli on peripheral visual acuity.** *J. Psychol.*, 1962, 53(2), 491-497.—An analysis of responses to Landolt rings presented 5 degrees out from the fovea showed a differential effect of exposure time on peripheral visual acuity as the result of a systematic and nonsystematic presentation of the stimuli. Significantly more errors occur under conditions of nonsystematic presentation when exposure times are .1 and .2 sec.; with exposure times of .5 and 1 sec., these differences disappear. Apparently, prior knowledge of where the stimulus will appear elicits behavior which enables S to improve the accuracy of his perceptual responses.—*Author abstract.*

226. Rambo, William W. (Oklahoma State U.) **Absolute judgment of a restricted distribution of context stimuli.** *J. gen. Psychol.*, 1962, 66(2), 169-178.—Ss were presented with a series of white cards on which appeared groups of black dots. Both the size of the cards and the number of dots were varied over a range of 9 intervals. 3 experimental groups judged the numerosness of dots on a 5-point scale. For one group there was a positive relation between card size and number of dots—large cards had many dots; for a 2nd group the relationship was negative; for a 3rd group, random. A control group judged the size of the cards. After these 162 judgments were made, all Ss were instructed to judge card size on the same 5-point scale and were presented with a series of blank cards of the 5 smallest previous sizes. A 2nd control group judged only the cards of Part II. This group judged Card 5 significantly higher than the other groups, indicating an anchoring influence

of the 1st trials. There were no differences among groups on judgment of dots, but they did differ on the Part II judgments. A mediational process was suggested.—*E. Y. Beeman.*

227. Roelofs, C. Otto. Equidistance tendency. *Acta psychol., Amsterdam*, 1961, 18(5), 368-382.—Gogel's equidistance tendency in the field of depth localization is examined: Is direction of related objects influential? What is the physiological basis of the equidistance phenomenon? Certain phenomena are not in agreement with the latter: in the absence of known distance cues, a monocularly observed object is usually localized slightly nearer than a nearby binocularly observed object; objects localized lower in the visual field are localized slightly nearer than objects situated in the visual field; there is a difference in depth as a result of a more temporal or more nasal, or a more right-sided or more left-sided position in the visual field. The PANUM effect (when 2 vertical lines, placed close together, are presented to 1 eye while only 1 such line is presented to the other eye, the nasal line in front of the 1st eye is localized as nearer) is tested.—*G. Rubin-Rabson.*

228. Triesman, Anne. (Oxford U.) Binocular rivalry and stereoscopic depth perception. *Quart. J. exp. Psychol.*, 1962, 14(1), 23-37.—An investigation was made of stimulus factors causing retinal rivalry or allowing stereoscopic depth perception, given a requisite positional disparity. It is shown that similar color information can be "filtered" out from both eyes, that stereopsis is not incompatible with rivalry and suppression of one aspect of the stimulus, and that the strongest cue for perception of stereoscopic depth is intensity difference at the boundaries of the figures in the same direction at each eye. Identity of color can also act as a cue for stereopsis. The brightness of different monocular figures seen in the stereoscope in different combinations was estimated by a matching technique, and it is suggested that the perceived brightness is a compromise between the monocular brightness difference between figure and ground seen in relation to the binocular fused background, and the mean brightness of the figures. The results are discussed in terms of neurophysiological "on," "off," and continuous response fibers.—*Journal abstract.*

229. Wolfe, Robert. (Eastman Kodak Co., Rochester, N. Y.) Width of the human visual spread function as determined psychometrically. *J. Opt. Soc. Amer.*, 1962, 52(4), 460-469.—The response of the human visual system to an optical image is assumed to be linearly related to the logarithm of the spread function of the photographic system projected onto the retina combined with the spread function of the visual system. From psychophysical data derived from viewing (at different distances) a series of pictures generated with different spread functions, an estimate is obtained of the variance ranges from 3μ to 8μ , depending on the techniques used and on the training of the judges. Although the residual errors in this determination are small, they show systematic trends, indicating that definition depends on other factors than the composite variance.—*Journal abstract.*

230. Zapparoli, G. C., & Ferradini, F. G. (U. Milan, Italy) Les effets perceptifs de la stimulation visuelle a fréquences intermittentes et sub-

fusionnelles. [Perceptual effects of intermittent visual stimuli of subfusion frequencies.] *J. Psychol. norm. pathol.*, 1960, 57, 143-164.—Intermittent light stimuli of subfusion frequencies applied to the same retinal area results in the perception of apparent movement with characteristics different from those previously described (alpha, beta, gamma, phi, W), for which the kinetic organization of rotatory motion appears to be crucial. The conditions which favor one or another kind of apparent movement are analyzed systematically.—*M. L. Simmel.*

Color Vision

231. Balaraman Shakuntala; Graham, C. H., & Hsia, Yun. (Columbia U.) The wavelength discrimination of some color-blind persons. *J. gen. Psychol.*, 1962, 66, 185-201.—An investigation of the wavelength discrimination of 11 Ss classified on the basis of test results as dichromats (4 protanopes and 7 deuteranopes) is reported. The results indicate that the wavelength discrimination of all Ss classified as dichromats is described, for the range of wavelengths between $420 m\mu$ and about $550 m\mu$, by the classical U-shaped curve. The U-shaped curve obtained can be interpreted in terms of trichromatic reduction and fusion theories. The recordable wavelength discrimination thresholds obtained with 2 deuteranopes and 3 protanopes in the long wavelength end of the spectrum may be explained by the hypothesis that such Ss use saturation as a basis for wavelength discrimination. This interpretation is alternative to one that considers the latter Ss to be protanomalous and deuteranomalous trichromats.—*Author abstract.*

Psychol. norm. pathol.*, 1961, 58(3), 257-269.—A discussion of color in physical, physiological, psychological, and philosophical terms. The author reaches "the comforting conclusion that the good sense of naive realism is, with respect to the problem of color perception, more fruitful than philosophical speculations. The perceived object does have the color which the eye lends it (under normal conditions)."—*M. L. Simmel.*

235. Sperling, H. G., & Jolliffe, C. L. (Honeywell Research Center, Hopkins, Minn.) Chromatic response mechanisms in the human fovea as measured by threshold spectral sensitivity. *Science*, 1962, 136(3513), 317-318.—Threshold sensitivity was measured with 40-degree surrounds of 5.3 and 800 trolands of white, and 509, 580, and 690 m μ spectral light. With the brighter white surround there appeared peaks at 550, and 570 and a shoulder at 600 m μ . These were selectively eliminated by the spectral surrounds.—*Journal abstract*.

Visual Sensitivity

236. Chainova, L. D. (Moscow, USSR) Issledovanie sensibilizatsii temnoadaptirovannogo glaza pri dlitel'nom deistvii padporogovykh razdrazhitelei. [Investigations of sensitization of the dark adapted eye under prolonged action of subthreshold stimuli.] *Vop. Psikhol.*, 1961, No. 6, 147-153.—As an index of the change of sensitivity of the eye, E used the change of exposure time required for a light stimulus to be perceived. Thus as a stimulus was repeatedly presented to a partially or a fully dark adapted eye, the time necessary for its perception became less and less. 2 different frequencies of presentation of the light stimulus were used. The higher frequency resulted in less exposure time required for detection. On the basis of this, E argues that the sensitization is not simply an effect of the course of dark adaptation but also involves the effect of stimulation with subthreshold light.—*H. Pick*.

237. Diamond, A. Leonard. (U. Hawaii) Brightness of a field as a function of its area. *J. Opt. Soc. Amer.*, 1962, 52(6), 700-706.—The brightness of a test field as a function of its area was investigated in the fovea at different levels of luminance. A circular test field, which varied in area, was presented to the S's right eye. The S's task was to match the 2 fields in brightness employing the psychophysical method of limits. The dependent variable was the test luminance required either to match a constant match luminance in brightness or to produce a constant threshold effect. The test field radius was varied in 6 steps from 2.69' to 26.86', for any 1 of 6 levels of match-field luminances from threshold to 2.56 logmL. The results showed that only at threshold were there systematic differences in test luminance as a function of test area. Threshold luminance decreased as area increased. At suprathreshold test luminances, differences that did occur were not systematic nor greater than might occur from day to day. A theoretical account is presented based upon possible inhibitory interaction in the retina of "on" by "off" nerve fibers. Curves generated by this theory are fitted to the data.—*Journal abstract*.

238. Ekman, G., & Künnapas, T. (U. Stockholm) Brightness of monochromatic light in scotopic and photopic vision. *J. Psychol.*, 1962, 53(2), 319-327.—The brightness of monochromatic light of 6 wavelengths was measured by the method of magnitude estimation under scotopic and photopic conditions. All the data were adequately described by power functions. The value of the exponent was nearly constant, approximately 0.35, for all wavelengths under both conditions.—*Author abstract*.

239. Erlick, Dwight E. (Wright-Patterson AFB) The ability to filter noise from a visual task when

the noise and signal are presented sequentially. *J. exp. Psychol.*, 1962, 63(2), 111-114.—"Two levels of signal intensity and five signal-to-noise ratios (ranging from 1 to 22) plus a no-noise condition were used. A condition using blank time intervals instead of noise at all signal-to-noise ratios was also used. The task involved the judgment of the relative frequency of two random sequential categories (letters A and B presented visually). Ten different letters randomly interspersed among As and Bs represented the noise. There were no significant differences among any of the foregoing conditions, indicating that Ss effectively filtered out the noise when it was presented in sequential relationship to the signal."—*J. Arbib*.

240. Fehrer, E., & Smith, E. Effect of luminance ratio on masking. *Percept. mot. Skills*, 1962, 14, 243-253.—The masking of a test flash through the simultaneous or delayed stimulation of neighboring retinal areas was investigated over a range of test flash luminances. Test flash luminance determined the shape of the function relating degree of masking of the test flash to delay in the presentation of the masking stimuli. The results are consistent with the assumption that 2 distinct types of masking, simultaneous contrast and metacontrast, influenced the phenomenal characteristics of the test flash.—*W. H. Guertin*.

242. Ikeda, Mitsuo, & Boynton, Robert M. (U. Rochester) Effect of test-flash duration upon the spectral sensitivity of the eye. *J. Opt. Soc. Amer.*, 1962, 52(6), 697-699.—When an increment threshold is measured as a function of the radiance of an adapting field, the so-called threshold-versus-radiance curve is obtained. Stiles has shown by the 2-color threshold technique that this curve is not necessarily smooth but can have inflections whose nature depends upon the conditions. From this he reasoned that the mechanism responsible for the threshold changes from one to another with a change of adapting level, all conditions otherwise being kept constant. In the present paper it is shown that an analogous situation can occur with the threshold-versus-duration curve, which is sometimes called a temporal summation curve. Instead of a change of adapting level, a change in the duration of the test stimulus is considered. An assumption is made that each mechanism has its own threshold-versus-duration curve, and that the overall threshold-versus-duration curve is determined by their relative positions. As an example of the utility of this analysis, 2 sensitivity curves of the eye were obtained with test stimuli of 2 different durations, 100 and 12.5 msec. It is argued that they are different in shape because of a change in the contribution of the responsible mechanisms which can be interpreted in terms of the relative positioning of threshold-versus-duration curves.—*Journal abstract*.

243. Luriya, A. R., Pravdina-Vinarskaya, E. N., & Yarus, A. L. (Moscow) K voprosu o mekhanizmax dvizhenii glaz v protsesse zritel'nogo vospriyatiya i ikh patologii: Simultannaya agnoziya i opticheskaya ataksiya. [On the question of the mechanisms of eye movements in the process of visual

perception and their pathology: Simultaneous agnosia and optical ataxia.] *Vop. Psikhol.*, 1961, No. 5, 159-172.—A patient was referred to the Institute of Neurosurgery with the complaint that he was unable to see more than one object at a time. Clinical tests indicated sluggish and impaired optokinetic and vestibular nystagmus and that the right visual field was partially reduced. EEG recordings indicated absence of alpha rhythm in the visual cortex and unusual response patterns to change of visual stimuli in this area. Careful testing of perception of objects confirmed the patient's original complaint. Objects could only be seen one at a time, and this capacity was independent of the visual angle subtended by the object. Photographs of eye movements made under presentation of various stimuli indicated that the patient could fixate and track a single moving stimulus but could not shift the point of fixation at will. Eye movements which did not occur under presentation of complex stimuli were unrelated to the contours of the stimuli, and the patient lost his initial reference. Injection of caffeine and anticholinesterase preparation succeeded in temporarily reducing the impairments. A more permanent but slight degree of improvement was obtained by a technique of retraining the S to use kinesthetic feedback in place of visual as a basis for coordinating his eye movements.—*H. Pick.*

244. **Matin, Leonard.** (Johns Hopkins U.) **Fourier treatment of some experiments in visual flicker.** *Science*, 1962, 136(3520), 983-985.—This report analyzes some experiments in visual flicker recently described by Forsyth and Brown. The assumption that only the 1st Fourier component of their stimuli is at the flicker threshold, the other components being below threshold, provides a model that accurately predicts their data. Hence, contrary to the conclusions drawn by Forsyth and Brown, no new nonlinear property of the visual system has been demonstrated.—*Journal abstract.*

245. **Severin, S. L.** **Recovery of visual discrimination after high intensity flashes of light.** *USAF SAM Rep.*, 1961, No. 62-16, 11 p.—4 Ss were exposed to light flashes of 0.15-second duration ranging from 645 lux to 56,180 lux as measured at the corneal plane. Each S was tested randomly 5 times at each illumination. Recovery was measured as the period of time required after exposure for S to regain sufficient visual discrimination to perceive testing luminances of 0.06 and 0.013 ft-L. Inter-S variability of recovery time was greater than intra-S variability. Recovery time increased significantly with increasing flash intensity. Response to increasing intensity of the test flashes was significantly different for the 2 testing luminances.—*M. C. Payne, Jr.*

Eye Movements

246. **Battro, Antonio M., & Fraisse, Paul.** **Y a-t-il une relation entre la capacité d'appréhension visuelle et les mouvements des yeux?** [Is there a relation between the capacity for visual apprehension and eye movements?] *Année psychol.*, 1961, 61, 313-324.—When the duration of stimuli is altered, eye movements grow slowly up to a point and then are proportional to the duration. Apprehension increases rapidly, reaching a plateau, at which time (2-3 seconds) the new ocular movements become useless. For longer durations (6-10 seconds) responses increase slightly. The conclusion is that apprehension

is relatively independent of ocular activity.—*G. Rubin-Rabson.*

247. **Collins, William E.** (Federal Aviation Administration, Oklahoma City) **Effects of mental set upon vestibular nystagmus.** *J. exp. Psychol.*, 1962, 63(2), 191-197.—"During rotational stimulation Ss were instructed, in different test sessions, to: (a) do mental arithmetic, (b) make estimates of subjective velocity, (c) reproduce durations of sound stimuli, and (d) assume a state of reverie. The reverie state resulted in significantly less recorded nystagmus than the other three tasks, while mental arithmetic was the most efficacious means of obtaining a vigorous response. A factor of sustained alertness seems to be an important condition for the maintenance of nystagmus."—*J. Arbib.*

Methodological difficulties are pointed out which give rise to error if not appreciated."—*T. E. Newland.*

252. **White, Carroll T., Eason Robert G., & Bartlett, Neil R.** (USN Electronics Lab., San Diego, Calif.) **Latency and duration of eye movements in the horizontal plane.** *J. Opt. Soc. Amer.*, 1961, 52(2), 210-213.—The electrical method of eye movement recording (EOG) was used to study the reactions of the eyes when Ss attempted to fixate as quickly as possible on light stimuli appearing at various points along the horizontal plane. Each eye was recorded separately, allowing an assessment of the degree of independence of the eyes when reacting in this way. In addition to the data concerning latency of ocular reactions and the duration of eye movements

information regarding the relative speed of movement from periphery to center as compared to movements from center to periphery was obtained. It was also found that the 2 eyes tend to act independently in regard to latency and speed of movement when moving toward peripheral stimuli.—*Journal abstract.*

CHEMICAL SENSES

253. Arfmann, Betty Lou, & Chapanis, Natalia Potanin. (Goucher Coll.) The relative sensitivities of taste and smell in smokers and non-smokers. *J. gen. Psychol.*, 1962, 66, 315-320.—6 female undergraduates were instructed to judge varying concentrations of vanilla extract in relation to a constant odor of the same substance on a 7-point rating scale. 3 Ss were nonsmokers and 3 smoked cigarettes regularly. Smokers, as contrasted with nonsmokers, consistently rated the strength of the taste sensation lower. This difference in relative acuity was significant at the .05 level of confidence. The difference in taste acuity decreased noticeably as the strength of the taste concentration decreased, perhaps as a result of the restriction of the range of the rating scale. The "Groups x Concentrations" interaction was significant at the .01 level of confidence. This experiment demonstrates that it is possible to compare reliably the intensities of the sensations from 2 related senses and to quantify these comparisons.—*Author abstract.*

254. Baker, C. H. (Toronto, Canada) Probability of signal detection in a vigilance task. *Science*, 1962, 135(3510), 46.—It is hypothesized that the probability of detecting a signal in a vigilance task depends upon its temporal location with respect to the preceding series of signals. Probability of detection should be at a maximum when the signal occurs after a temporal interval which is equivalent to the mean of the intervals between the preceding signals detected. The experimental results support this hypothesis.—*Journal abstract.*

255. Kamen, Joseph M., Pilgrim, Francis J., Gutman, Norman J., & Kroll, Beverley J. (Quartermaster Food & Container Inst., Chicago, Ill.) Interactions of suprathreshold taste stimuli. *J. exp. Psychol.*, 1961, 62(4), 348-356.—"Twelve experiments were conducted to determine how each unitary taste quality is affected by each of the other taste qualities. Solutions containing stimuli appropriate to both taste qualities were rated for intensity of sweetness, saltiness, sourness, or bitterness by a group of judges. Each experiment was independently replicated. In most cases, the effects were those of simple enhancement or masking, or no effect at all was found. Certain exceptions and complex relationships occurred, and recommendations for follow-up research were made. Various aspects of the method and design were discussed."—*J. Arbit.*

256. Kare, Morley R., & Halpern, Bruce P. (Eds.) The physiological and behavioral aspects of taste. Chicago, Ill.: Univer. Chicago Press, 1961. xvi, 149 p. \$6.00.—Transcripts of the 10 papers (see 37: 144, 154, 257, 586, 607, 622, 629, 718, 725, 728) and their following discussions given at a conference held at Cornell University in June 1960.—E. Y. Beeman.

suprathreshold taste stimuli. In Morley R. Kare & Bruce P. Halpern (Eds.), *The physiological and behavioral aspects of taste* (see 37: 256). Pp. 66-72.—The interactions of the 4 basic taste qualities were investigated using caffeine, sodium chloride, sucrose, and citric acid across a range of intensities. Caffeine had no significant effects upon saltiness or sweetness. It tended to enhance the effects of sourness. Salt had no significant effects on bitterness; its effects on sweetness and sourness were complex. Sugar reduced the intensity of bitterness and sourness but had no general effects on saltiness. Citric acid enhanced the effects of all 3 other tastes, the effect on bitterness being stronger at the lower levels of caffeine.—E. Y. Beeman.

SOMESTHESIS

258. Clark, Brant, & Graybiel, Ashton. Perception of the postural vertical as a function of practice in normal persons and subjects with labyrinthine defects. *USN Sch. Aviat. Med. NASA jt. res. Rep.*, 1961, Proj. MR005.13-6001, Subtask 1, Rep. No. 63; NASA Order No. R-37. 9 p.—The effects of practice on ability to set themselves to the postural vertical were compared in 9 normal Ss and 10 Ss with defective vestibular function. All of the latter had lost the function of the semicircular canals; and 6 did not perceive the oculogravic illusion, a test of otolith function. The normal Ss exhibited smaller average error than those with vestibular defects. It was concluded that pressure cues appear to be adequate to produce good performance, but the non-acoustic labyrinth also contributes to the judgment in normal Ss. The data also support the notion that the tilt chair, as used in this study, is not useful in identifying Ss without otolith function.—*USN SAM.*

259. Crawford, Billy M. (Aerospace Medical Lab.) Measures of remote manipulator feedback: Absolute judgments of weight. *USAF WADD tech. Rep.*, 1961, No. 60-591. ii, 11 p.—Man's ability to estimate weights was determined for 2 lifting conditions: direct manual lifting and remote lifting by means of an Argonne National Laboratory Model 8 Master-Slave Manipulator. The effect of interpolated weight-lifting experience upon absolute judgments of weight was also examined. Results show that: (a) means of estimates made by Ss who lift weights remotely are greater than means of estimates made by Ss who lift the same weights directly; (b) Ss tend to underestimate weights lifted directly; (c) estimates for the remote-lifting condition, even though more accurate on the average, are more variable; and (d) the tendency for Ss to underestimate weights which follow heavier weights and over-estimate those which follow lighter weights is more pronounced for direct lifting than for remote lifting.—*USAF WADD.*

260. Eijkman, E., & Vendrik, J. H. (Roman Catholic U., Nijmegen, Netherlands) Dynamic behavior of the warmth sense organ. *J. exp. Psychol.*, 1961, 62(4), 403-408.—Microwave radiation was used as a warmth stimulus, giving a relatively accurate knowledge of the time course of the temperature in the deeper layers of the skin. The dependence of the threshold of the warmth sense on the time of exposure shows adaptational effects which are in agreement with electrophysiological evidence. The characteristics of the receptors and adaptation (apparently of central origin) are discussed.—*J. Arbit.*

261. Green, Joseph B., Reese, Charles L., Pegues, J. J., & Elliott, Frank A. (Pennsylvania Hosp., Philadelphia) **Ability to distinguish two cutaneous stimuli separated by a brief time interval.** *Neurology*, 1961, 11(11), 1006-1010.—Investigations have reported that perception of 2 simultaneous but spatially separated stimuli is impaired in patients with disease of the central nervous system. This study dealt with the perception of temporally related cutaneous stimuli by a flicker-fusion type of test, employing an electronic stimulator which delivered pulses of varying duration, singly or in pairs. This discriminatory function was impaired in patients with cerebrovascular disease and parietal lobe tumors. Lesions of the spinal cord or peripheral nerve were not associated with deficient identification of paired stimuli.—R. Gunter.

262. Hatwell, Y. **La perception tactile des formes géométriques: Perception et activité perceptive.** [Tactile perception of geometric forms: Perception and perceptive activity.] *J. Psychol. norm. pathol.*, 1960, 57, 165-176.—67 blind Ss (7-17 years old) and 50 seeing Ss (5-9 years old) were tested with 3 types of geometrical forms: (a) simple overlapping figures (triangles, squares, rectangles, etc.), (b) hidden figures (Gottschaldt-Thurstone), and (c) mutilated forms. The simple overlapping figures were recognized by all seeing children, while for the blind, success increased with age. For the Gottschaldt figures, success increased with age for both groups. Comparison of early and late blindness showed no difference for the overlapping simple figures or for the Gottschaldt figures, with 1 exception (the 8-10-year-old group, where the late blinded perform significantly better than the early blinded). The mutilated figures were matched correctly by most of the 5-year-old seeing Ss and by all of the older ones, while matches were random for the blind between 7 and 9 years and then increased in correctness with age. At all ages, figures with mutilated sides were matched more correctly than those with un mutilated angles. The implications of the findings are discussed in detail, especially in reference to Piaget's theories of perceptual development.—M. L. Simmel.

263. Jones, F. Nowell; Twelker, Paul A., & Singer, David. (U. California, Los Angeles) **A waterless thermal stimulator.** *Amer. J. Psychol.*, 1962, 75(1), 147-149.—The device is an adaptation of a unit developed for the cooling of electronic transistors. It possesses a number of advantages over Wagoner's thermulator; it is small, easily portable and mountable, adaptable to S's skin temperature, and available in prefabricated form.—R. H. Waters.

264. McFarland, Joseph H., Werner, Heinz, & Wapner, Seymour. (Clark U.) **The effect of postural factors on the distribution of tactual sensitivity and the organization of tactual-kinaesthetic space.** *J. exp. Psychol.*, 1962, 63(2), 148-154.—The effects of postural tilt upon the distribution of tactual sensitivity as measured by the 2-point threshold of the palms and upon the organization of tactual-kinaesthetic space as measured by the location of the tactual-kinaesthetic straight-ahead have been reported. The findings indicate the necessity of considering postural factors as well as the tactual afferent system in a comprehensive explanation of sensitivity. For both the visual and the tactual modalities there are systematic directional shifts de-

pending on postural factors. This evidence makes it plausible to postulate an inner relationship between these 2 types of shifts—distribution of sensitivity and organization of space.—J. Arbib.

HEARING

265. Bennett, G. S. (Chrysler Corp., Detroit, Mich.) **Remarks on the paper by Montague and Strickland.** *J. Acoust. Soc. Amer.*, 1962, 34, 347.—(See 36: 4BN76M) "It is suggested that the hearing threshold shift found in underwater subjects indicates that the human ear is basically a velocity-sensitive device."—A. M. Small, Jr.

266. Coleman, Paul D. (Johns Hopkins U.) **Failure to localize the source distance of an unfamiliar sound.** *J. Acoust. Soc. Amer.*, 1962, 34, 345-346.—"The ability of Ss to judge the distance of the source of a burst of noise was studied in a free-field situation. Distance judgments by the 20 Ss were, on the first trial, unrelated to actual distance. At the end of 100 trials Ss were localizing the sources with minimum error."—A. M. Small, Jr.

267. Fletcher, John L. (USA Medical Research Lab., Fort Knox, Ky.) **Reflex response of middle ear muscles: Protection of the ear from noise.** *Sound*, 1962, 1(2), 17-23.—The use of the acoustic reflex response (the contraction of the tensor tympani and stapedius muscles) as a protective device is described. The literature on this topic is reviewed pointing out that protection is effective for impulse sounds, but less effective for high level continuous sounds.—A. M. Small, Jr.

268. Guttman, Newman. (Bell Telephone Lab., Murray Hill, N. J.) **A mapping of binaural click lateralizations.** *J. Acoust. Soc. Amer.*, 1962, 34, 87-91.—Movements were mapped of lateralized auditory images associated with 1-pps unfiltered clicks. With sensation level (SL) at 16 db. in both ears, lateralization effects were heard for interaural time differences as large as ± 15 msec. With 16 db. SL in one ear, the minimum level in the other ear producing effects was -6 db., the effect usually being a "bulge" of the image in the audible ear occurring within ± 2 msec. interaural time difference. Approximately the same time-difference limits were found, respectively, for 36 db. in both ears and 36 db. in one ear paired with the minimally effectual -2 db. in the other ear. The time-difference limits within which fusion was "complete" (only one image heard) ranged from 3-7 msec. (louder ear leading) to 3 msec. (louder ear lagging). It is suggested that the results set a bound on the contribution of direct binaural correlation to the precedence-effect phenomenon.—A. M. Small, Jr.

269. Hunt, F. V. (Harvard U.) **Role of time integration in the discrimination of frequency response patterns.** *J. Acoust. Soc. Amer.*, 1962, 34, 125.—The hypothesis is advanced that a time-invariant pattern of frequency response can be discriminated in the presence of a variable pattern of frequency-response irregularity only when the listening interval is of sufficient duration to allow the variable part of the total response pattern to be averaged out. A = B tests were used for the assessment of sound reproducing systems.—A. M. Small, Jr.

270. Kryter, K. D., Weisz, A. Z., & Weiner, F. M. (Bolt Beranek & Newman, Cambridge, Mass.)

Auditory fatigue from audio analgesia. *J. Acoust. Soc. Amer.*, 1962, 34, 383-391.—Intense auditory stimuli (combinations of "noise and music") are being used to some extent in dentistry and medicine for their analgesic effects. Maximum-exposure durations and intensities of noise and music are specified to avoid any undue amount of auditory fatigue. These specifications are based upon previous damage-risk criteria and upon the findings of experiments in which the hearing of Ss was tested before and after exposure to noise and music. The results of these new experiments are compared with the calculations made with formulas developed by others for predicting the auditory fatigue from exposure to noise. The predicted and obtained results are in very close agreement.—A. M. Small, Jr.

271. Kryter, Karl D., & Pearsons, Karl S. (Bolt, Beranek, & Newman, Cambridge, Mass) **Judgment tests of the sound from piston, turbojet, and turbofan aircraft.** *Sound*, 1962, 1(2), 24-31.—Listening tests on tape recorded aircraft noise were conducted in order to determine relative acceptability of the noise produced by various aircraft. Results indicate that a previously proposed metric, PNdb, predicts the data fairly well.—A. M. Small, Jr.

272. Meyer, Max F. **Experiments with air puffs destroy the dogma of the uniqueness of the sinusoidal wave.** *J. Acoust. Soc. Amer.*, 1962, 34, 119-121.—"The minimum number of successive air puffs required to create the sensation of a definite pitch is found to be 2. The fact that air puffs produce in consciousness only that one pitch corresponding to their frequency and not the very high pitches called for by a Fourier analysis demolishes all those 'dynamics of the cochlea' which regard such cochlear mechanics as equivalent to a mathematical development into a Fourier series."—A. M. Small, Jr.

273. Stromsta, Courtney. (Ohio State U.) **Delays associated with certain sidetone pathways.** *J. Acoust. Soc. Amer.*, 1962, 34, 392-396.—"An investigation of the temporal delays associated with internal-sidetone pathways was undertaken. The results showed delay to be a function of frequency for impulsive signals transmitted from the incisors to the mastoid process by bone and from the thyroid cartilage to the mastoid process by tissue. A similar finding was obtained from phonated signals transmitted from the vocal cords to the mastoid process by the sidetone pathways of minimum delay irrespective of media."—A. M. Small, Jr.

274. Ward, W. Dixon. (Research Center, Subcommittee on Noise, Los Angeles) **Studies on the aural reflex: II. Reduction of temporary threshold shift from intermittent noise by reflex activity; implications for damage-risk criteria.** *J. Acoust. Soc. Amer.*, 1962, 34, 234-241.—The temporary threshold shift (TTS) produced by intermittent noise was compared with that produced by steady noise. It was found that an on-fraction of 0.50 resulted in a reduction of 50% in the TTS produced by 1200-2400- and 2400-4800-cps octave bands of noise. However, in the case of 300-600- and 600-1200-cps noise, the same on-fraction reduced the TTS to about one-third the value observed after continuous stimulation. The difference is attributed to the action of the middle ear muscles, which attenuate low-frequency sounds more than high-frequency sounds. Burst duration of 600-1200-cps noise was varied, holding the on-

fraction constant at 0.50; results indicated that the same fractional reduction in TTS is produced by burst durations from 7.5 sec. to 1 min. The inadequacy of the equal-energy rule in assessing the potential danger of intermittent noise exposures is emphasized.—A. M. Small, Jr.

275. Woodhead, Muriel M. (Applied Psycho Research Unit, Cambridge, England) **Value of ear defenders for mental work during intermittent noise.** *J. Acoust. Soc. Amer.*, 1960, 32(6), 682-684.—Ear defenders were worn for protection against the distracting effects of bursts of loud, but not unacceptable, noise during a mental task. 2 types of noise were used: one characterized by high and the other by low frequencies. Performance was better with defenders than without them. The improvement was particularly marked with the high-frequency burst.—A. M. Small, Jr.

Measurement

276. Chocholle, R., & Saulnier, C. **Le seuil différentiel de fréquence: L'effet de la présence simultanée d'un son ou d'un bruit blanc sur l'oreille opposée.** [The difference threshold for frequency: The effect of the simultaneous presence of a sound or of white noise on the opposite ear.] *J. Physiol., Paris*, 1962, 54, 315-316.—The difference threshold for frequency at 10 db. above threshold at 1 Kc., measured by the method of constant stimuli, is significantly increased in all normal human Ss studied, when a tone of 1 Kc. at 40 db. is presented at the same time to the other ear. The same is true for white noise in the opposite ear at 40 db., but the increase is less. There is no significant effect when the frequency in the opposite ear is different from the test frequency.—C. J. Smith.

277. Cox, Jerome R., Jr., & Bilger, Robert C. (Central Inst. Deaf, St. Louis, Mo.) **Suggestion relative to the standardization of loudness-balance data for the telephone TDH-39 earphone.** *J. Acoust. Soc. Amer.*, 1960, 32(6), 773-774.—Loudness balance data obtained by other investigators but previously unpublished, together with loudness balance data gathered by the present authors are presented. It is suggested that a mean of the 3 sets of data be used as a standard in calibrating audiometers supplied with TDH-39 earphones.—A. M. Small, Jr.

278. Cramer, E. M. **Long-term effects of experience on judgments of loudness.** *Percept. mot. Skills*, 1962, 14, 271-280.—An experiment was conducted in which naive Ss were required to make judgments of loudness with a modification of the method of single stimuli. It was concluded that when judged stimuli are remote from an anchor, reliability and intersubject agreement are poor; and that previous experience has only an initial effect on the distribution of judgments, although it greatly affects reliability and intersubject variation.—W. H. Guertin.

• 279. Creelman, C. D. (U. Michigan) **Human discrimination of auditory duration.** *USAF CRC tech. Rep.*, No. 114. vi, 60 p.—The ability of humans to discriminate durations of auditory signals was measured using base time, increment time, and signal intensity as independent variables. 2 sine-wave signals were presented sequentially in a background of continuous white noise, and Ss were required to state for each trial whether the longer signal had occurred

1st or 2nd. The results led to the view that duration discrimination is a statistical decision-making process, and a general model was proposed that permitted accurate prediction over a wide range of experimental conditions. The model is discussed in relation to other theoretical approaches. (63 ref.)—G. H. Mowbray.

280. Creelman, Carleton Douglas. (U. Michigan.) Human discrimination of auditory duration. *Dissert. Abstr.*, 1961, 22(1), 331.—*Abstract*.

281. Elliott, D. N., Riach, W., & Silbiger, H. R. (Wayne State U.) Effects of auditory fatigue upon intensity discrimination. *J. Acoust. Soc. Amer.*, 1962, 34, 212-217.—Changes in the intensity discrimination threshold (IDT) as well as in the threshold of audibility were determined. Significant decreases in the IDT were found to follow fatiguing exposure, such changes being related in a negatively decelerating manner to temporary threshold shift. The extent of the change in the IDT as a function of fatigue was found to be inversely related to the level of the signal. As a result of these 2 relations the range of IDTs as a function of signal strength was markedly decreased for the fatigued ear.—A. M. Small, Jr.

282. Gerall, A. A., & Snyder, C. Non-specific muscular tension and auditory threshold. *Percept. mot. Skills*, 1962, 14, 179-182.—The effect on the auditory threshold of a 1000-cps tone of non-functionally related muscular exertion was tested with 16 Ss who pulled either 0, 100, or 1600 gm. No significant differences in the auditory threshold (as determined by a method of constant stimuli) were found as a consequence of weight pulling. The results support Davis' suggestion that muscular activity having no functional or "geographical" relationship to a sensory process would not influence its threshold.—W. H. Guertin.

283. Harris, Gerald G. (Bell Telephone Lab., Murray Hill, N. J.) Binaural interaction of impulsive stimuli and pure tones. *J. Acoust. Soc. Amer.*, 1960, 32(6), 685-692.—The time-vs.-intensity trade ($\Delta T/\Delta I$) in binaural lateralization was measured for pure tones and impulsive stimuli by the null method for high-pass and low-pass clicks. It was concluded that the time-vs.-intensity trade is important for the localization of high-frequency impulsive stimuli. The interaural intensity difference also affects the ability to lateralize since the error of lateralization is least when both the interaural intensity difference and interaural time difference are zero. From the foregoing and from experiments with 2 lateralized images, it was concluded that the timing information used in binaural lateralization travels along frequency-dependent neural pathways.—A. M. Small, Jr.

284. Jackson, Edward J., Fassett, David W., Riley, Edward C., & Sutton, William L. (Eastman Kodak Co., Rochester, N. Y.) Evaluation of the variability in audiometric procedures. *J. Acoust. Soc. Amer.*, 1962, 34, 218-222.—2 experiments were carried out to evaluate the variability in audiometric procedures. One was designed to evaluate the precision of the audiometric process; the other to determine the repeatability of results in individual Ss taking these examinations. Some differences were found between various instruments

used, and a learning effect was detected on the part of the Ss.—A. M. Small, Jr.

285. Jerger, James. (VA Auditory Research Lab.) Comparative evaluation of some auditory measures. *J. speech hear. Res.*, 1962, 5(1), 3-17.—An extensive battery of both conventional and special auditory tests was administered twice to a group of 27 patients with sensorineural hearing loss, and once to 30 normal listeners. Relative consistency (as defined by the coefficient of reliability, and absolute consistency, as defined by the standard error of the test-retest data) was checked carefully. Also, a comparative evaluation of the extent to which various indices differentiated the sensorineural group from the normal control group was studied. Certain measures, notably the Tone Decay Test (TDT) and the amplitude of the Békésy tracing for a continuous tone, failed to differentiate effectively between normals and sensorineurals.—M. F. Palmer.

286. Loeb, Michel, & Fletcher, John L. Reliability and temporal course of temporary threshold shift and contralateral threshold shift. *USA Med. Res. Lab. Rep.*, 1962, No. 533. 11 p.—In a previous study negligible correlations were found between 2 presumed indices of acoustic reflex action—threshold increase in the ear contralateral to the stimulated ear and temporary threshold shift reduction produced by presentation of an activating tone before each of a series of impulsive stimuli. One possible explanation is that the reliability of each index—or perhaps acoustic reflex activity itself—is sufficiently low that the hypothesized relationship is masked. Reliabilities of temporary threshold shift (TTS) and of contralateral threshold shift (CTS) were therefore measured at varying intervals after initiation or production by click or noise stimuli. CTS reliabilities ranged from low to moderate. TTS reliabilities were higher, especially immediately after exposure. TTS reduction reliability would presumably be lower. While the magnitudes of the reliabilities were such as to explain the lack of relationship of the indices, the use of either index as a diagnostic sign is not precluded.—USA MRL.

287. Melnick, William & Doerfler, Leo G. (U. Pittsburgh) Pure tone audiometry by single threshold crossing. *J. speech hear. Res.*, 1962, 5(1), 18-29.—36 children (18 males and 18 females, ranging in age from 12-3 to 14-7) were used to study an automatic audiometer in methods of single ascent and single descent. 24 children (13 females and 11 males, ranging in age from 12-1 to 14-5) were tested by conventional clinical audiometry. The sole advantage of the automatic audiometer method was the speed of the single trial test. The advantage was not enough to warrant disregard of the other problems which would develop from the use of this technique.—M. F. Palmer.

288. Morin, J. Un test de seuils différentiels auditifs. [A test of differential auditory thresholds.] *Travail hum.*, 1961, 24, 309-327.—Auditory sensitivity to small sound differences was studied by magnetic records of pure sounds: 2 sounds separated by a short interval of silence; these sounds could be increased, made equal, or decreased in intensity (SDI) or in frequency (SDF). The major results: neither had correlation with age or auditory deficiency; SDF had a low correlation with intelligence level and precision tests; both correlated with liking for

music; and both, especially SDI, had a high correlation with the occupational value of a group of 31 silent-room testers.—*R. W. Husband.*

289. **Rubin, Herbert.** (U. Pittsburgh) **Auditory facilitation following stimulation at low intensities.** *J. Acoust. Soc. Amer.*, 1960, 32(6), 670-681.—Shift in threshold was determined by comparing the reference threshold of a test pulse, presented alone, to the threshold for the test pulse preceded by a stimulating pulse. Duration, intensity, and frequency of the stimulating pulse were controlled, as were duration and frequency of the test pulse and duration of the interval between pulses. The nature of the facilitatory process, auditory or attentional, and its locus, whether peripheral or central, are discussed. (25 ref.)—*A. M. Small, Jr.*

290. **Ruhm, Howard B., & Cooper, William A., Jr.** (U. Oklahoma Medical Center) **Low sensation level effects of pure-tone delayed auditory feedback.** *J. speech hear. Res.*, 1962, 5(2), 185-193.—34 males and 46 females, age 18-48, with normal hearing were studied to determine optimal conditions for extrapolation of hearing acuity threshold from pure-tone auditory feedback data. 1000 cps tone-bursts were presented both in synchrony and delayed auditory feedback from finger tapping under 16 combinations of delay duration and sensation level. Ss tapped a simple pattern repeatedly in as constant a fashion as possible. Delayed auditory feedback effects were judged on the basis of differences in tapping rate, pressure, and number error. Effects were present at threshold with 100 msec. delay. The sharpest changes occurred at 200 msec. delay.—*M. F. Palmer.*

291. **Scharf, Bertram.** (Northeastern U.) **Loudness summation and spectrum shape.** *J. Acoust. Soc. Amer.*, 1962, 34, 228-233.—The loudness of 3-tone complexes centered at 2000 cps was studied as a function of the intensity relations among the 3 components. 2 types of spectra were investigated: (a) peaked spectra and (b) sloped spectra. A 3-tone complex whose over-all spacing was greater than a critical band was loudest, at a given SPL, when its spectrum was flat, i.e., when the components were equally intense and, more important, equally loud. Complexes whose over-all spacing was slightly less than a critical band changed little in loudness as a function of spectrum shape. The results are related to the assumption that the loudness of a complex sound is the sum of the loudnesses of the component critical bands.—*A. M. Small, Jr.*

292. **Selters, Weldon, & Ward, W. Dixon.** (Research Center, Subcommittee on Noise, Los Angeles) **Temporary threshold shift with changing duty cycle.** *J. Acoust. Soc. Amer.*, 1962, 34, 122-123.—The empirical rule that interrupted noise having an on-fraction R produces R times the temporary threshold shift (TTS) that the same noise would produce if on continuously was tested for $R \approx 0.5$. The TTS from the 1-min. and 2-min. repetition periods agreed with the value predicted by the rule; but the 4-min., 8-min., and 16-min. repetition periods gave, respectively, 1.07, 1.21, and 1.29 times the R-based values. This result indicates that the on-fraction rule breaks down when on-off times exceed about 1 min., but that the rule may be extended for repeated noises by incorporating a correction factor based on the length of the period.—*A. M. Small, Jr.*

293. **Small, Arnold M., Jr., Brandt, John F., & Cox, Phillip G.** (U. Iowa) **Loudness as a function of signal duration.** *J. Acoust. Soc. Amer.*, 1962, 34, 513-514.—“Ss were asked to change the level of a short noise burst in order to make it equally as loud as a standard 500-msec burst. Above some critical duration loudness is independent of duration but below it for each decade decrease in duration the level of the short burst must be increased about 12.5 db, independent of the level at which the standard burst is presented.”—*A. M. Small, Jr.*

294. **Swets, John A., Green, David M., & Tanner, Wilson P.** (Massachusetts Inst. Technology) **On the width of critical bands.** *J. Acoust. Soc. Amer.*, 1962, 34, 108-113.—“A different technique of analysis is applied to the experiment suggested by Fletcher [see *Rev. mod. Phys.*, 1940, 22, 47-65] for measuring the width of the critical band. This experiment determines the ability of noise bands of different widths to mask a pure tone centered in the band. The analysis considers two filters in series, one outside and one inside the observer. The width of the second filter (the critical band) can be estimated from measurements of the reduction in the noise power at the detector which is effected by the pair of filters. The width of the critical band is estimated under four different assumptions about the shape of the band. The results provide a context for discussing the reasons that may underlie the widely varying estimates of the critical bandwidth which have been obtained in previous studies.”—*A. M. Small, Jr.*

295. **Symons, J. R., & Mackay, C. K.** (U. Aberdeen) **An investigation of changes in auditory sensitivity during the performance of a mental task.** *Quart. J. exp. Psychol.*, 1962, 14(2), 104-108.—Auditory thresholds were measured while the S was relaxed and while he was doing mental arithmetic. Thresholds were lowered under the 2nd condition. Some possible explanations are briefly considered.—*Journal abstract.*

296. **Wolsk, David.** (U. Michigan) **The discrimination limen for loudness under varying rates of intensity change.** *Dissert. Abstr.*, 1961, 21(12), 3866-3867.—Abstract.

Speech Perception

297. **Black, John W., & Hast, Malcolm H.** (Ohio State U.) **Speech reception with altering signal.** *J. speech hear. Res.*, 1962, 5(1), 70-75.—Measures of binaural, 1- and 2-channel reception of spoken words were obtained from 3 groups of university students: (a) 32 native students with normal hearing, (b) 32 native students with slightly defective hearing, and (c) 32 foreign-born students with normal hearing. The 3rd group, which was markedly inferior in identifying English words aurally, was aided somewhat by the preservation of 2 channels throughout the record-listening process. A frequency-divided system, with frequencies below 1600 cps feeding 1 ear and 1600 cps the other, appeared to be slightly penalizing but not importantly so. The tests yielded expected results relative to the signal-to-noise ratio, and consistent results in differentiating among the 3 groups of participants.—*M. F. Palmer.*

298. **Chistovitch, L. A., Klaas, YU. A., Alekin, R. O.** (Inst. Physiology, Akad. Nauk, USSR, Len-

ingrad) O znachenii imitatsii dlya raspoznavaniya zvukovykh posledovatel'nostei. [On the significance of imitation for the discrimination of sound sequences.] *Vop. Psikh.*, 1961, No. 5, 173-182.—A series of experiments was designed to investigate the role of imitation of sounds on the discrimination of sequence of these sounds. The general idea of the experiments was to present a sequence of sounds to a S and ask him to make some identifying or discriminating response to the sequence. The sound elements were varied in their approximation to sounds in the spoken language and in their duration of presentation. The general results indicate that if the response called for is one that names the sound in terms of spoken language (imitation), then discrimination of sequences is more accurate than if the response is a nonimitative one.—*H. Pick.*

299. Farrimond, Thomas. (U. Liverpool) Factors influencing auditory perception of pure tones and speech. *J. speech hear. Res.*, 1962, 5(2), 194-204.—70 male factory employees, aged between 20 and 40 years, and 110 older factory employees, aged between 40 and 79 years, with medically normal ears were studied for group differences in auditory acuity. On the Mill Hill vocabulary test, given without a time limit, at low signal levels listening techniques appear to affect auditory performance. In hearing sentences there appear to be central factors related to the ability to predict or anticipate sentence items of the test. Selection of Ss on the basis of such central factors is suggested as important in the standardization of speech tests or equipment.—*M. F. Palmer.*

300. Schouten, J. F., Cohen, A., & 't Hart, J. (Inst. Perceptie Onderzoek, Eindhoven, Netherlands) Study of time cues in speech perception. *J. Acoust. Soc. Amer.*, 1962, 34, 517-518.—Using only 2 temporal samples of a periodic signal it was possible to synthesize a number of Dutch diphthongs. It is tentatively concluded that "segmentation of speech is possible once the choice of segments is determined by perceptual cues," and that "acceptable speech can be synthesized without any actual frequency transitions or formant bendings."—*A. M. Small, Jr.*

301. Sholtz, P. N., & Bakis, R. (IBM Research Center, Yorktown Heights, N. Y.) Spoken digit recognition using vowel-consonant segmentation. *J. Acoust. Soc. Amer.*, 1962, 34, 1-5.—"A procedure has been developed for recognition of spoken digits by means of digital computer simulation. Using power spectra computed at 10-msec intervals, the words are segmented into vowels and consonants. Vowels are then classified into one of 11 categories by a multivariate statistical decision method operating on approximations of the measurements. Consonants are classified into one of three categories by means of an empirically derived decision tree. Recognition is then performed by means of a dictionary search. When tested on a sample of 493 words spoken by 50 speakers, and with the internal dictionary adjusted for optimum results, 97% of the words were identified correctly. It appears that this procedure is more tolerant of interspeaker variations than those previously reported."—*A. M. Small, Jr.*

PARAPSYCHOLOGY

302. Cox, W. E. (Southern Pines, N. C.) Five-tier placement PK. *J. Parapsychol.*, 1962, 26, 35-

46.—Extending a principle applied earlier in a "3-tier" test of psychokinesis (PK), the E tested Ss for ability to influence steel balls rolling down a long incline. The incline in this experiment provided 5 "choice" points, each with a cul-de-sac for misses and an open alley for hits, which moved on to the next lower tier. The hypothesis under test was that PK acted consistently upon individual balls, either positively or negatively, during each descent so that the elimination of the misses in the upper tiers should give a higher ratio of hits in the lower ones. This hypothesis was not supported, though there were statistically significant results (more hits than misses) in the bottom tier, a finding attributed to motivational factors.—*J. G. Pratt.*

303. Hellstrom, Eva. Veridical precognition of girls dancing. *J. Soc. Psych. Res.*, 1962, 41(711), 252-254.—The writer had an apparition on the afternoon of November 12, 1961 while asleep, in which she saw teenagers dancing in brightly colored dresses of turquoise blue and cerise. She made a record of this in her diary. On November 24 she and her husband went to London and attended a play which her husband chose, *Bye Bye Birdie*, in which the same teenage scene with gayly-colored dresses of blue and cerise occurred in Act I. On returning home she showed her diary entry to a companion and her husband.—*O. I. Jacobsen.*

304. Pronko, N. H. (U. Wichita) A Classroom demonstration of "extra sensory perception." *Psychol. Rec.*, 1961, 11, 423-425.—What appears to be extrasensory perception is attained "through inapparent, plain 'sensory perception.'" The technique consists of using existing conditions of illumination to decipher the symbol on the back of ESP cards.—*R. J. Seidel.*

305. Rhine, J. B., & Feather, S. B. (Duke U.) The study of cases of "psi-trailing" in animals. *J. Parapsychol.*, 1962, 26, 1-22.—From the wide range of observations of unexplained animal behavior which suggest an ESP basis, this article selects for special consideration those cases in which pet animals followed their owners over large distances to places where the animals had never been before. From a background of 54 such cases now on hand, the writers find several that measure up well on specific criteria applied as aids to judgment. This study is not aimed at reaching scientific conclusions but at emphasizing the need and possibilities for experimental investigations.—*J. G. Pratt.*

306. Ryšl, Milan. Training the psi faculty by hypnosis. *J. Soc. Psych. Res.*, 1962, 41(711), 234-252.—The problem of psychological and sociological integration of ESP into daily life. One S was trained during hypnosis to transfer the ESP ability from the hypnotic state to normal application in waking life. After the training the S was taught to bring herself into hypnosis independent of the E. In 1 year of training she was able (a) to apply ESP ability in all cases where suitable inner psychological conditions prevailed, i.e., ESP ability was far above chance (one being 21 hits on 23 trials), and (b) to use her clairvoyant powers for solutions.—*O. I. Jacobsen.*

307. Sanders, M. S. (31 Woodbourne Ave., Leeds, England) A comparison of verbal and written responses in a precognition experiment.

J. Parapsychol., 1962, 26, 23-34.—This paper deals with ESP research carried out with 20 women college students as Ss, selected on the basis of their interest. Some preliminary pilot tests were directed toward the cultivation of favorable S-E relations and the development of a suitable experimental design. The confirmatory series, carried out with a 2-E level of safeguarding, involved testing the Ss ability to precognize random orders of ESP symbols to be selected immediately afterward. 2 methods of calling, writing and speaking, were used; and the statistical test for significance, as designated in advance, was based upon the difference between the results by the 2 methods for each S and a chi-square summation over all Ss. Statistically significant results were obtained.—J. G. Pratt.

308. Shewmaker, Kenneth L., & Berenda, Carlton W. (Oklahoma City VA Hosp.) **Science and the problem of psi.** *Phil. Sci.*, 1962, 29(2), 195-203.—Some issues and points of view concerning the acceptance or rejection of parapsychological phenomena are reviewed. Psi may be the product of the fact that scientific concepts derive from abstractive and classificatory thinking. By describing psi in a nondiscursive symbolism one may know, if not explain, the phenomenon in a manner analogous to his knowing the clinically unique case of the individual.—M. Turner.

ENVIRONMENTAL EFFECTS

309. Barnard, George W., Wolff, Harold D., & Graveline, Duane E. (Aerospace Medical Lab., Wright-Patterson AFB, O.) **Sensory deprivation under null-gravity conditions.** *Amer. J. Psychiat.*, 1962, 118(10), 921-925.—Using a water immersion method in order to minimize sensory input, and to achieve a near weightless state, 14 Air Force pilots served as Ss. Intellectual and emotional changes were observed although not as marked as in previous studies, the reasons for which are discussed.—N. H. Pronko.

310. Freedman, Danford J., Grunebaum, Henry U., Stare, Frederick A., & Greenblatt, Milton. (Brandeis U.) **Imagery in sensory deprivation.** In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 108-117.—Experimental Ss wore translucent or black-out goggles while lying on a bed in a small room with extraneous stimulation minimized, and reported their thoughts and perceptions during an 8-hour session. . . . the production of imagery in sensory deprivation seems to be related to a homogenous visual field regardless of the field's intensity. . . . Sensory deprivation imagery closely resembles hypnagogic (and hypnopomic) imagery. . . . Subjects are more likely to report imagery during sensory deprivation if they have a history of hypnagogic imagery than if they have not.—J. B. Thompson.

311. Fryer, D. I. (RAF Inst. Aviation Medicine, Farnborough, England) **Physiologic effects of exposure to ram pressure.** *Aerosp. Med.*, 1962, 33(1), 34-41.—A new technique to simulate ejection ram pressure is reported. A large centrifuge in water, in which the S's head was 3 feet below the surface, was used. The S was clothed in a rubber suit with diving mask. The device propelled the seat up to 32.6 feet per second, equivalent to 20 knots

water speed or 515 knots indicated air speed (IAS). Breath-holding was maintained safely even when the rise of pressure in the thorax was as much as 5.25 pounds per square inch (psi). Ram pressure of 4.9 psi was tolerated without trouble, but at higher speeds there were severe signs and symptoms. Values of forces acting upon the arms and legs up to the equivalent of 460 and 515 IAS were tabulated. For extended study it was suggested that a catapult track under water may be of value.—J. C. G. Loring.

312. Hull, J., & Zubek, J. P. **Personality characteristics of successful and unsuccessful sensory isolation subjects.** *Percept. mot. Skills*, 1962, 14, 231-240.—46 Ss were isolated in a plexiglass, domeshaped chamber under one of 2 conditions; constant darkness and silence, or unpatterned light and noise. The MMPI, Edwards' Personal Preference Schedule, the Thurstone Temperament Schedule, and a biographical questionnaire were administered. No reliable differences on any of the 40 variables measured by the personality tests could be observed between the successful and unsuccessful groups. On the biographical questionnaire, 2 of the 20 items reliably differentiated the 2 groups of Ss (combined conditions).—W. H. Guertin.

313. Miller, S. C. **Ego-autonomy in sensory deprivation, isolation, and stress.** *Int. J. Psycho-Anal.*, 1962, 43(1), 1-20.—This study attempts to cull the common elements that exist in both experimental and actual experiences of prolonged sensory deprivation and social isolation. After discussing these findings in terms of the differing theories of Rappaport and of Gill and Brennan, the author gives a rapprochement of their views.—G. Elias.

314. Mitchell, Mildred B. (Wright-Patterson AFB, O.) **Time disorientation and estimation in isolation.** *USAF ASD tech. Rep.*, 1962, No. 62-277, 13 p.—Tests were conducted to determine data on time estimations in isolation. 34 Air Force Ss, including 10 test pilots, were isolated individually. They estimated 5 seconds accurately; overestimated 1 second; tended to underestimate 10 seconds; and significantly underestimated 6, 30, 60, and 120 minutes. 12 Ss became confused or slept without knowing it, and gave incorrect number or rhythm of estimations. Even with a clock and lights, 5 of 10 Ss became confused. Ss put in dark isolation for 48 hours tended to estimate 4-hour intervals as progressively shorter. 2 aborted the experiment, 1 after hallucinating.—USAF ESD.

315. Ormiston, Donald W. (Aerospace Medical Lab.) **A methodological study of confinement.** *USAF WADD tech. Rep.*, 1961, No. 61-258, 23 p.—34 Ss divided into 2 groups were confined for 8 hours in a lighted 5 by 8 ft. cubicle where they worked occasionally on tracking, monitoring, and time estimation tasks and noted somatic complaints. Visual illusions were administered before and after confinement. 20 Ss in another group underwent all of the tests but were not confined. A battery of personality tests was given to the Ss 1-3 months before they participated. Correlations among the personality test scores, the changes in the visual illusions, and the performance tasks were computed. The results of the performance tasks showed no significant differences between the confined and non-confined groups. Time estimates did not vary significantly during confinement. Confirmatory evidence

was gained favoring the use of the spiral aftereffect and rejecting the latency of autokinesis as criterion measures of confinement stress.—E. Y. Beeman.

316. Pearson, Richard G. (Flight Safety Found., Phoenix, Ariz.) **Relationship between tie-down effectiveness and injuries sustained in lightplane accidents: 1942-1952.** *Aerosp. Med.*, 1962, 33(1), 50-59.—A statistical analysis of crash injury data on 1025 occupants involved in light plane accidents is reported. Data are for spin-stall crashes, or for collisions with the ground or objects (excepting other aircraft) while in flight. Tables and graphs are presented from which these conclusions are made: the head and upper torso should be protected by the use of a crash helmet and shoulder harness; seat belts are not enough. Energy absorbing principles should be used in the design of seats in order to reduce lumbar spine fractures in low-angle long-deceleration crashes. Although belt failure occurs more frequently than seat failure, injury severity is greater when seats fail than when belts fail. And finally, "high rates of onset of g associated with secondary pulses in long decelerations are felt to be a significant source of injuries, particularly when tie-down fails."—J. C. G. Loring.

317. Robertson, M. H. (U. Florida) **Sensory deprivation and some therapeutic considerations.** *Psychol. Rec.*, 1961, 11, 343-347.—A summarization first of the theoretical position that a person's response to sensory deprivation (SD) is describable in terms of preoccupation and suggestibility and that abnormal behavior is a deprivation phenomenon. The major therapeutic implication is to reinstate the normal level and range of external and internal stimulations by either increasing the total amount of stimulation or increasing certain classes of stimulation or introducing variety to eliminate monotony and satiation effects. Preventive therapy is possible by limited, graded SD experiences leading to tolerance or immunity against effects of prolonged deprivation.—R. J. Seidel.

318. Shurley, Jay T. (U. Oklahoma) **Mental imagery in profound experimental sensory deprivation.** In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 153-157.—11 Ss were requested to remain in a water tank as long as possible, in conditions minimizing sensory input. No S remained longer than 6 hours, and all Ss experienced some form of mental imagery. The phenomena reported ranged from day dreams to "fully projected hallucinatory experiences."—J. B. Thompson.

319. Silverman, A. J., Cohen, S. I., Bressler, B., & Shmavonian, B. M. (Duke U.) **Hallucinations in sensory deprivation.** In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 125-134.—Paid Ss, given no clues as to the nature or duration of the study, were placed in a darkened acoustical chamber for a period of 2 hours. Ss were then given a questionnaire and interviewed 3 times. Visual, auditory, and kinesthetic sensations are described. The relationships between hallucinations, illusions, and ego function are discussed. (18 ref.)—J. B. Thompson.

320. Solomon, Philip, & Mendelson, Jack. (Harvard Medical School) **Hallucinations in sensory deprivation.** In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 135-145.—7 of 28 Ss developed visual hallucinations in response to sensory deprivation

in a tank type respirator. 3 of these 7 also had somesthetic hallucinations. Ss who experienced hallucinations had a smaller increase in noradrenalin excretion and in urine volume output, and experienced fewer day dreams, more illusions and pseudosomatic delusions than did the nonhallucinating group. The data are discussed in terms of current concepts of hallucinations and the criteria or their definition.—J. B. Thompson.

321. Vernon, Jack A., & McGill, Thomas E. (Princeton U.) **Sensory deprivation and hallucinations.** In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 146-152.—20 Ss were subjected to 1 of 2 degrees of severity of sensory deprivation for 24, 48, or 72 hours. Results indicate that as the conditions of sensory deprivation become more severe the number of hallucinations decreases. A comparison is made between hallucinations occurring during confinement and those evoked by cortical stimulation.—J. B. Thompson.

SLEEP & FATIGUE

322. Olsen, Leif Ole. (New York U.) **The relationship between fatigue and the organization of the individual: An experimental analysis of the relationship between fatigue and the organization of the individual, and the effect and relationship of certain other variables to fatigue and organization.** *Dissert. Abstr.*, 1961, 21(10), 3159-3160.—Abstract.

323. Oswald, Ian. **Sleeping and waking: Physiology and psychology.** New York: American Elsevier, 1962. ix, 232 p. \$7.50.—A comprehensive review of the physiology and psychology of sleep. Chapter titles include: "The Physiological Basis of Sleep," "Sleep and Consciousness," "The EEG of Sleep," "Attention and Imagery," "Dreams," "Deprivation of Sleep," and "Sleep Mechanisms and Some Clinical Conditions." Sensory discrimination, memory and movements during sleep, hypnosis, physiological changes during sleep, and the relation of light sleep to psychoses are also discussed. (400 ref.)—J. B. Thompson.

324. Shurley, Jay T. (U. Oklahoma) **Hallucinations in sensory deprivation and sleep deprivation.** In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 87-91.—Remarks introductory to paper discussion. (36 ref.)—J. B. Thompson.

325. Williams, Harold L., Morris, Gary O., & Lubin, Ardie. (Walter Reed Army Inst. Research, Washington, D. C.) **Illusions, hallucinations and sleep loss.** In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 158-165.—In 2 studies 36 Ss were deprived of sleep for 72 or 98 hours. Results indicate that visual misperception, temporal disorientation, and cognitive disorganization increased as sleep loss progressed. It is suggested that hallucinations depend on the ratio of specific afferent activity to subcortical activity and that when this ratio is low, the perceptual integrating system is controlled by the subcortical input.—J. B. Thompson.

MOTIVATION & EMOTION

326. Dass, S. L., & Rao, M. S. Prakash. (Defence Science Lab., Delhi, India) **A study on the psychological effects of experimental isolation and**

semi-starvation. *Def. sci. J., Delhi*, 1961, 11(2), 104-111.—A batch of Navy personnel was kept in isolation under conditions of semistarvation for a period of 5 days. It was observed that during this period there was no significant deterioration in the capacity of the Ss for mental effort. Feelings of tiredness and exhaustion which were reported by the Ss also appeared to be more an outcome of idleness and unwillingness to continue with the situation than the result of any serious physical weakness.—*Journal abstract*.

PSYCHOMOTOR TASKS

328. Abelson, Robert Paul. (Princeton U.) Spectral analysis and the study of individual differences in the performance of routine, repetitive tasks. *Dissert. Abstr.*, 1961, 21(10), 3155-3156.—*Abstract*.

329. Adams, Jack A., & Chambers, Ridgely W. (U. Illinois) Response to simultaneous stimulation of two sense modalities. *J. exp. Psychol.*, 1962, 63(2), 198-206.—“A bisensory discrete tracking task was used where a probabilistic series of simultaneous auditory and visual stimuli were presented, each stimulus series for response with a separate hand. An auditory and a visual control group each practiced only a unisensory version of the task where response was with one hand. . . . The results revealed a net superiority of bisensory over unisensory responding when stimulus events were certain. This was because S in the bisensory task usually made the two response movements together, and anticipation of certain events resulted in an increase in speed of the visual response time to that of the faster audio response time. But, when events were uncertain, impairment was inferred for bisensory responding because the faster audio response time was reduced in speed and synchronized with the slower visual response time.”—*J. Arbit.*

330. Adams, Jack A., & Creamer, Lyle R. (U. Illinois) Anticipatory timing of continuous and discrete responses. *J. exp. Psychol.*, 1962, 63(1), 84-90.—Tested “the hypothesis that anticipation of directional signal change in one-dimensional continuous tracking, and time of even change in discrete tracking, is some function of mediated responses and their response-produced cues. A transfer of training design was used where practice on the criterion tracking task was preceded by a pretraining session where neutral responses were made to time regularities in the task stimuli. . . . Significant amounts of transfer of training were found and mediation as a mechanism for anticipation in tracking was found tenable. No differences were found for the motor vs. nonmotor locus of the mediators. Time-varying proprioceptive traces and cognitive learning were discussed as explanations.”—*J. Arbit.*

[The influence of temporal uncertainty on choice time-reaction situations.] *Année psychol.*, 1961, 61, 361-376.—In simple reaction time, length and variability of the preceding period are

influential. In choice reaction-time situations, time uncertainty affects reaction time.—*G. Rubin-Robson*.

332. Brebner, John, & Gordon, Ian. (U. Exeter) Ensemble size and selective response times with a constant signal rate. *Quart. J. exp. Psychol.*, 1962, 14(2), 113-116.—Using a selective response task in which Ss were required to respond only to 1 of a number of alternative digits, although signal rate was held constant, the latency of selective responses was found to lengthen as the number of alternatives increased. This finding does not support the inference drawn from the work of Mowbray (1960) that, with signal rate held constant, there should be no significant lengthening of reaction times as the ensemble of digits increases.—*Journal abstract*.

333. Fehrer, Elizabeth, & Raab, David. (Brooklyn Coll.) Reaction time to stimuli masked by metacontrast. *J. exp. Psychol.*, 1962, 63(2), 143-147.—“This study was designed to determine whether metacontrast suppression of a light flash affects RT [reaction time] to the flash. Masking of a square target was achieved by subsequent flashing of two adjacent squares. Stimulus onset asynchronies were studied over a range from 0 to 75 msec. Phenomenal suppression of the first flash varied from none (0 asynchrony) to maximum (75 msec. asynchrony). With both foveal and peripheral vision, the results showed no effect of phenomenal brightness on RT. RT to the target, flashed alone, was never faster than RT to the target followed by masks. It was therefore the physical dimensions of the stimulus rather than its phenomenal characteristics that determined RT.”—*J. Arbit.*

334. Foley, P. J., & Humphries, M. (Defence Research Medical Lab., Toronto, Canada) Blocking in serial simple reaction tasks. *Canad. J. Psychol.*, 1962, 16(2), 128-137.—A series of visual or auditory stimuli were presented at different intervals and reaction times were recorded. Occasional blocks (latencies 3.29 times greater than the SD) occurred for all Ss. There was no evidence of a correlation between blocking and fatigue, nor was periodicity revealed. Too little is known about the conditions which generate blocks to warrant the formulation of a theory.—*R. S. Davidson*.

335. Jones, F. P., & Hanson, J. A. Note on the persistence of pattern in a gross body movement. *Percept. mot. Skills*, 1962, 14, 230.—Movement of the head when a S quickly moves from sitting to standing was recorded by multiple-image photographs. 15-months retest of one S reveals that “the basic character of the movement pattern has persisted.”—*W. H. Guertin*.

336. Lipman, Ronald S., & Spitz, Herman H. (Edward R. Johnstone Training & Research Center) The relationship between kinesthetic satiation and inhibition in rotary pursuit performance. *J. exp. Psychol.*, 1961, 62(5), 468-475.—Using college students and retarded adolescents, the proposed similarity between cortical satiation and inhibition was tested by having high and low kinesthetic satiators track on the pursuit rotor under varied conditions of work and rest. The “results were interpreted as indicating that the high satiator brings a somewhat stronger learned tendency to rest (s_{1R}) to the work task and that, in addition, the high satiator converts I_R to s_{1R} whereas the low satiator, even after prolonged periods of con-

tinuous work, does not convert I_R into S_{I_R} ."—*J. Arbit.*

337. Pinneo, Lawrence R. (McGill U.) **The effects of induced muscle tension during tracking on level of activation and on performance.** *J. exp. Psychol.*, 1961, 62(5), 523-531.—38 male college students were trained in an auditory tracking task. Physiological measures were obtained during training and while squeezing a hand dynamometer to a predetermined level of muscle tension during tracking. "Results clearly showed close agreement between amount of tension induced and the level of activity in all physiological measures. These results were considered in support of a theory that the proprioceptive return from the induced muscle tension produces generalized behavioral and physiological effects indirectly by increasing activity in the reticular activating system." (15 ref.)—*J. Arbit.*

338. Ryan, E. Dean. (U. California, Berkeley) **Effects of stress on motor performance and learning.** *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 33(1), 111-119.—Male college students were tested on a motor learning task that involved balancing for 12 trials on the pivoted platform of a stabilometer. The task was made easy for 40 of the Ss by placing the platform 10 in. below the pivot and made difficult for 80 of the Ss by placing it 10 in. above the pivot. $\frac{1}{2}$ of the easy-task Ss were given electric shocks irregularly during the learning period to produce tension. Their performance or learning did not differ appreciably from the control Ss. Under the same conditions, except that the difficult task was used, the experimental Ss achieved the same amount of learning as the controls but showed poorer performance throughout the test. When the application of the tension-producing shock was delayed until the 3rd trial, it produced a lesser amount of performance impairment for that trial but full impairment for later trials. The results support the hypothesis (based on earlier studies) that increased tension impairs performance of a difficult motor task and that rate of learning is independent of the state of tension for either difficult or easy skills—except that predicted better performance under tension for the easy task did not occur.—*Journal abstract.*

339. Zhukov, E. K., & Zakhar'yants YU. Z. (Inst. Physical Culture, Leningrad, USSR) **K voprosu o fiziologicheskikh mekhanizmax vol'nykh deistviy.** [On the question of physiological mechanisms of volitional actions.] *Vop. Psikhol.*, 1961, No. 6, 127-135.—Ukhtomskii's mechanism of the dominant is applied to volitional activity. The concept of dominant involves the idea that excitation of the central nervous system can exert a structuring and organizing role on all nervous activity. It is predicted that (a) volitional activity may be reinforced by different stimuli, (b) goal directed behavior will be accompanied by a decrement in other tasks, and (c) volitional set can be disrupted by over extension of the factors causing it or by another concurrent set. Using a weight supporting task, these predictions are put to test. It is found that verbal encouragement will improve performance, the weight holding task causes a decrement in a simultaneous dynamometer task, and increasing the weight or giving the S a 2nd demanding task can disrupt the original task. The effect on EMG recordings of these various factors are also described.—*H. Pick.*

ATTENTION & SET

340. Baker, C. H. (Defense Research Medical Lab., Toronto, Canada) **On temporal extrapolation.** *Canad. J. Psychol.*, 1962, 16(1), 37-41.—In a vigilance task, series of visual stimuli which differed in mean inter-signal intervals and in interval variability were presented so that no signals escaped detection. After each series S was asked to produce 2 successive signals at the times he would expect them. Consistent with the expectancy theory of vigilance, Ss were able to extrapolate to the mean of the preceding series with some precision regardless of the variability of signal input.—*R. S. Davidson.*

341. Berlyne, D. E. (Boston U.) **Conflict and the orientation reaction.** *J. exp. Psychol.*, 1961, 62(5), 476-483.—3 experiments were carried out in order to study the effect of collative stimulus properties (novelty, surprisingness, complexity) on the amplitude of the orientation reaction and to test the hypothesis that conflict underlies the motivational effects of collative variables. The GSR was used as an index of the orientation reaction. In Experiment I, GSR amplitude increased with degree of conflict, unconfounded with novelty, surprisingness, intensity, and distance from fixation point, of stimuli. In Experiment II, GSR amplitude increased with response uncertainty. And in Experiment III, stimuli that were surprising without being novel (surprise being interpreted as a form of conflict) likewise produced increased GSRs. (17 ref.)—*J. Arbit.*

342. Foster, Harriet. (U. Michigan) **The operation of set in a visual search task.** *J. exp. Psychol.*, 1962, 63(1), 74-83.—Studied the effects of varying sets on the location and identification of words in a field of unrelated words. Sets were defined in terms of either functional or structural categories with varying degrees of specificity. The interpretation of the results was in terms of a "gating" mechanism where the gates for functional categories are the category members and the gates for structural categories are the defining attributes of the category. (23 ref.)—*J. Arbit.*

344. Natadze, R. G. **Ustanovochnoe deistvie voobrazheniya.** [The effect of imagination on set.] Tbilisi, USSR: Gruzinskoi SSR Academy Sciences, 1958. 207 p.—The author presents the results of 7 studies on the effect of imagination on set. These studies were previously published during the period 1942-55. The language of the book is Georgian with a 4-page summary in Russian.—*I. D. London.*

345. Thrane, V. C. **Sensory and preparatory factors in response latency: V. Stimulus blanks as regulator of preparatory set.** *Scand. J. Psychol.*, 1962, 3(1), 1-15.—When otherwise nearly replicating the preceding experiment (see 36: 4BN11T), but excluding the final reaction signal in 14% of the trials under all conditions, response latency was much less affected, if at all, by differential warning of stimulus strength. It is concluded that a constant proportion of stimulus blanks serves largely to equalize perceptual uncertainty on the part of the respondent as to presence of a stimulus in spite of variations in the sensory adequacy of the expected stimulus, and hence

may be used when necessary as an antecedent variable for generating more comparable preparatory sets in studies concerned with the sensory effects of stimulus variables.—*Journal abstract.*

LEARNING

346. Broadbent, D. E., & Gregory, Margaret. (Medical Research Council, Cambridge, England) *Human response to classes of stimuli.* *Nature, Lond.*, 1962, 193, 1314-1315.—Observation of a S sorting a pack of cards is the basis for a study of the correlation between practice and stimuli and the effect on response. The conclusion is that practice is important.—*M. C. Benton.*

347. Burroughs, G. E. R., & Morris, J. N. (U. Birmingham) *Factors involved in learning a simple musical theme.* *Brit. J. educ. Psychol.*, 1962, 32(1), 18-28.—100 pupils, both sexes, age 13 plus, completed a battery of reference tests of musical ability. They also had repeated trials at singing a musical theme after hearing it on the piano. 4 pertinent factors were identified: (a) memory for melody, (b) recognition of musical shape, (c) verbal intelligence and interest, and (d) rhythmic accent. It was noted that errors persisted—suggesting that pupils remember what they thought they heard. Learning "curves did not follow the overall learning curve, although they behaved in a generally regular manner." (17 ref.)—*B. T. Jensen.*

348. Chatterjee, N. R. *Development of new tachistoscope-cum-memory apparatus.* *MANAS, Delhi*, 1960, 7, 41-43.—The apparatus (consisting of a body with rotating aluminum disc, electromagnetic control, and time controlling clock mechanism) has definite advantages over the traditional one.—*U. Pareek.*

349. Clark, R. Ernest. (State U. Iowa) *The role of drive (time stress) in complex learning: An emphasis on prelearning phenomena.* *J. exp. Psychol.*, 1962, 63(1), 57-61.—"The role of 'time stress' (drive) in complex learning and performance was investigated by relating empirical changes in prelearning competing response hierarchies to differences in the early learning performance of high and low time-stress groups. The relative strengths of competing responses were provided before learning by relative frequencies of occurrence of spatial responses to a single stimulus in a motor paired-associate task. The response consisted of dividing a slot with a stylus so that the divisions corresponded with those presented in a stimulus line. . . . It was found that the effects of time stress (drive) upon prelearning competing response hierarchies were largely compatible with Hullian drive theory. Predictions of early learning performance, based on these known prelearning effects, were supported by the learning data."—*J. Arbit.*

350. Conrad, R. (Medical Research Council, Cambridge, England) *Practice, familiarity and reading rate for words and nonsense syllables.* *Quart. J. exp. Psychol.*, 1962, 14(2), 71-76.—2 experiments were carried out to test a number of hypotheses regarding the effects of practice and SR familiarity on choice reaction times. In Experiment I, Ss read lists of nonsense syllables of varying levels of association value and differing degrees of choice. It was found that the slope of reading time per syllable was linear

with respect to the log of the number of choices, but that the slope was steeper for syllables of lower association value. In Experiment 2, 4- and 32-choice lists of the same average association value nonsense syllables were read on 3 successive days, as were lists of common 3-letter words. The words showed zero slope against number of choices, and the slope for the nonsense syllables decreased with practice. These results are considered to support recent modifications to views on the role of information theory in psychology.—*Journal abstract.*

351. Duffy, James Francis. (U. Pennsylvania) *The effects of induced anxiety on the incidental learning of high and low anxious subjects.* *Desert. Abstr.*, 1961, 21(12), 3848-3849.—*Abstract.*

352. Fuchs, Alfred H. (Ohio State U.) *The progression-regression hypotheses in perceptual-motor skill learning.* *J. exp. Psychol.*, 1962, 63(2), 177-182.—The progression hypothesis predicts that learning a perceptual-motor skill entails weighting more subtle aspects of the displayed error signal more heavily. The regression hypothesis predicts that under stress the weighting would "regress" to a heavier emphasis on more apparent stimulus characteristics, but that recovery from stress follows the progression hypothesis. A system, consisting of analog computers and servomechanisms, was utilized to match the performance of S. The gain settings were treated as approximations of the weights assigned by S. The results confirmed the hypotheses, and the technique proved to be efficient and rapid. It was concluded that the beginning of a theory of perceptual-motor skill learning may be found in these results.—*J. Arbit.*

353. Games, Paul A. (Ohio U.) *A factorial analysis of verbal learning tasks.* *J. exp. Psychol.*, 1962, 63(1), 1-11.—100 college students were given a test battery designed to investigate the loadings of a series of verbal learning tasks on the Rote Memory and Span Memory factors. The tasks showed substantial loadings on the former, and negligible loadings on the latter factors. Method of presentation and constancy of order had no consistent effects. Practice produced a shift of the Repeated Span tests from the Span factor toward the Rote Memory factor. The free recall mode of response had no effect on the factor loadings. Additional factors specific to the experimental tasks were identified.—*J. Arbit.*

354. Hartman, Frank K. (Dickinson Coll.) *Recognition learning under multiple channel presentation and testing conditions.* *Audioris. Commun. Rev.*, 1961, 9(1), 24-43.—"Three experiments are described wherein information is presented simultaneously by all possible combinations of the audio, pictorial, and print channels and subsequently tested on the same variations of combinations of three channels." In general, multiple presentation does not increase learning over single channel presentation unless the test situation also contains the additional cues. Simultaneous redundancy "by the audio and print channels is more effective in producing learning than is the same information in either channel alone." When interference between the pictorial and verbal information exists, the pictorial is least affected by the competition. (23 ref.)—*E. L. Borrowman.*

355. Jahnke, John C. (Miami U.) *Posttest motor learning performance as a function of degree*

of learning. *J. exp. Psychol.*, 1961, 62(6), 605-611.—2 experiments studied the effect of degree of learning on posttest performance on the pursuit rotor. Both prerest and posttest performance data could be fit by a single family of curves. Reminiscence was an inverse monotonic function of amount of prerest distributed practice. The implication of this finding for the concept of temporary work inhibition is discussed. Some performance loss over rest (forgetting) was observed. The overall results were found to be compatible with the hypothesis that warm-up is positively related to amount of prerest practice.—*J. Arbit.*

356. Jensen, Arthur R., & Blank, Stanley S. (U. California) Association with ordinal position in serial rote-learning. *Canad. J. Psychol.*, 1962, 16(1), 60-63.—Woodworth once proposed that the learning of a serial list consists of the formation of S-R bonds between each item and its ordinal position (or a symbolic equivalent thereof), and that the bowing of the serial position curve is caused by the greater ambiguity of the ordinal positions near the middle. Constantly informing S of the position of each item should thus facilitate learning and make the curve less sharply bowed. Ss learned a series of 9 colored geometric forms by the method of anticipation. For one group a numeral in the center of each form identified order, while for the controls there were consonants in random order. The difference in labelling did not facilitate learning nor significantly alter the shape of the curve.—*R. S. Davidson.*

359. Rice, G. E., Jr., & Lawless, R. H. (Agnes Scott Coll.) Behavior variability and reactive inhibition in human stylus maze behavior. *Psychol. Rec.*, 1961, 11, 333-338.—Variability was studied in a multisectonal stylus-maze as a function of distance (2, 6, 18 cm.) between previous turn and choice point. The results indicated alternation behavior at the shortest and longest distances with one forced turn. However, with 2 successive forced turns, significant alternation occurred only at the 2 cm. distance. It was suggested that in humans, other factors as well as reactive inhibition may be operating.—*R. J. Seidel.*

360. Ryan, Francis J., & Bilodeau, Edward A. (Tulane U.) Countertraining of a simple skill with immediate and 1-week delays of informative feedback. *J. exp. Psychol.*, 1962, 63(1), 19-22.—“Fifty-seven Ss were first taught in eight massed trials to displace a lever by a certain amount. Following the eighth response, the intertrial interval became 7 days, the amplitude of response required was changed in order to obtain countertraining, and the delay in KR was changed for half the Ss. For one group KR occurred immediately; for the other KR was withheld for 7 days. Both groups learned to modify their responses reasonably soon. The immediate-KR group outperformed the delay group ($P = .05$), but

the null hypothesis was not rejected because several other internal and external results contradicted the .05 outcome.”—*J. Arbit.*

361. Saltz, Eli. (Wayne State U.) Response pretraining: Differentiation or availability? *J. exp. Psychol.*, 1961, 62(6), 583-587.—Response pretraining was hypothesized as a predifferentiation device, in contrast to Underwood's hypothesis that it is a procedure for making responses more available during subsequent association learning. The present study investigated the effect of response pretraining upon the facilitation of learning when the responses are made available to the Ss during subsequent association learning. “The results indicated that pretraining was effective even when the responses were available to all Ss. One of the major effects of pretraining proved to be the reduction of mean oscillation per correct response.”—*J. Arbit.*

362. Sinha, A. K. P., & Prasad, M. B. (Patna U.) Transfer as a function of the method of first-task learning. *J. gen. Psychol.*, 1962, 66, 311-314.—The purpose of this study was to investigate the difference between the transfer effects in (a) learning both 1st and 2nd tasks by the whole method and (b) learning the 1st task by the part method and the 2nd by the whole method. The results showed that positive transfer took place in both (a) and (b), learning the initial task by the part method proved superior to learning it by the whole method, and the amount of transfer in (a) was greater than in (b).—*Author abstract.*

[Involuntary memorization.] Moscow, USSR: RSFSR Academy Pedagogical Sciences, 1961. 562 p.—This is the 1st Soviet book to appear on “involuntary memorization,” which is viewed as a “legitimate product of activity which pursues some (nonmnemonic) purpose” in contradistinction to voluntary memorization, which is viewed as a special mnemonic activity. Data drawn from the author's own research are included.—*I. D. London.*

Conditioning

365. Baxter, James C. (U. Texas) Mediated generalization as a function of semantic differential performance. *Amer. J. Psychol.*, 1962, 75(1), 66-76.—The prediction that the generalization of GSR amplitude would be inversely related to the multidimensional distance of the noncritical words from the critical words was not supported in 2 experiments ($N = 20$ in each). A 2nd prediction that “differences in the slopes of generalization would occur as a function of the evaluative meaning of critical word” was supported by the data obtained by 40 other Ss. The bearing of these results on Osgood's position is presented.—*R. H. Waters.*

366. Crowne, D. P., & Strickland, Bonnie R. (Ohio State U.) The conditioning of verbal behavior as a function of the need for social approval. *J. abnorm. soc. Psychol.*, 1961, 63(2), 395-401.—The hypothesis tested herein is that need for approval will facilitate learning. Need for approval

was measured by the M-C Social Desirability Scale (Crowne & Marlowe, 1960); the learning task employed the model of verbal conditioning as used by Greenspoon (1955); the Ss were undergraduate psychology students. The results supported the hypothesis.—G. Frank.

367. Das, J. P. (Utkal U.) **Some correlates of verbal conditioning.** *Psychol. Stud., Mysore*, 1961, 6(1), 30-35.—2 verbal conditioning tasks requiring renewals of learned responses were given to 50 college students separately. The students were also administered the Maudsley Personality Inventory and the Progressive Matrices. The results show that "Intelligence has a positive relationship with certain measures of verbal conditioning. But extraversion and neuroticism have no relationship. No significant relation could be obtained between the two types of verbal conditioning."—U. Pareek.

368. Dulany, D. E., Jr. (U. Illinois) **Hypotheses and habits in verbal operant conditioning.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 261-263.—The traditional explanation of experiments related to conditioning of verbal behavior in terms of operant conditioning, i.e., learning without awareness, was questioned. It was hypothesized that such conditioning to cues given by E might be based on S's awareness of the cue and assumed meaning of such a stimulus. 2 experiments were performed, 1 where plural nouns were reinforced, and a 2nd to test the generalization of this acquired pattern on a word association test. The usual findings re: conditioning of plural nouns was replicated and there seemed to be a carry-over of the set to the word association test. However, some Ss seemed to be aware of the meaning of such a reinforcer as "um-hm." Moreover, response set was also seen to affect conditionability.—G. Frank.

369. Field, J. G., & Brengelmann, J. C. (Maudsley Hosp., U. London, England) **Eyelid conditioning and three personality parameters.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 517-523.—The effect upon eyelid conditioning of Ss characterized by extraversion, neuroticism, and rigidity was studied using prison inmates. The results indicated that only measures of rigidity correlated positively and significantly with varying degrees of eyelid conditioning.—G. Frank.

370. Golin, S. (State U. Iowa) **Incubation effect: Role of awareness in an immediate versus delayed test of conditioned emotionality.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 534-539.—"The purpose of the study was to test the view that conditioned emotionality, as measured by the GSR, increases after a delay and that this increase is greater when the subject is aware of the relation between the CS and UCS. Certain words were associated with shock. The subject was aware of the relation between one word and shock but was unaware of the relation between a second word and shock. The GSR to these words was compared to the GSR to a word not associated with shock." The results confirmed the hypothesis.—G. Frank.

371. Hetrick, W. Robert, & Haas, Kurt. (Bowling Green State U.) **Some personality correlates of verbal conditioning.** *J. Psychol.*, 1962, 53(2), 409-415.—It was held that certain personality variables known to have an effect upon the course of psychotherapy would similarly effect verbal conditioning because of some fundamental parallels be-

tween the therapy and conditioning processes. Therefore, it was hypothesized that scores on an ego-strength test would correlate positively with performance in a verbal conditioning task, while scores on measures of depression and psychopathy would be negatively correlated. Although all Ss were effectively conditioned, their performance was not demonstrated to be significantly related to any of the selected personality variables.—Author abstract.

372. Jones, Joan E. (U. Sydney) **The CS-UCS interval in conditioning short- and long-latency responses.** *J. exp. Psychol.*, 1961, 62(6), 612-617.—"An experiment was conducted in which a short- and long-latency response were conditioned at the same time in seven groups of 18 Ss, each group trained with a different CS-UCS interval, ranging from 20 to 1245 msec. The shapes of the learning curves obtained varied with the interval employed and the latency of the response being observed. The variations were consistent with predictions based on the two-principle theory of classical aversive conditioning. Differences between the functions relating performance to the CS-UCS interval for the two responses were also consistent with the theory."—J. Arbit.

373. King, Margaret S., Kimble, Gregory A., Gorman, John, & King, Richard A. (Duke U.) **Replication report: Two failures to reproduce effects of anxiety on eyelid conditioning.** *J. exp. Psychol.*, 1961, 62, 532-533.—Previous studies have shown that highly anxious Ss develop conditioned eyeblinks at a faster rate and to a higher asymptote than less anxious Ss. The 2 experiments reported are practically identical in methodology with these previous studies. They fail to show that highly anxious Ss condition better than less anxious Ss.—J. Arbit.

374. Korn, Sam J., & Welch, Livingston. (New York Hosp.) **Conditioned responses: Fact and artifact.** *J. Psychol.*, 1962, 53(2), 301-309.—The reliability of procedures, conventionally employed in CR studies, for the adaptation of GSR was questioned. In Experiment I a signal light was briefly presented, unreinforced, every 30-90 seconds for almost 25 minutes. GSR adaptation was not reliably maintained; responses persisted or recurred in an irregular manner. These data confirm the possibility that CR data are often compounded with artifacts of pseudo-conditioning. An alternative procedure—the continuous exposure of the Ss to one or another of a series of colored light signals—yielded rapid and reliable adaptation of GSR. The procedural and theoretical implications of these results are discussed.—Author abstract.

375. Le Ny, Jean-François. **Le conditionnement.** [Conditioning.] Paris, France: Presses Universitaires France, 1961. 172 p. NF 8.—In a detailed, basic description of classical conditioning, the author uses a physiological psychology frame of reference citing Russian, American, French, and British experiments and theories. Topics include the classic conditioned response, extinction, generalization, the roles of motivation and reinforcement, the expansion of the conditioning except to include 2 basic types of conditioning, and the application of conditioning to higher processes in man. (15-item bibliogr., & 89-term glossary)—R. O. Peterson.

376. Levy, L. H. (Indiana U.) The conditioning and generalization of changes in social perceptual dispositions. *J. abnorm. soc. Psychol.*, 1961, 63(3), 583-587.—This study examines hypotheses regarding the extent to which social perception may be effected by differential reinforcement and trait generalization. Ss are asked to judge photographs of faces as reflecting either one or the other of the following dimensions: safe-dangerous, good-bad, reliable-unreliable, and relaxed-tense. Selective response by E (saying "right" after the judgment "safe" was made, "wrong" after "dangerous") produced conditioning of the desired response and generalization to the other dimensions.—G. Frank.

377. Moore, John W., & Gormezano, I. (Indiana U.) Yoked comparisons of instrumental and classical eyelid conditioning. *J. exp. Psychol.*, 1961, 62(6), 552-559.—The acquisition and extinction of CRs in classical and instrumental avoidance eyelid conditioning were compared when the comparison was independent of the number and pattern of UCS occurrences. The effect of omitting vs. delayed onset of the UCS on some trials was also studied. The instrumental group showed a superior level of conditioning. The partial reinforcement procedure of UCS-omission resulted in greater resistance to extinction than UCS-delay. A classical conditioning group on 100% reinforcement was superior to all groups in acquisition but showed the least resistance to extinction. These and other findings are discussed in terms of several contemporary hypotheses of conditioning phenomena.—J. Arbit.

378. Prokasy, W. F., Hall, J. F., & Fawcett, J. T. (Pennsylvania State U.) Adaptation, sensitization, forward and backward conditioning, and pseudoconditioning of the GSR. *Psychol. Rep.*, 1962, 10(1), 103-106.—Six groups of Ss were given either forward conditioning, backward conditioning, pseudoconditioning, adaptation, or sensitization training followed by 10 extinction test trials. On the first test trial the conditioning group yielded performance that could be discriminated only from that of the adaptation group. By the end of the test trials, it was still not possible to differentiate the performances of the two sensitization groups and the forward conditioning group. These results suggest that care must be exercised in the interpretation of GSR data, particularly with respect to inferences concerned with the specific pairing of CS and UCS.—B. J. House.

379. Prokasy, William F., & Whaley, Francis L. (Pennsylvania State U.) The intertrial interval in classical conditioning. *J. exp. Psychol.*, 1961, 62(6), 560-564.—Twelve Ss were given extensive training in the classical eyeblink conditioning situation, where the main independent variable was the intertrial intervals of 5, 10, 15, 20, 25, and 30 sec. interspersed in an unpredictable order through the entire training series. Pooling the data of trials following each interval separately, it was found that response probability was not differentially affected by the immediate intertrial interval. Such results are incompatible with the hypothesis that response-produced inhibition accounts for the massed-space effects observed in earlier conditioning studies.—J. Arbit.

380. Prokasy, William F., Jr., & Whaley, Francis L. (Pennsylvania State U.) Manifest anxiety

scale score and the ready signal in classical conditioning. *J. exp. Psychol.*, 1962, 63(2), 119-123.—"With high and low Manifest Anxiety scores and presence or absence of a ready signal as the independent variables, 152 Ss served in a classical discrimination learning situation [eyeblink conditioning]. The principal findings were (a) that the ready signal depressed overall frequency of responding, and (b) that high-MA score Ss responded significantly more than did low-MA score Ss only under the signal condition."—J. Arbit.

382. Scott, Thomas John. (Pennsylvania State U.) The consistency of individual differences in conditionability in a verbal conditioning situation. *Dissert. Abstr.*, 1961, 22(1), 337-338.—Abstract.

383. Southwell, E. A. (U. Chicago) A note on "awareness" in verbal conditioning. *Psychol. Rep.*, 1962, 10(1), 40.—A criticism of a study by Krasner, Weiss, and Ullman on the basis of definition of "awareness" employed.—B. J. House.

384. Waters, Jerry E., & Kodman, Frank, Jr. (U. Kentucky) Abstract conditioning. *J. Psychol.*, 1962, 53(2), 441-452.—In order to investigate the phenomena of abstract conditioning, 20 suggestible and 20 nonsuggestible female Ss were exposed to a conditioning situation involving auditory and visual stimulus words and reinforcing events related to the meanings of the specific words. Although the results were inconclusive for suggestible Ss, abstract conditioning was demonstrated for nonsuggestible Ss by the occurrence of a greater GSR response to a critical stimulus word electric shock. However, the results failed to show a relationship between abstract conditioning and suggestibility as measured by the Release Test.—Author abstract.

385. Ymanskii, L. I. (Pedagogical Inst., Kursk, USSR) K voprosu o partial'nykh tipakh vysshei nervnoi deyatel'nosti cheloveka. [On the question of partial types of higher nervous activity in man.] *Vop. Psikh.*, 1961, No. 6, 154-160.—A review of previous work on partial types of nervous system—a la Pavlovian classification. The author distinguishes between 6 levels of partial types of nervous system. These involve mixtures of the more pure Pavlovian types. His distinctions are based on the presumed central mechanisms for the different types and their components, for example, "intersignal partialness, representing typological differences in the interaction of first and second signal system and occurring in man under domination of the first signal system." Data are presented for the only 3 Ss (out of 29 who were given a battery of conditioning tests) to show partialness of type of nervous system in relation to their conditionability.—H. Pick.

Discrimination

386. Bialer, Irv. (George Peabody Coll.) Primary and secondary stimulus generalization as related to intelligence level. *J. exp. Psychol.*, 1961, 62(4), 395-402.—"The present study was concerned with the relationship between verbal and cue-producing responses, intelligent behavior, and primary vs. secondary stimulus generalization. Under combined conditions of acquired distinctiveness and acquired

equivalence of cues, groups of intellectually normal, high grade retarded, and middle grade retarded (mongoloid) boys were compared as to the utilization of learned verbal responses in the transfer of a manipulative response. As predicted, there was a significant relationship between IQ level and transfer score, indicating that the relatively higher IQ groups responded significantly more on the basis of secondary stimulus generalization than did the relatively lower IQ groups.—*J. Arbit.*

387. Marx, Melvin H., Murphy, Wilton W., & Brownstein, Aaron J. (U. Missouri) Recognition of complex visual stimuli as a function of training with abstracted patterns. *J. exp. Psychol.*, 1961, 62(5), 456-460.—College students "were shown different presentations of complex visual stimuli and tested on their ability to identify distorted versions of the stimuli. A simple geometric technique, in which the fundamental stimulus pattern was represented by dots, circles, or squares, was found to be consistently superior as a means of training. Training which utilized only the main lines of the patterns was found to be more effective than the control (fully drawn) training stimuli for certain test items of a fragmentary sort. For test items in which the trained pattern was embedded in noise, control training was relatively more effective than line, although even here the geometric training stimuli were clearly superior."—*J. Arbit.*

388. Saltz, Eli, & Riach, Winifred J. (Wayne State U.) The effect of stress on stimulus differentiation. *J. exp. Psychol.*, 1961, 62(6), 588-593.—Ss learned to criterion either a discrimination between stimuli with overlapping stimulus elements, or one between nonoverlapping stimuli. Subsequent introduction of stress in the form of electric shock produced a decrement in performance. Most of this decrement was contributed by Ss who learned the discrimination to a relatively low criterion. These and other results are related to theories of differentiation and drive.—*J. Arbit.*

Verbal Learning

389. Adams, H. E., & Vidulich, R. N. (Louisiana State U.) Dogmatism and belief congruence in paired-associate learning. *Psychol. Rep.*, 1962, 10(1), 91-94.—Of 36 undergraduates, those with high scores on Rokeach's Dogmatism Scale were inferior on a paired-associate learning task to low scorers. Learning of a list of incongruent associates was more difficult for both groups than learning of congruent associates. Results were discussed in relation to theories of Spence and Rokeach.—*B. J. House.*

390. Asch, S. E., & Ebenholtz, S. M. (Swarthmore Coll.) The principle of associative symmetry. *Proc. Amer. Phil. Soc.*, 1962, 106, 135-163.—Association is not in itself directional, and backward association would seem to be as strong as forward. Recall of simultaneous presentation (form of figure and form of constituent member, large figure and included figure, part and whole) shows no asymmetry. Learning by the method of anticipation makes the 2nd member of a pair more available because it is more impressed. Familiarization of the S with all items to be associated later tends to render the items equally available and to reduce or abolish direc-

tional asymmetry. A sentence or a melody is not reversible because the meaning controls the directionality. The literature on backward association is reviewed and criticized.—*E. G. Boring.*

391. Ausubel, David P. (U. Illinois) A subsumption theory of meaningful verbal learning and retention. *J. gen. Psychol.*, 1962, 66, 213-224.—Meaningful learning and retention are primarily influenced by characteristic organizational trends in cognitive structure. Rote learning tasks, however, are largely isolated from cognitive structure and are thus primarily influenced by the interfering effects of concurrent, similar rote materials. According to this theory, the principal variables influencing the incorporability and longevity of meaningful material are (a) the availability in cognitive structure of relevant subsuming concepts at an appropriate level of inclusiveness, (b) the stability and clarity of these concepts, and (c) their discriminability from the learning task.—*Author abstract.*

392. Babladelis, Georgia. (U. Colorado) A study of the effects of a personality variable in verbal conditioning. *Dissert. Abstr.*, 1961, 21(10), 3160-3161.—*Abstract.*

393. Battig, William F., & Nelson, Douglas. (U. Virginia) Effect of kind of material and previous experience on paired-associate learning under repetition and non-repetition conditions. *Canad. J. Psychol.*, 1962, 16(2), 106-111.—Ss learned paired associate lists, using either the typical repetition (R) method or a nonrepetition (NR) one in which all incorrect pairs were replaced after each trial. The R condition was superior for 3 types of lists: adjectives, nonsense syllables, and shape-number pairs. Yet for the word-bigrams there was no significant difference between conditions, possibly attributable to their difficulty. R and NR pretraining had no differential effect on R and NR test-list performance. The results are consistent with the traditional conception of paired associate learning as an incremental process.—*R. S. Davidson.*

394. Buss, Arnold H. (U. Pittsburgh) Stimulus generalization with aggressive verbal stimuli: A new paradigm. *J. Psychol.*, 1962, 53(2), 417-424.—A new stimulus generalization paradigm was tested. 5 words of differing intensities of aggression were presented on each trial, and Ss learned to say either the most or least intense word. Different words were used on each trial. Generalization was tested by omitting the reinforced class of words. There were regular gradients of stimulus generalization, suggesting the utility of the new paradigm. The matching principle (tending to match response intensity to stimulus intensity) received equivocal support. Generalizing from intense to mild stimuli yielded steeper gradients than generalizing from mild to intense stimuli.—*Author abstract.*

395. Epstein, William. (U. Kansas) A further study of the influence of syntactical structure on learning. *Amer. J. Psychol.*, 1962, 75(1), 121-126.—2 types of material, nonsense syllables and meaningful words, were arranged either to simulate English syntax or in a random order. In a 2nd experiment both types of material were presented as serial items. Data from 48 Ss in the 1st experiment showed that the syntactical structure facilitated learning and supported the results from an earlier study

(see 36: 1CI85E). In the 2nd experiment, $N = 48$, confirmatory data were obtained since the "sentences" were no more readily learned in serial order than the same words in random order.—*R. H. Waters.*

396. Everstine, Louis. (U. Pittsburgh) **The conditioning of neurotic verbalizations.** *Dissert. Abstr.*, 1961, 21(12), 3849-3850.—*Abstract.*

397. Kazusa, Kimiko. (Kyoto U., Japan) [The mechanism of generalization and differentiation in paired-associate learning.] *Jap. J. Psychol.*, 1961, 32(5), 279-288.—Stimulus pairs of similar and dissimilar adjectives were coupled with common and different response items, resulting in 4 experimental conditions. Following original learning to a criterion of 5 errorless trials, each condition was learned under 2 types of transfer learning: the stimulus items were paired with letters of the alphabet as either a common or a different response. The results supported an hypothesis of a mediate process rather than "the traditional view of generalization and differentiation." Identical results were obtained when the study was replicated using nonsense syllables. (English summary.)—*J. Lyons.*

398. Lifton, Harvey, & Goss, Albert E. (U. Massachusetts) **Aural-visual transfer of paired-associates learning.** *J. gen. Psychol.*, 1962, 66, 225-234.—Lists of 8 pairs of dissyllables with stimulus members of high or low meaningfulness were used to demonstrate transfer of paired-associates learning from one sensory modality to another. Of the 40 undergraduate Ss, 20 had initial learning with aural presentation and relearning with visual presentation, both to a criterion of 1 perfect trial. The initial learning and relearning of the other 20 was in a visual-aural sequence. Within each sequence, 10 of the 20 Ss learned the list with stimulus members of high meaningfulness and the other 10 learned the list with stimulus members of low meaningfulness. Both initial learning and relearning were more rapid with aural than with visual presentation and with stimulus members of high than of low meaningfulness. Positive transfer in the form of correct responses on the first or recall trial and in terms of relearning was obtained for both aural-visual and visual-aural sequences. However, percentage savings in relearning, which expressed amount of transfer relative to initial learning, was not influenced by sequence or meaningfulness.—*Author abstract.*

399. McGehee, Nan E., & Schulz, Rudolph W. (Northwestern U.) **Mediation in paired-associate learning.** *J. exp. Psychol.*, 1961, 62(6), 565-570.—2 experiments were conducted to determine how language habits inferred from free-association norms might mediate the learning of paired associates. It was found that the response-recall phase of test-list acquisition is not facilitated in a mediated condition. Under the mediated condition, the associative phase of test-list acquisition is facilitated via the specific associative chains linking the stimulus and response units of the respective pairs and that free-association norms are critical in defining these associative chains.—*J. Arbit.*

400. McGuire, William J. (Yale U.) **A multi-process model for paired-associate learning.** *J. exp. Psychol.*, 1961, 62(4), 335-347.—A quantitative model which relates the strength of 3 habit connections postulated to occur in paired-associate learning

to various aspects of performance on this task was described and deductions from this model experimentally tested with college students. The results in terms of learning scores and intrusion errors during practice support the predictions from the theory. Stimulus generalization in paired-associate learning was also discussed. (29 ref.)—*J. Arbit.*

401. Martin, James Gordon. (U. Minnesota) **Mediated transfer in two verbal learning paradigms.** *Dissert. Abstr.*, 1961, 21(10), 3174.—*Abstract.*

402. Newman, Slater E., & Saltz, Eli. (North Carolina State Coll.) **Serial position as a cue in learning.** *Amer. J. Psychol.*, 1962, 75(1), 102-108.—Each ($N = 20$) of 3 groups was given 5 presentations of a 10-pair list, followed by immediate recall. 2 groups, SS and SD, received the pairs in the same order during the 5 learning trials. In the retention test, Group SS received the stimulus items in the same order but Group SD received them in a different order. A 3rd group (R) received the pairs and the stimulus items in a different random order on each trial. It was predicted that if serial position served as a cue for learning and retention, SS would be superior to SD and R. As it turned out, SS and SD were superior to R and not significantly different from each other. Serial position does not seem to be an independently acting cue in paired associate learning, although it may be one element in a compound stimulus matrix.—*R. H. Waters.*

403. Roberts, William A. (U. Maryland) **A further test of the effect of isolation in serial learning.** *Amer. J. Psychol.*, 1962, 75(1), 134-139.—The effect of increasing the number of isolated items within a 175-item list to 3 instead of the typical single isolated item and the effect of a difference in meaningfulness between the "isolates" and the remainder of the items were studied in terms of the ease of learning the isolated items as responses, their role as stimuli, errors in learning the entire list, and the frequency of intrusion-errors from the isolated terms. The results obtained do not lend themselves to an interpretation in terms of intraserial generalization and suggest an "interaction of degree of isolation and meaningfulness."—*R. H. Waters.*

404. Saltz, E., & Ager, J. W. (Wayne State U.) **Issues in scaling meaningfulness: Noble's revised CVC norms.** *Psychol. Rep.*, 1962, 10(1), 25-26.—"Reservations regarding Noble's m' scale in terms of its relation to performance are discussed. Relations between Glaze values, Noble a' values, and Underwood and Schulz's PR values with learning are reported to vary."—*B. J. House.*

405. Sugimura, Takeshi. (Osaka Classification Office for Juvenile Delinquents, Japan) [Associative transfer in verbal paired-associate learning of the A-B, A-Br paradigm as a function of the amount of prior learning.] *Jap. J. Psychol.*, 1961, 32(5), 289-295.—2 experiments were carried out to test the effect of degree of prior learning on associative transfer. In each study Ss learned a list of pairs of 2-syllable nouns, followed by a 2nd list of the items paired in new combinations. The results were interpreted as evidence for the author's "two-factor theory of learning," on the basis of findings that "specific S-R combinations in the first list have negative effects on the learning of the second list, while

general learning sets facilitate it." (English summary)—*J. Lyons.*

406. Umemoto, Takao. (Kyoto U., Japan) Paired-associate learning as a function of similarity: Semantic similarity between stimulus- and response-items. *Amer. J. Psychol.*, 1962, 75, 85-93.—In 2 experiments, one done in Japan and the other in the United States, intrastimulus and intrasubject similarities were held constant, while the similarity between stimulus- and response-items of the pairs varied from high to medium to low. "In both experiments the lists with the most similar S-R items were the easiest to learn." The relative positions of the other 2 lists were reversed. The results were interpreted in terms of the Postman-Riley hypothesis of initial response-bias (see 32: 243).—*R. H. Waters.*

407 Underwood, Benton J., & Schultz, Rudolph W. (Northwestern U.) Studies of distributed practice: XXI. Effect of interference from language habits. *J. exp. Psychol.*, 1961, 62(6), 571-575.—3 studies evaluated the influence on learning of the interaction between intertrial interval and interference. Bigrams, trigrams and words were used in a paired associate learning task with college students. Distributed practice facilitates acquisition only when interference was obtained in response learning, and not when interference occurred in stimulus-response learning.—*J. Arbit.*

408. Waugh, Nancy C., Smith, J. E. Keith. (Harvard U.) A stochastic model for free recall. *Psychometrika*, 1962, 27(2), 141-154.—A statistical model for verbal learning is presented and tested against experimental data. The model describes a Markov process with realizable absorbing state, allowing complete learning on some finite trial as well as imperfect retention prior to this trial.—*Journal abstract.*

409. Williams, Joanna P. (Yale U.) Supplementary report: A selection artifact in Rock's study of the role of repetition. *J. exp. Psychol.*, 1961, 62(6), 627-628.—Rock has reported that Ss who had the original items of a list of paired associates presented repeatedly on every trial learned no faster than Ss for whom item repetition was omitted by substituting new pairs for those answered incorrectly. The present study questions the possibility that the items in the list were not equal in difficulty and that Ss in the nonrepetition group eliminated the difficult items. The results support the possibility of the presence of such a selection bias.—*J. Arbit.*

Reinforcement (Including Probability Learning)

410. Aronson, E. (Harvard U.) The effect of effort on the attractiveness of rewarded and unrewarded stimuli. *J. abnorm. soc. Psychol.*, 1961, 63(2), 375-380.—Dissonance theory suggests that stimuli gain in attractiveness in relation to the amount of energy expended to achieve them regardless of whether they are associated with reinforcement or not; whereas reinforcement theory suggests that only stimuli associated with reward gain in attractiveness. By systematically manipulating the degree of reward and expenditure of effort, it was hypothesized that a test of the validity of one or the other of the hypotheses could be made. Ss were asked to perform tasks which varied in difficulty and

reward. They were also asked to rate the relative attractiveness of the stimuli before and after being exposed to the experimental conditions. The results demonstrated an interaction between the effects of cognitive dissonance and secondary reinforcement.—*G. Frank.*

411. Berry, R. N. (Indiana U.) Effect of two reinforcement ratios on human skin conductance levels. *Psychol. Rep.*, 1962, 10(1), 15-18.—"A task presented as having a solution but actually having none, was presented for 30 trials, over a 10-min. interval, to each of 76 male Ss. Half the Ss were given 15 of 30 possible verbal reinforcements, the other half were given only 5 such reinforcements." Results of skin conductance measures showed "a significantly larger number of high reinforcement, as opposed to low reinforcement, Ss with a conductance value moving in the direction of 1.40 μ mhos during the task interval," a value previously shown to be optimum for verbal recall.—*B. J. House.*

412. Brackbill, Yvonne; Kappy, Michael S., & Starr, Raymond H. (Johns Hopkins U.) Magnitude of reward and probability learning. *J. exp. Psychol.*, 1962, 63(1), 32-35.—"This study investigated probability learning in a binary choice, non-contingent procedure with 0, 1, 3, and 5 units of reward for each correct prediction, 100 units being exchangeable for one toy. The Ss were second-grade children. Maximum gain responding increased with larger values of reward, although the function relating these two variables did not appear to be linear. From a first order sequence analysis, an independent effect emerged through an unexpected source of reinforcement: the utility to S of correctly predicting the occurrence of the less frequent event."—*J. Arbit.*

413. Carment, D. W., & Miles C. G. (McMaster U., Canada) Resistance to extinction and rate of lever-pulling as a function of percentage of reinforcement and number of acquisition trials. *Canad. J. Psychol.*, 1962, 16(2), 145-151.—Human Ss were instructed to repeatedly pull a lever to obtain poker chips, and received either 12½%, 25%, or 50% reinforcement. The number of responses after either 8, 16, or 64 acquisition trials was taken as a measure of resistance to extinction. The higher the percentage of reinforcement and the larger the number of acquisition trials, the fewer the number of responses to extinction. "The relations may not hold if the response employed, in contrast to lever-pulling, requires the Ss to learn."—*R. S. Davidson.*

414. Chapman, Jean P. (Northwestern U.) The spacing of sequentially dependent trials in probability learning. *J. exp. Psychol.*, 1961, 62(6), 545-551.—"This experiment on probability learning was designed to test several predictions from the Burke and Estes model and from an extension of this model by Witte. A total of 120 Ss were tested on a Humphrey's-type light guessing apparatus. The series of reinforcing events were sequentially dependent. The results showed that neither model adequately predicted performance on massed trials when the conditional stimulus was high, although both models did somewhat better at predicting performance when the conditional probability was low. . . . There is some evidence that the model predicts qualitative but not quantitative changes from distributed

trials. The marginal response behavior revealed that response probability was consistently below the stimulus marginal probability."—*J. Arbit.*

415. Diggory, James C., & Ostroff, Bena. (U. Pennsylvania) Estimated probability of success as a function of variability in performance. *Amer. J. Psychol.*, 1962, 75(1), 94-101.—The results support earlier findings that S's estimate of success in a task declines as he nears the goal. They also show that this rate of decline is less if the approach to the goal is irregular and that estimations of success are based on nearness to the goal or to the temporal deadline and on the shape of the performance-curve.—*R. H. Waters.*

416. Edwards, Ward. (U. Michigan) Probability learning in 1000 trials. *J. exp. Psychol.*, 1961, 62(4), 385-394.—120 basic airmen trainees made a sequence of 1000 predictions about which of 2 mutually exclusive events would occur. After each prediction one of the events occurred; the probability of occurrence of each event was constant. Probability matching did not occur. Ss showed probability following in that their predictions changed on the basis of the relative frequency of the event in a block of trials. The effect of the immediately preceding trials was found to be most important. In early trials the longer the run of an event, the less likely was S to predict it (the gambler's fallacy), while in later trials the longer the run the more likely was S to predict its occurrence. (26 ref.)—*J. Arbit.*

417. Erlebacher, Albert, & Archer, E. James. (U. Wisconsin) Perseveration as a function of degree of learning and percentage of reinforcement in card sorting. *J. exp. Psychol.*, 1961, 62(5), 510-517.—"An experiment relating perseveration to percentage of reinforcement and degree of learning was performed using a modified form of the Wisconsin Card Sorting Test. The results showed that there was a significant interaction between these two variables. . . . These results were discussed in terms of the similarity of the pattern of reinforcement during the acquisition stage and the nonreinforcement of the same response during the extinction stage. Supposedly, similarity leads to generalization and thus, slower extinction (greater perseveration)."—*J. Arbit.*

418. Fort, Jane G., Myers, Jerome L., & Myers, Nancy A. (U. Massachusetts) Secondary reinforcement in a discrimination problem. *J. gen. Psychol.*, 1962, 66, 159-168.—A buzz was paired with money for correct responses in a discrimination problem. During extinction, the buzz maintained a high level of correct responding. A 2nd experiment replicated the 1st with the addition of 1 parameter—number of acquisition trials. The results of the 2nd experiment suggested again the presence of strong secondary reinforcement effects, although the habit strength parameter was not significant.—*Author abstract.*

419. Griswold, Betty J., & Luce, R. Duncan. (Columbia U.) Choices among uncertain outcomes: A test of a decomposition and two assumptions of transitivity. *Amer. J. Psychol.*, 1962, 75(1), 35-44.—"A gambling experiment employing both money and cigarettes as the outcome was run to test three assumptions" proposed by Luce in the literature of economics. "Ignoring those pairs of

gambles involving at least one pair of inconsistently preferred brands, we found strong support for the transitivity-assumption and more modest support for the strong stochastic transitivity- and decomposition-assumptions."—*R. H. Waters.*

420. Jones, Austin. (U. Pittsburgh) The relative effectiveness of positive and negative verbal reinforcers. *J. exp. Psychol.*, 1961, 62(4), 368-371.—A test of the hypothesis that the word "wrong" is a stronger reinforcer than the word "right." Psychiatric inpatients and college students were used. In the college group "wrong" appeared to be a stronger reinforcer than "right." The reverse was true for the psychiatric patients.—*J. Arbit.*

421. Kapostins, Eli Eglons. (Columbia U.) The effects of differential reinforcement of low rate on word utterance. *Dissert. Abstr.*, 1961, 22(1), 334-335.—*Abstract.*

422. Kozielski, J. Badanie strategii myślenia w trudnych sytuacjach probabilistycznych. [Investigation of the strategy of thinking in difficult probabilistic situations.] *Psychol. wych.*, 1961, 4(4), 384-395.—6 cards containing 4 different letters from among the 1st 6 letters of the alphabet were presented serially to 30 Ss. After each card was shown, the experimenter stated whether the card was positive (contained code) or negative. 2 of the statements were false. The S was asked to discover the code and whether he was told the truth. The results showed that S trusted positive and confirming information rather than negative and nonconfirming information.—*H. Kaczkowski.*

423. LaBerge, David, Greeno, James G., & Peterson, O. F. (U. Minnesota) Nonreinforcement and neutralization of stimuli. *J. exp. Psychol.*, 1962, 63(2), 207-213.—6 groups of 48 college students tested the hypothesis that nonreinforcement connects at least part of the sampled elements to responses other than the choice alternatives in a 2-choice learning situation. Evidence supporting the hypothesis was obtained. The results are discussed in terms of a mathematical model of learning as well as the neutralization and identity hypotheses.—*J. Arbit.*

424. Lanzetta, John T., & Kanareff, Vera T. (U. Delaware) The effects of congruent and conflicting social and task feedback on the acquisition of an imitative response. *J. exp. Psychol.*, 1961, 62(4), 322-328.—In college students, social reinforcement (emotional response of a partner) was compared with task reinforcement (indication of correctness) when both were congruent or in conflict. The frequency of using an imitative response in a 2-choice prediction was measured. The social reinforcer was less effective in modifying behavior than an objective indication of response adequacy, even when the emotional response of the partner was made instrumental to more remote goals.—*J. Arbit.*

425. Lewis, Donald J., & Duncan, Carl P. (Rutgers U.) Expectation and resistance to extinction under partial reinforcement and risk-taking. *Amer. J. Psychol.*, 1962, 75(1), 77-84.—2 groups of 150 Ss each were given disks worth 1¢ and 5¢, respectively, with which to play a slot machine. S lost or won a disk on each play. 5 percentages of reinforcement (payoff) were used on the 1st 9 trials: 0%, 11%, 33%, 67%, and 100%.

After the 9th trial the machine did not pay off again (extinction) and the Ss could stop whenever they wished. Resistance to extinction decreased with increases in reinforcement, and Ss' expectancies during acquisition and extinction changed differentially with the percentage of reinforcement.—R. H. Waters.

426. Lindman, Harold, & Edwards, Ward. (U. Michigan) **Supplementary report: Unlearning the gambler's fallacy.** *J. exp. Psychol.*, 1961, 62(6), 630.—Edwards has reported that as the length of a homogeneous outcome run increases, the probability that it will be predicted by S increases. Other studies have reported the opposite finding: as the length of a homogeneous outcome run increases, the probability that S will predict that event decreases (this is the gambler's fallacy). The present study replicates the earlier findings by Edwards, i.e., the small tendency toward a gambler's fallacy in the early trials is replaced by the opposite tendency beginning by Trial 100. It was concluded that the gambler's fallacy is a very evanescent phenomenon.—J. Arbit.

427. Neimark, E. D. (New York U.) **Effect of incentives upon the role of "social" cues and reinforcers in probability learning.** *Psychol. Rep.*, 1962, 10(1), 215-221.—"A total of 112 Ss were run three at a time on a modified probability learning task in which they were to predict the occurrence of E_1 or E_2 upon presentation of a cue s_1 or s_2 . Treatment of groups differed with respect to attributed source of s_1 and E_1 (social vs. nonsocial) and presence or absence of incentive (a \$10 prize for greatest accuracy of prediction)." Results suggested that "social cues make for lower levels of prediction than nonsocial cues but that the effect may be contingent upon Ss' motivation."—B. J. House.

428. Rosenbaum, Milton E., & Tucker, Irving F. (State U. Iowa) **The competence of the model and the learning of imitation and non-imitation.** *J. exp. Psychol.*, 1962, 63(2), 183-190.—College students predicted the outcomes of a series of fictitious horse races after exposure on each trial to the prediction and correctness of the prediction made by a simulated partner. Under training to imitate, the results indicate that the greater the model's competence, the greater is the facilitation of the learning process. Under training to nonimitate, learning was facilitated when the model's competence was high or low but was poorer when the model's adequacy was mediocre. The results were discussed as reflecting the effect of prior social learning experiences on current social behavior.—J. Arbit.

429. Simpson, William, & Voss, James F. (Coll. of Wooster) **Psychophysical judgments of probabilistic stimulus sequences.** *J. exp. Psychol.*, 1961, 62(4), 416-422.—1 of 2 lights was presented in a sequence of 50 stimulus presentations. Stimulus probability was manipulated by varying the relative number of each of the 2 lights in the sequence. Judgments made at the end of each series of 50 lights regarding the estimated occurrence of 1 light provided a response measure of estimated probability. 9 probability conditions were employed. Ss tended to overestimate probabilities from .60 to .90 and underestimate probabilities from .10 to .40. These and other results are discussed in relation to probability learning and decision making.—J. Arbit.

430. Weiner, Harold. (St. Elizabeth's Hosp., Washington, D. C.) **Some effects of response cost upon human operant behavior.** *J. exp. Anal. Behav.*, 1962, 5(2), 201-208.—Using adult males, the effects of cost (point loss per response) were investigated upon observing responses maintained by VI and FI schedules of reinforcement (acquisition of points via critical-signal detections). All 3 experiments emphasized the importance of cost as a factor in maintenance of human behavior on schedules of positive reinforcement.—J. Arbit.

431. Zipf, Sheila G. (U. California, Berkeley) **The effects of amount of reward, requirement, and several related probabilities on human performance.** *J. exp. Psychol.*, 1961, 62(5), 503-509.—The effect of amount of reward, probability of reward for successful performance, probability of success, and amount of increase in speed required was investigated in an IBM-card sorting task. Probability of success and required increase in speed had significant effects on performance. No conclusion was possible for probability of reward. Amount of reward was not effective although the desire to obtain a reward was related to performance. No evidence for a multiplicative relationship between these variables was found. (18 ref.)—J. Arbit.

Learning Theory

432. Capaldi, E. J. (U. Texas) **On partial and delayed reinforcement.** *Psychol. Rep.*, 1962, 10(1), 10.—A discussion of criticisms by Wike of a study by Cogan and Capaldi.—B. J. House.

433. Carterette, Teresa S. (Indiana U.) **An application of stimulus sampling theory to summated generalization.** *J. exp. Psychol.*, 1961, 62(5), 448-455.—2 experiments tested predictions from a mathematical model derived from the Burke-Estes stimulus sampling theory. The 1st, an experiment concerned with simple stimulus generalization, yielded estimates of parameters which were used to generate theoretical curves for the 2nd, concerned with summated stimulus generalization. Ss were college students. In general, the predictions were confirmed.—J. Arbit.

434. Fey, Curt F. (U. Pennsylvania) **Parameter invariance in models for learning.** *Dissert. Abstr.*, 1961, 22(1), 331.—Abstract.

435. Linhart, J., & Michalička, M. (Pedagogický ústav ČSAV, Prague) **K metodologickým otázkám studia motivace v procesech učení a poznání.** [Concerning the methodology of the study of motivation in the learning and cognitive processes.] *Ceskoslov. Psychol.*, 1961, 5, 209-222.—A brief description, analysis, and critical review of some contemporary theories of western psychologists and neuropsychologists regarding the problems of determination and motivation in learning and cognitive processes. Much new experimental material does not include a causal explanation of the motivation of human learning and behavior. (61 ref., Russian & English summaries)—V. Bricháček.

436. Stevens, Joseph C., & Savin, Harris B. (Harvard U.) **On the form of learning curves.** *J. exp. Anal. Behav.*, 1962, 5(1), 15-18.—"In a wide variety of learning experiments, cumulated measures of performance turn out to be a power function of practice time or number trials, typically with an ex-

ponent between 1 and 2. The effects of various conditions on the course of learning can frequently be described in terms of the two constants of the function."—*Author abstract.*

437. Suppes, P., & Schlag-Rey, M. (Stanford U.) **Test of some learning models for double contingent reinforcement.** *Psychol. Rep.*, 1962, 10(1), 259-268.—Predictions from 10 generalized conditioning one-element models were compared for data from 20 students on a 2-response learning task with probability of reinforcement contingent upon the 2 immediately preceding responses. "The conditioning parameters of five (Class I) were defined in terms of concrete positional variables like an E_1 or an A_1E_2 response-reinforcement pair. The parameters of the other five (Class II) were defined in terms of relational variables like a punishing or rewarding reinforcement, or a repeating or alternating response. . . . The fit to the data of the relational models (Class II) was in every case better than that of the corresponding positional model (Class I)."—*B. J. House.*

RETENTION & FORGETTING

438. Baron, Naomi. (Beltsville, Md.) **Memory and emotion.** *Amer. Psychologist*, 1962, 17, 146-148.—The purpose of this study by a 9th grade student "was to see if there were a relationship between memory and emotions." 121 Ss (junior high school students) viewed 30 words successively, each being exposed for a period of $2\frac{1}{2}$ sec., and then were instructed to recall them in writing. A week later dittoed lists of the same words were rated on a 5-point scale of unpleasantness-pleasantness by the Ss. "The difference in the kind of feeling, i.e., pleasant or unpleasant, seems to have no effect on memory. . . . Intensity of emotion does appear to affect memory."—*S. J. Lachman.*

439. Colbert, John. (New York U.) **The effects of musical stimulation on recall in high and low anxiety college students: A comparison of some effects of musical stimulation on the recall of letter configurations and nonsense syllables in high and low anxiety college students.** *Dissert. Abstr.*, 1961, 21(10), 3172.—*Abstract.*

440. Conrad, R. (Medical Research Council, Cambridge, England) **An association between memory errors and errors due to acoustic masking of speech.** *Nature, Lond.*, 1962, 193, 1314-1315.—A method is reported of studying change in the memory trace by observing whether recall errors show any systematic tendency. Sequences containing 6 letters of the alphabet formed the material to be recalled by 300 Ss. 2 sensory modes were involved: visual and auditory. Results showed systematic errors in immediate memory for certain letters of the alphabet. Significance of the experiment lies in the fact that neurological noise in the memory system seems to affect the memory trace of a stimulus in much the same way as acoustic noise affects its auditory perception.—*M. C. Benton.*

441. Goss, Albert, E., & Nelson, Jane Van Dyke. (U. of Massachusetts) **Retention of paired associates as a function of percentage of occurrence of response members.** *J. gen. Psychol.*, 1962, 66, 203-211.—Retention of anticipatory responses of a list of 8 nonsense-syllable

paired associates was measured 15 min., 24 hr., and 48 hr. after acquisition of those response to a $\frac{1}{2}$ criterion under 25% and 100% schedules of occurrence of response members. The nonsense syllables were of low similarity to each other and of intermediate Glaze association values. 10 undergraduate men and women were randomly assigned to each of 6 combinations of the 2 acquisition schedules and 3 retention intervals. There were more correct responses on the 1st relearning or recall trial and fewer trials and correct responses to the $\frac{1}{2}$ relearning criterion after 15 min. than after 24 hr. or 48 hr., but amount retained was apparently unrelated to the percentage of occurrence of response members under which the anticipatory responses were acquired.—*Author abstract.*

442. Hanawalt, Nelson G., & Tarr, Arlene G. (Rutgers U.) **The effect of recall upon recognition.** *J. exp. Psychol.*, 1961, 62(4), 361-367.—The effect of interpolated recall upon recognition was measured at different time intervals. Interpolated recall produced equivocal evidence for a facilitating effect upon recognition when recognition followed immediately after recall. When recognition was delayed 48 or 52 hr., the facilitating effect was unequivocal. The disagreement of the present results with some recent studies showing a depressing effect of recall upon recognition was discussed in the light of possible factors accounting for the differences.—*J. Arbib.*

443. Koppelaar, R. J., & Ohara, G. N. (U. Manitoba, Canada) **The combined effect of retroaction and proaction.** *Canad. J. Psychol.*, 1962, 16(2), 96-105.—To test for an interaction between proactive and retroactive inhibitory effects, lists of 2-syllable adjectives were learned by the method of paired associates. Under the combined condition (RIP) the prior, critical and interpolated learning, the brief retention interval, and the recall and relearning were all given in one continuous session. Control conditions had either prior learning (PI), interpolated learning (RI), or rests. Retroactive inhibition was greater than proactive. Intrusions from prior lists increased markedly from the PI to the RIP conditions, but there was no such increase in retroactive intrusions. Recall under RIP could be predicted from the sum of the RI and PI effects. Doubling the length of the PI or RI lists had less of an effect than the RIP condition.—*R. S. Davidson.*

444. Lloyd, Kenneth E. (Washington State U.) **Supplementary report: Short-term retention as a function of average storage load.** *J. exp. Psychol.*, 1961, 62(6), 632.—Previous studies found recall errors to be systematically related to the average number of items Ss were required to remember. The present study supplements this work by extending the average storage load to higher values, and by using as items words judged to be unrelated. Recall errors were found to increase regularly with average storage load with related or unrelated items and under conditions where Ss recalled one or several items at each recall point.—*J. Arbib.*

445. Mackworth, Jane F. (Defence Research Medical Lab., Toronto, Canada) **The effect of the response upon the immediate memory span.** *Canad. J. Psychol.*, 1962, 16(2), 120-127.—Messages of 9 or 10 digits were presented at 3 speeds, either as a block display or with digits shown separately, and S either dictated or pressed labelled buttons. Type of

display, speed, and response method had significant effects upon memory span. Manual response decreased the number of digits recalled, a difference not attributable to rate of response. The familiarity of the response situation may be important.—*R. S. Davidson.*

446. Mackworth, Jane F. (Defence Research Medical Lab., Toronto, Canada) **Presentation rate and immediate memory.** *Canad. J. Psychol.*, 1962, 16(1), 42-47.—Each of 8 or 9 digits of a message was projected on a screen in successive positions from left to right (2 or 3 rows). Rate varied from $\frac{1}{4}$ to 2 seconds per digit. More messages were correctly recalled at the slower rates, and the number of digits per message correctly recalled was greater. These results do not support the decay theory of memory.—*R. S. Davidson.*

447. Mackworth, Jane F. (Defence Research Medical Lab., Toronto, Canada) **The visual image and the memory trace.** *Canad. J. Psychol.*, 1962, 16(1), 55-59.—The duration of exposure of messages was varied from $\frac{1}{8}$ to 2 sec. for 8-digit messages, and from $\frac{1}{8}$ to 16 sec. for 12-digit messages. For durations of 1 sec. or less there was a linear relationship between duration and number of digits correctly recalled, and it is suggested that the visual image is the limiting factor. At durations of more than 4 sec. the limiting factor is memory capacity.—*R. S. Davidson.*

448. Murdock, Bennet B., Jr. (U. Vermont) **The retention of individual items.** *J. exp. Psychol.*, 1961, 62(6), 618-625.—“Three experiments were conducted on the short-term retention of individual items. Experiment I confirmed the findings of Peterson and Peterson and suggested that the number of items or ‘chunks’ of information in the to-be-remembered stimulus item may be a significant variable in short-term retention. Experiment II demonstrated a significant proactive inhibition effect and suggested that the effect may be a U shaped function of number of preceding items. Experiment III showed that the rate of interpolated activity did not have a significant effect on short-term retention. The implications for a decay theory and an interference theory of forgetting were briefly discussed.”—*J. Arbit.*

449. Reid, Lyne Starling; Lloyd, Kenneth E., Brackett, H. Ray, & Hawkins, William F. (U. Virginia) **Short-term retention as a function of average storage load and average load reduction.** *J. exp. Psychol.*, 1961, 62(5), 518-522.—“Two experiments are reported in which short-term retention was studied in a situation requiring S to remember familiar English words until their recall was requested. During the time S was required to remember these items he was presented other words or asked to recall previously presented items. . . . in a task where the recall of more than one item could be requested at a given point in the sequence, errors increased systematically as the average number of words to be remembered over blocks of recall points, average storage load, was increased. . . . when the average number of items to be remembered was held constant, errors decreased as the average number of items to be recalled at given points, termed average load reduction, was increased.”—*J. Arbit.*

450. Rothkopf, Ernst Z., & Coke, Esther U. (Bell Telephone Lab.) **The prediction of free re-**

call from word association measures. *J. exp. Psychol.*, 1961, 62(5), 433-438.—Hypothesized that the frequency of recall of a given word in a free recall situation depends directly on the number of cues which are provided by other words in the list. The cue number of word W was defined as the number of words in the learning list for which W is normally given as an association response in a word association test. High school students were presented with each of the 99 words on the Kent-Rosanoff list for 5 sec. and tested for recall after 15 min. Support was found for the hypothesis tested.—*J. Arbit.*

451. Smirnov, A. A. (Ed.) **Voprosy psikhologii pamiati.** [Problems in the psychology of memory.] Moscow, USSR: RSFSR Academy Pedagogical Sciences, 1958. 216 p.—This collection of articles presents the results of experimental investigations devoted to the study of the “conditions essential to successful memorization and memory development in children.” Major attention is directed to the development of meaningful memorization and to the role of visual imagery in memory processes.—*I. D. London.*

452. Tulving, Endel, & Patkau, Jeannette E. (U. Toronto, Canada) **Concurrent effects of contextual constraint and word frequency on immediate recall and learning of verbal material.** *Canad. J. Psychol.*, 1962, 16(2), 83-95.—Immediate recall on 6 successive learning trials was determined, with 2 levels of frequency of words orthogonally combined with 5 degrees of contextual constraint. An interaction between word frequency and context was found when number of words recalled was the response variable, but when “adopted chunks” (sequences from input lists) were counted there was no interaction nor difference in recall attributable to word frequency. The importance of subjective organization was discussed.—*R. S. Davidson.*

453. Underwood, Benton J., & Keppel, Geoffrey. (Northwestern U.) **An evaluation of two problems of method in the study of retention.** *Amer. J. Psychol.*, 1962, 75(1), 1-17.—The 2 methodological problems were (a) the control of rehearsal during the retention interval, and (b) the control measure to use so that measurements of retention would not be confounded by differences in degree of original learning. Experimental evidence showed that the 1st problem could not be solved by the use of instructions. 3 solutions to the 2nd were evaluated: a projection of the probable next trial learning score and use of control Ss who (a) were given an immediate recall or, (b) were continued through a postcritical trial. The 1st solution was rejected in favor of either the 2nd or 3rd alternative.—*R. H. Waters.*

454. Waugh, Nancy C. (Harvard U.) **Free versus serial recall.** *J. exp. Psychol.*, 1961, 62(5), 496-502.—The free and serial recall of lists of monosyllabic English words was compared over the course of 6 trials. The curve for serial recall is linear, the curve for free recall is negatively accelerated. This difference results from the fact that fewer new words are learned on each successive trial when recall is free, while an approximately constant number are learned when recall is serial. Free recall was not found to depend in any way on whether the words to be learned were scrambled before every trial or were presented in the same order on all trials. Thus contiguity does not appear to be an important variable. (19 ref.)—*J. Arbit.*

455. Wittrock, M. C., & Husek, T. R. (U. California, Los Angeles) Effect of anxiety upon retention of verbal learning. *Psychol. Rep.*, 1962, 10(1), 78.—Retention of a complex passage of Buddhism was significantly higher for a group of 96 undergraduates who learned the material immediately before a midsemester examination than for a group of 66 who learned during a regular class. The former also scored higher on an Anxiety Differential test.—B. J. House.

THINKING

456. Arieti, Silvano. (22 E. 72nd St. NYC) The microgeny of thought and perception: A psychiatric contribution. *Arch. gen. Psychiat.*, 1962, 6(6), 454-468.—Psychic and brain pathology give some clues to the unconscious processes through which both thinking and perception go before reaching the final result. Stages of "primary aggregation" and "formation of primary categories" showing fragmentation or false wholes can be observed in thinking. "Perceptions go through . . . pre-Gestalt stages." Examples from schizophrenic, neurotic, and brain-injured patients are presented and discussed. (84 ref.)—L. W. Brandt.

457. Bach, Sheldon. (New York U.) Symbolic associations to stimulus words in subliminal, supraliminal, and incidental presentation. *Dissert. Abstr.*, 1961, 21(11), 3519-3520.—Abstract.

458. Ennis, Robert H. (Cornell U.) A concept of critical thinking. *Harv. educ. Rev.*, 1962, 32(1), 81-111.—Construing critical thinking as "the correct assessing of statements," 12 overlapping characteristics of the critical thinker are presented along with appropriate lists of criteria. A logical analysis of the 12 abilities is made along 3 dimensions: logical, critical, and pragmatic. Possible research steps for the evaluation and teaching of critical thinking are suggested.—C. M. Franks.

459. Jodelet, François. Influence associative catégorielle dans l'association verbale à un couple de mots. [Categorical associative influence in verbal association to word pairs.] *Année psychol.*, 1961, 61, 341-359.—Associated response words are more frequently words of the same category as the stimuli words when the latter are drawn from the same semantic category than when they are drawn from different ones. 130 Ss reacting to 96 pairs confirm the hypothesis.—G. Rubin-Rabson.

460. National Physical Laboratory. Mechanization of thought processes. (2 vols.) London, England: Her Majesty's Stationery Office, 1959. 978 p. \$9.30. (2 vols.)—A symposium (No. 10) held at the National Physical Laboratory, November 24-27, 1958. A total of 32 papers and a number of lecture-demonstrations were presented. The material was organized in terms of the following sessions: general principles, automatic programming, mechanical language translation, speech recognition, learning in machines, implications for biology, and implications for industry.—M. J. Wayner, Jr.

461. North, George Everett. (U. Texas) Stereotypy and the role repertory test. *Dissert. Abstr.*, 1961, 21(12), 3855-3856.—Abstract.

462. Osgood, Charles E. (U. Illinois) Studies on the generality of affective meaning systems. *Amer. Psychologist*, 1962, 17, 10-28.—In connection

with work on the theory and measurement of meaning, a reasonably stable and reproducible set of dimensions within which meaningful judgments are made has been developed, and "efforts have been devoted to testing the generality of this semantic system." Major sections are: Learning Theory and Measurement Models, Generality Across People, Speculations on the "Why" of Generality Across People, Generality Across Concepts, Speculations on the "Why" of Concept/Scale Interaction. (3 fig., 13 tables, 27 ref.)—S. J. Lachman.

463. Sartre, Jean-Paul. Imagination: A psychological critique. (Trans. by F. Williams) Ann Arbor, Mich.: Univer. Michigan Press, 1962. xv, 162 p. \$3.95.—Objects exist in themselves; consciousness exists for itself. The problem arises when an image, existing for itself, is considered as an object. The question, "How can the existence of images be reconciled with the requirements of synthesis," contains the assumption of image as object. Then it is too late to consult experience. There are chapters on "Principal Metaphysical Systems," "Associationism," "Bergson," "Bergsonism," "Würzburg School," "The Classical Postulate," "Contradictory Consequences of the Classical Postulate," and "Phenomenology of Husserl."—R. S. Harper.

464. Vygotsky, Lev S. Thought and language. New York: Wiley, 1962. xxi, 168 p. \$4.95.—A translation by Hanfmann and Vakor (with annotations) of the original Russian book published in 1934. The book, consisting of a combination of originally separate essays, begins by outlining the author's approach to the problem of the interrelation of thought and language. This involves "semantic analysis—the study of the development, the functioning, and the structure of this unit, which contains thought and speech interrelated." After presenting critiques of Piaget and William Stern's theories of language development, the author presents his own views on the development of language and his general theoretical views. In addition, he presents empirical studies of concept formation and conceptual development in children. His experimental method of studying concept formation consists of the Vygotsky type block procedure.—H. Pick.

465. White, Leslie A. (U. Michigan) Symbolizing: A kind of behavior. *J. Psychol.*, 1962, 53(2), 311-317.—Symbolizing is a kind of behavior; only Homo sapiens is capable of it. It consists of originating and bestowing meanings, freely and arbitrarily, upon things (objects) and events (acts), and of comprehending such meanings. These meanings cannot be grasped and appreciated with the senses. Holy water, fetishes, rituals, and articulate speech are examples of products of symbolizing. All cultures and human behavior depend upon symbolizing. Symbolizing is to be preferred to symbolizing to designate this kind of behavior because the latter word has another, fundamentally different meaning.—Author abstract.

Problem Solving

466. Duncan, C. P. (Northwestern U.) Probability vs. latency of solution of an insight problem. *Psychol. Rep.*, 1962, 10(1), 119-121.—From a study in which 528 men and 560 women attempted solution of the Maier 2-string problem, probability of solution was found to be a roughly linear function

of log time of solution, "although a better fit could have been obtained with a more complex function. To the extent that the functions are linear, they are similar to log probability functions reported by others for anagram solving."—*B. J. House.*

467. Feather, N. T. (U. Michigan) The relationship of persistence at a task to expectation of success and achievement related motives. *J. abnorm. soc. Psychol.*, 1961, 63(3), 552-561.—This investigation examines the effects of S's motivation to achieve success or avoid failure (measured from TAT), his perception of the degree of difficulty of the task, and his probability of success upon continued attempts (persistence) to solve a given problem. Substantiating hypotheses derived from Atkinson's theory (1957, 1958), the results indicated that persistence occurs when motivation to achieve and anticipation of success are high, or when motivation to avoid failure and anticipation of failure are high.—*G. Frank.*

468. Gagné, Robert M., & Smith, Ernest C., Jr. (Princeton U.) A study of the effects of verbalization on problem solving. *J. exp. Psychol.*, 1962, 63(1), 12-18.—"A study was conducted to determine the effects of (a) requiring Ss to verbalize during practice, and (b) instructions to find a general principle to be stated verbally, on problem solving performance. The three-circle task described by Ewert and Lambert (1932) was used. The Ss were 28 ninth and tenth grade boys. . . . The results appear to indicate that requiring Ss to verbalize during practice has the effect of making them think of new reasons for their moves, and thus facilitates both the discovery of general principles and their employment in solving successive problems."—*J. Arbit.*

469. Glucksberg, Sam. (New York U.) The influence of strength of drive on functional fixedness and perceptual recognition. *J. exp. Psychol.*, 1962, 63(1), 36-41.—"A problem solving task and a perceptual recognition task were represented in S-R terms. Predictions derived from neobehavioristic drive theory were then tested in each situation. Each task was presented under one of two drive levels (high or low) and in one of two forms (dominant response correct or incorrect). High drive impaired performance in both tasks when the dominant response was incorrect. When the dominant response was correct high drive facilitated performance in the perceptual recognition task. The results in the problem solving task, although in the predicted direction, failed to achieve statistical significance. The major prediction of the theory, that there is an interaction between drive level and nature of the dominant response, was confirmed."—*J. Arbit.*

470. Gurova, L. L. (Inst. Psychology, Akad. Pedagogicheskikh Nauk, RSFSR) Myslitel'nye operatsii v protsesse osoznannogo resheniya zadach. [Cognitive operations and problem solving.] *Vop. Psikh.*, 1961, No. 6, 93-104.—To investigate conscious cognitive operations, 43 adult Ss were given geometric problems to solve. These consisted of the task of finding the shape of plane sections formed by passing planes through various solid geometric forms. The verbal reports of the Ss as to how they solved the problems were compared with the solutions found and with the steps of logical solution. Out of such data there appeared to be 2 stages to the process: the 1st is unconscious and results in an

approximate general solution and the 2nd is conscious resulting in a specific solution. The 2nd stage is characterized by "non-obvious" cognitive operations which consist of comparison of the various probable solutions with the initial conditions of the problem.—*H. Pick.*

471. Hoffman, L. R., & Maier, N. R. F. (U. Michigan) Sex differences, sex composition, and group problem solving. *J. abnorm. soc. Psychol.*, 1961, 63(2), 453-456.—Males and females solved Maier's (1952) horse trading problem while working alone or in groups. Men tended to solve the problem better individually but also to profit from group discussion. Women in mixed groups seemed better motivated to solve the problem than those in groups composed of all females.—*G. Frank.*

472. Jeffrey, W. E., & Kluppel, D. D. (U. California, Los Angeles) Mediation variables in concept formation. *Psychol. Rep.*, 1962, 10(1), 191-202.—In a series of experiments, grade school children were trained to associate color names to concrete object, abstract form, and number concepts. In 4 experiments, a variety of pretraining methods, in which appropriate labels or label-color associations or both were taught, improved overall level of performance but did not alter order of difficulty. Since providing labels for each concept failed to remove the order effect, it was inferred that differential difficulty is not the result of unequal availability of appropriate mediating responses. In a 5th experiment in which frequency of types of concepts was varied, support was found for an explanation of the order effect in terms of greater generalization within certain concept types.—*B. J. House.*

473. Johnson, Donald M. (Michigan State U.) Serial analysis of verbal analogy problems. *J. educ. Psychol.*, 1962, 53, 86-88.—A serial exposure method for separating a problem solving episode into 2 phases is applied to analogy problems constructed so that the difficulty can be attributed to either the inductive operation of the 1st phase or the deductive operation of the 2nd phase. When 25 problems of each type were solved by 60 college Ss, the time differences clearly supported this distinction. The problems were presented in 3 formats named, according to the second phase: multiple choice, initial letters, and production. In respect to time of the 2nd phase, initial letters resembled multiple choice, negating the hope that this format required a production process.—*Journal abstract.*

474. Karn, Harry W., & Gregg, Lee W. (Carnegie Inst. Technology) Supplementary report: Effects of instructions on the perception of multiple targets. *J. exp. Psychol.*, 1961, 62(5), 533-534.—In a previously reported perceptual learning study, learning proceeded slowly and the question of the facilitative effect of inducing a cognitive, problem solving set through various types of instruction was raised. In the present study, although instructions lowered the overall magnitude of errors, rate of error reduction was essentially constant. The importance of the perceptual process over the rational, information transmitting process is emphasized.—*J. Arbit.*

475. Luchins, Abraham S., & Luchins, Edith H. (U. Miami) The effect of the degree of freedom of choice on learning and perception.

J. soc. Psychol., 1962, 56, 187-205.—Ss who retraced paths of others, in checkerboard mazes, took more time to get to the goal and recalled fewer of the pictures that were on the mazes' squares than those whose paths they were tracing. Speed conditions produced more rapid responses, more errors, less variety of solutions, and less recall of pictures. Order of presentation affected the results. The results were discussed in terms of the goal gradient hypothesis, serial effects, Einstellung effects, and personal values as determinants of perception, and further research. The study suggests that what is learned when one imitates a solution is different from what is learned when one initiates a solution. Implications for education, social learning, and psychotherapy were considered.—*Author abstract.*

476. Sokolov, A. N. (Inst. Psychology, Akad. Pedagogicheskikh Nauk Moscow, USSR) *Graficheskoe sopostavlenie logicheskii predpolozhennogo i fakticheskogo khoda resheniya zadach.* [Graphical comparison of the logically predicted and actual course of solution of problems.] *Vop. Psikholog.*, 1961, No. 6, 77-92.—A method for presenting graphically the solution of any problem for which there is a logical algorithm. The algorithm solution is represented on a graph on which the ordinate represents the number of the step, the abscissa represents the number of the steps toward solution. Thus the algorithm solution would be a straight line with a slope of 45°. From the protocols of Ss asked to think aloud or record the steps of their thinking, the steps that they make are rated with respect to how many steps toward solution each step is. Thus the order of the step and its rating from a number couple (x,y) which defines the coordinate of each step. These steps are then represented graphically along with the algorithm solution. Various characteristics of the solution can be picked off the graph easily, e.g., which steps are omitted, how many steps are taken, etc. Examples of application to 3 physics problems are given.—*H. Pick.*

477. Tikhomirov, O. K. (Moscow State U.) *Reshenie myslitel'nykh zadach kak veroyatnostnyi protsess.* [Solution of cognitive tasks as a probabilistic process.] *Vop. Psikholog.*, 1961, No. 5, 63-76.—An analysis of conjunctive concept attainment is presented which follows closely that outlined by Bruner, Goodnow, and Austin in *A Study of Thinking* (see 31: 582). The analysis is generalized to cases where the various concept classes are assigned different probabilities of being correct. The strategy for minimum trial solution, when the entire array of instances is known to a person, is worked out with the help of Bayes' theorem. The actual behavior of the S is then compared to this ideal strategy. Departures from the ideal are attributed to the facts that Ss do not select choices which eliminate the largest number of hypotheses, particularly after having chosen a negative instance, and that they occasionally make wild guesses instead of systematically eliminating all alternative hypotheses.—*H. Pick.*

478. Tuckman, Jacob, & Lorge, Irving. (Dept. Public Health, Philadelphia) *Individual ability as a determinant of group superiority.* *Hum. Relat.*, 1962, 15(1), 45-51.—420 Air Force Reserve Officer Training Corps cadets were divided into 70 groups to solve a mined road problem. These control groups were compared to 70 individuals in their solution of

the problem, and again to the same individuals re-assembled into groups of 5 to re-solve the problem. The results indicate that groups are superior to individuals, not so much on account of the greater effectiveness of groups in solving problems, but rather on account of the greater probability of getting a good solution from a group of 5 than from any one individual.—*W. W. Meissner.*

Concepts

479. Alberoni, Francesco. (U. Cattolico Sacro Cuore, Milan) *Contribution to the study of subjective probability. Part I.* *J. gen. Psychol.*, 1962, 66(2), 241-264.—A "study of the mental processes by means of which the subject arrives at the idea of probability and the fundamental operations used to calculate it." Groups of university students were questioned about their expectations in 15 different probability situations. Their replies are discussed. (16 ref.)—*E. Y. Beeman.*

480. Alberoni, Francesco *Contribution to the study of subjective probability: Prediction. Part II.* *J. gen. Psychol.*, 1962, 66(2), 265-285.—A "study of the intellectual processes on which probabilistic prediction depend." In 8 experiments Ss were questioned about their expectations in probabilistic situations involving red and blue beads. Their reactions are discussed, and the types of reasoning being used are inferred.—*E. Y. Beeman.*

481. Davis, Keith G., & Hess, Harrie F. (U. Colorado) *The effectiveness of concepts at various levels of awareness.* *J. exp. Psychol.*, 1962, 63(1), 62-67.—"This experiment was a replication of the oft-cited study by Rees and Israel (1935) which reported that 6 out of 10 (60%) of experimental Ss developed and used highly effective concepts that were below the level of awareness. In the replication more Ss were used than in the original experiment, and a more systematic method of assessing awareness was employed. None of the Ss in the replication study developed efficient concepts at a level below awareness. Instead a close relation between awareness and anagram solving efficiency was noted, contrary to one of the main implications of the Rees and Israel study."—*J. Arbib.*

482. DiVesta, Francis J. (Syracuse U.) *Contrast effects in the verbal conditioning of meaning.* *J. exp. Psychol.*, 1961, 62(6), 536-544.—College students learned one concept-attitude based on words strongly representing the evaluative or potency dimension of meaning and another concept-attitude based on words having neutral meanings on the respective dimension being manipulated. Concept-attitudes were shown to develop specifically to the meaning dimension involved in the words used in conditioning. Also, concept-attitudes learned to neutral meanings, although conditioned to exactly the same words, were found to be rated in direct opposition to the respective critical concept. A mediation hypothesis, anchor effects, and the "boomerang" effect in the development of attitudes were employed in discussing the results.—*J. Arbib.*

483. Feigenbaum, Edward A. (U. California, Berkeley) *An experimental course in simulation of cognitive processes.* *Behav. Sci.*, 1962, 7(2), 244-245.—A graduate seminar in this area is described, and several student reports are appended.

The titles of the reports are: "A Simulation Program for Concept Attainment by Conservative Focusing"; "A Concept Attainment Program That Simulates a Simultaneous-Scanning Strategy"; "A Nerve Net Simulation"; "An IPL Program for Formal Integration Using Tables"; and "RECOG, A Computer Program for the Automatic Scanning of Bubble Chamber Photographs."—*J. Arbit.*

484. Gagné, Robert M., & Brown, Larry T. (Princeton U.) Some factors in the programming of conceptual learning. *J. exp. Psychol.*, 1961, 62(4), 313-321.—33 boys in Grades 9 and 10 were formed into 3 groups and learned materials in 1 of 3 ways: by rule and example, by guided discovery, and by the S's own discovery. Best performance was found with guided discovery, worst for rule and example, and intermediate for self-discovery. Discussion emphasizes "what is learned" by each method rather than the importance of "how it is learned."—*J. Arbit.*

485. Hunt, Earl B. (Yale U.) Memory effects in concept learning. *J. exp. Psychol.*, 1961, 62(6), 598-604.—"The utilization of information transmitted by a particular instance was investigated as a function of the position of the instance in a series of instances used to define a concept. Utilization of information was determined by observing S's action on a categorization task. An interference effect was found for instances intervening between the information transmitting instance and the beginning of the test."—*J. Arbit.*

486. Mayzner, M. S., & Tresselt, M. E. (U. Southern California) Verbal concept attainment: A function of the number and strength of positive instances presented. *J. Psychol.*, 1962, 53(2), 469-474.—"The present study examined the effect of the number and strength of positive instances presented on verbal concept attainment. The results, predicted on the basis of an S-R mediational model, showed a significant and systematic increase in the number of positive instances required to attain the correct concept as the response strength of the positive instances to evoke the correct concept decreased."—*Author abstract.*

487. Sagotovskii, V. N. Chuvstvennye osnovy poniatii. [Sensory bases of the concept.] *Vop. Fil.*, 1962, 16(1), 123-133.—The author discusses 2 related questions: (a) "how is a concept connected with its object" and (b) "in what way does a concept develop its general meaning"? The author feels that "apriorism" can be avoided only if the "roots of all elements of conceptual thinking be found in the sensory patterned reflection of reality" in accordance with Lenin's theory of reflection of reality in man's consciousness.—*I. D. London.*

488. Shevarev, P. A. (Inst. Psychology, Akad. Pedagogicheskikh Nauk RSFSR, Moscow, USSR) Abstragirovanie naglyadno dannykh sbolstv i osobennostei predmetov. [Abstraction of visually given properties and qualities of objects.] *Vop. Psikh.*, 1961, No. 6, 63-76.—An analysis of the meaning of the term abstraction particularly as it is involved in perception. Abstraction is considered to be a process of "mental discernment" of properties, position, numerosity, or relations of an object or group of objects. In order to determine what features of an object are discerned it is often necessary

to present a number of objects differing in various ways and noting which objects evoke similar and different responses. Abstraction includes discernment of properties peculiar to an individual object as well as class properties. As far as the process of abstraction is concerned the discernment of essential or unessential qualities represents no difference. But the discernment of essential and nonessential properties becomes significant in practical training.—*H. Pick.*

489. Smith, Raymond G. (Indiana U.) A semantic differential for speech correction concepts. *Speech Monogr.*, 1962, 29, 32-37.—An instrument involving 10 area-related concepts and 30 scales was developed on 100 Ss. Factor analyses by Varimax rotation were performed by ILLIAC. 4 factors appeared to be identifiable: Interestingness, measured by such scales as boring-interesting and colorless-colorful; Pleasantness, beautiful-ugly and pleasing-annoying; Honesty, honest-dishonest and true-false; and Difficulty, measured by difficult-easy and slow-fast scales. Further uses of the instrument are discussed.—*D. Lebo.*

DECISION & INFORMATION THEORY

490. Arnoult, Malcolm D., & Price, Charles W. (Texas Christian U.) Pattern matching in the presence of visual noise. *J. exp. Psychol.*, 1961, 62, 372-376.—4 patterns of dots were constructed and a number of test patterns varying from the basic design in terms of adding or subtracting dots (noise level) were constructed for each prototype pattern. Ss were college students whose task was to determine which of the prototype patterns each test pattern most resembled. As distortion level increased, the information transmitted decreased and errors increased.—*J. Arbit.*

491. Back, Kurt W. (Duke U.) Decisions under uncertainty: Rational, irrational, and non-rational. *Amer. behav. Scientist*, 1961, 6, 14-19.—2 models of decision-making have dominated thought and research on decisions in the behavioral sciences: rational models, of which game theory and statistical decision theory are examples, and irrational models, which derive choices among alternatives from psychodynamic factors or preferences of the person. The author analyzes the assumptions of each of these general classes of models and then suggests that an additional model, which he calls nonrational, is needed to account for many aspects of decision-making. Nonrational decisions are unique decisions occurring under conditions of either extreme or trivial importance in which the actor has insufficient knowledge of the probabilities associated with various alternatives. An important aspect of nonrational decisions is that the voluntary commitment to an alternative creates something new not contingent upon past internal and external factors.—*K. E. Davis.*

492. Brainard, Robert W., Irby, Thomas S., Fitts, Paul M., & Alluisi, Earl A. (Ohio State U.) Some variables influencing the rate of gain of information. *J. exp. Psychol.*, 1962, 63(2), 105-110.—Investigated the effects on information processing of (a) the use of self-paced serial reactions vs. discrete reactions, (b) the use of different types of stimuli and responses, and (c) the use of 3 levels

of stimulus uncertainty. Reaction time was an increasing linear function of the average amount of information transmitted. The self-paced and discrete tasks gave very similar results. The findings are interpreted as indicating the importance of overlearning in determining S-R compatibility effects. Also, S's familiarity in dealing with specific subsets drawn from familiar alphabets may affect his information-handling rates when restricted subsets of stimuli and responses are used.—*J. Arbit.*

493. Brichcín, M. (Charles U., Prague) *Rozbor problematiky volního úsilí*. [Analysis of the problems of volitional effort.] *Ceskoslov. Psychol.*, 1961, 5, 340-354.—Author's conclusions drawn subsequent to discussion of 8 psychologists about his original paper "Problems of Volitional Effort (see 36: 3CC21B). Volitional effort is a specific case of volitional regulation of activity. By its means man is capable of suppressing even very strong biological needs and, despite considerable obstacles, he can reach the aim decided upon in accordance with relatively weak but rationally well-founded incentives. It is a complex of cerebral processes, an inseparable component of which is the feeling of effort; the chief part of this complex is the dominant focus of excitation (Uchomski). The cerebral cortex dominant probably summarizes mainly the proprioceptive impulses. The leading role in the nervous mechanism of volitional effort belongs to the 2nd signal processes. Volitional effort is a special case of the adaptation and activation processes which prepare the whole organism for optimal control of the coming load. (44 ref., Russian & English summaries)—*V. Bricháček*.

494. Brillouin, Léon. *Science and information theory*. (2nd ed.) New York: Academic, 1962. xvii, 351 p. \$9.00.—The 2nd edition adds material on the role of errors in scientific observation and a critical discussion of determinism from the standpoint of information theory to the material of the 1st edition, which applied information theory to a great number of problems of physics, including: the analysis of signals; thermodynamics; Brownian movement; thermal agitation in electronic tubes, rectifiers, etc.; entropy; Maxwell's demon; Szilard's well-informed heat engine; observations and error; communication; and computing. The new material on determinism leads to Brillouin's "matter of fact" point of view that strict determinism is impossible in scientific prediction because the high cost at some point makes increasing accuracy unattainable. The limit of accuracy is a practical rather than an inevitable limitation in the logical sense. The limitations can be formulated in precise ways by quantum conditions and information theory and should be included in the physical theory.—*D. A. Grant*.

495. Brody, Nathan. (U. Michigan) *Demand for certainty, motivation, and the decision process*. *Dissert. Abstr.*, 1961, 21(12), 3842.—*Abstract*.

496. Bruner, Jerome S. (Harvard U.) *Quelques observations sur le choix*. [Observations concerning choice.] *J. Psychol. norm. pathol.*, 1961, 58(3), 271-289.—To the extent to which an individual's behavior is regulated by reward and punishment of each response, the prediction can be made from external conditions to internal processes. The behavior of an organism which has evolved a "strategy" is predictable in the opposite direction.

The author suggests that the latter condition obtains in most instances of complex behavior.—*M. L. Simmel*.

497. Campbell, Richard John. (Ohio State U.) *Team composition and group decision-making in a collective bargaining situation*. *Dissert. Abstr.*, 1961, 21(11), 3939-3940.—*Abstract*.

498. Dale, H. C. A. *On choosing between bets*. *Quart. J. exp. Psychol.*, 1961, 14(1), 49-51.

499. Deutsch, Morton. *The face of bargaining*. *Operat. Res.*, 1961, 9, 886-897.—A 2-person bargaining game was investigated experimentally. It was found that (a) when threat is available to both players, rather than one, agreement is most difficult; (b) payoff is maximized under conditions of no threat for either person; (c) permissive communication does not produce more payoff than when no communication is present; and (d) compulsory communication produces an improvement in payoff for the unilateral threat condition only. The findings were discussed with respect to the balance of cooperative and competitive motivational forces present and the players' need to retain "face" in interpersonal encounters.—*M. R. Marks*.

500. Erlick, Dwight E. (Wright-Patterson AFB) *Perception of the most frequent category of a random series as a function of the number of categories*. *J. exp. Psychol.*, 1962, 63(2), 115-118.—"The main variables of concern were: the relationship between information transmitted (T) and (a) the frequency difference between categories (ΔF), and (b) the information input (H). The different categories were 2, 4, 8, or 12 (H in bits = 1, 2, 3, and 3.6, respectively). Within each H condition a basic frequency of 20 was used for all except one category, which had an increased frequency of one of five values. Categories were presented randomly at the rate of four per sec. The Ss were instructed to indicate the category which appeared most frequently. The results indicate that approximately the same linear relationship exists between T and ΔF for all H conditions with $T = .0113 \Delta F - .1342$. The relationship between T and H indicates a slight decrease in T as H increases."—*J. Arbit.*

501. Gardner, R. Allen, & Forsythe, John B. (Wellesley Coll.) *Supplementary report: Two-choice decision behavior with many alternative events*. *J. exp. Psychol.*, 1961, 63(6), 631.—With multiple-choice versions of the probability learning experiment it has been shown that P (A), the relative frequency of A choices where A is the most frequent alternative, is an increasing function of the number of alternatives. "The present study was an attempt to reproduce this result by varying the number of alternative events in the series, A, B, C, . . . , N, while restricting S to two choices, A or not-A." There was no detectable effect of the number of alternative events. However, the outcome was distinctly different from that obtained when both the number of choices and alternative events were varied together.—*J. Arbit.*

502. Garner, Wendell R. (Johns Hopkins U.) *Uncertainty and structure as psychological concepts*. New York: Wiley, 1962. ix, 369 p. \$8.95.—A mathematical basis stemming from information

theory has been used "to develop ideas about and an understanding of some psychological problems." The 1st 4 chapters discuss uncertainty in reference to perceptual discrimination and information transmission. Chapter 5 deals with "the partitioning of structure and meaning." Pattern perception, language redundancy, other sequential behavior, and concept formation are considered in Chapters 6 through 10. Chapter 11 is a "Final Commentary."—*E. Y. Beeman.*

503. **Graham, Frances K., Ernhart, Clarie B., Thurston, Don, & Craft, Marguerite.** (U. Wisconsin School Medicine) **Development three years after perinatal anoxia and other potentially damaging newborn experiences.** *Psychol. Monogr.*, 1962, 76(3, Whole No. 522), 53 p.—The question was investigated of whether or not permanent impairment and/or a "continuum of reproductive casualty" follow perinatal anoxia or other trauma associated with birth. The study of 355 children shortly after birth, with a follow-up at 3 years of age, included neurological examination; anthropometric, intelligence, personality, and perceptual-motor measurements; and concept formation. Among the many findings were: (a) Anoxic Ss were poorer than controls on all cognitive function tests including Form L of the Stanford-Binet, a vocabulary test, and a concepts test. Impairment was found greatest in conceptual ability. (b) The blood-oxygenation of the newborn did not vary consistently with performance at age 3. (c) Prognosis worsened as the severity or the number of perinatal complications increased. The investigators concluded that anoxia does not appear to have an all-or-none effect.—*M. A. Seidenfeld.*

504. **Daming, D. R. J.** (Cambridge U.) **A statistical test of a prediction from information theory in a card-sorting situation.** *Quart. J. exp. Psychol.*, 1962, 14(1), 38-48.—Previous work with cards left the joint effects of varying entropy and discriminability on choice-reaction times somewhat in doubt. A card-sorting situation is here constructed in which entropy and discriminability can be varied independently. 2 experiments are described with naive Ss and 2 different treatments of the practice effect. The effect of varying entropy with discriminability held constant is shown to be significantly nonlinear, contrary to the prediction from information theory. Finally, a statistical model is proposed which shows at least qualitative agreement with the results of these experiments.—*Journal abstract.*

505. **Leont'ev, A. N., & Krinchik, E. P.** (Moscow State U.) **O primeneni teorii informatsii u konkretno-psikhologicheskikh issledovaniyakh.** [On the application of information theory to concrete psychological investigations.] *Vop. Psikh.*, 1961, No. 5, 25-46.—A review, mainly of American and British studies, relating the amount of information present in a sequence of stimuli to the reaction time to the various stimuli. The successes of an information analysis in predicting reaction time are described and limitations of such an analysis pointed out; e.g., the fact that an information analysis based solely on number of alternatives ignores the discriminability of the stimuli and the value of the possible responses. A brief description is presented of current investigations in the authors' laboratory in which reaction

time to separate signals differing in probability of appearance is under study.—*H. Pick.*

506. **Littig, L. W.** (U. Buffalo) **Effects of skill and chance orientations on probability preferences.** *Psychol. Rep.*, 1962, 10(1), 67-70.—10 probability-variance combinations were presented to 60 college students in the form of 45 paired comparisons. The S chose from each pair his preferred combination prior to play on a pinball machine with probabilities determined by E. Variance was controlled by size of wagers and prizes. Significant effects were preferences for higher winning probabilities, higher variance, and an interaction such that higher probability of winning is preferred when stakes are higher. No differences were found between Ss instructed that skill could influence results and uninstructed Ss.—*B. J. House.*

507. **Luce, R. Duncan.** (U. Pennsylvania) **An observable property equivalent to a choice model for discrimination experiments.** *Psychometrika*, 1962, 27(2), 163-167.—The choice model considered by Luce in an earlier work is stated in terms of unobservable parameters. In this paper a consequence of the model, involving only observables, is shown to be equivalent to the model.—*Journal abstract.*

508. **Luce, R. Duncan, & Shipley, Elizabeth F.** (U. Pennsylvania) **Preference probability between gambles as a step function of event probability.** *J. exp. Psychol.*, 1962, 63(1), 42-49.—College students chose repeatedly between pairs of gambles. Payoff on each trial was determined by the particular choice together with the outcome of a chance event which was completely independent of the choice. The mathematically derived prediction was tested that when certain inequalities are satisfied by the payoffs, S's choice probability is a step function of the event probability. It was tentatively concluded that the data support the step function hypothesis more strongly than an ogival one, and that indirect confirmation is given to the assumption underlying the prediction.—*J. Arbit.*

509. **Myers, Jerome L., Reilly, Raymond E., & Taub, Harvey A.** (U. Massachusetts) **Differential cost, gain, and relative frequency of reward in a sequential choice situation.** *J. exp. Psychol.*, 1961, 62(4), 357-360.—"Gain, cost, and frequency ratios were manipulated for two events in a sequential choice situation with monetary incentives. Percentage prediction of the events was strongly influenced by these variables and by their interaction. The relation between percentage prediction of an event and the expected value associated with it was discussed."—*J. Arbit.*

510. **Olmsted, Charlotte.** (Stanford U.) **Heads I win—tails you lose.** New York: Macmillan, 1962. 277 p. \$4.50.—A nontechnical examination of "games and the people who play them." The book discusses a wide range of organized and unorganized games of chance in various historical, cultural, and sub-cultural contexts. Attention is given to the "symbolism" of the specific games and the "motivation" of the gambler.—*R. E. Schutz.*

511. **Robertson, Joseph Gray, Jr.** (Pennsylvania State U.) **Decision making in two-person two-choice zero-sum games under different incentive conditions.** *Dissert. Abstr.*, 1961, 22(1), 337.—*Abstract.*

512. Roby, Thornton B. (Tufts U.) **Utility and futurity.** *Behav. Sci.*, 1962, 7(2), 194-210.—"This article is concerned with choice or decision situations in which the consequences of a given choice extend well beyond the immediate choice referents. This is taken to be typical of real-life decisions as opposed to most laboratory studies in which a choice response leads to a once-and-for-all 'payoff.' We shall propose a taxonomy for such extended consequence conditions and describe mathematical techniques for studying special, but important, cases. The framework is based on the assumed ability of the choosing organism to react to consistent probabilistic relationships in his environment."—*J. Arbit.*

513. Schoeffler, M. S. (Bell Telephone Lab.) **Response strength versus all-or-none interpretation of response occurrence.** *Psychol. Rep.*, 1962, 10(1), 255-258.—"Data from a two-choice discrimination task [using 234 students] were compared with predictions from an incremental response strength theory and with predictions from an all-or-none theory and indicate that the latter provides relatively good predictions while the former can be rejected confidently."—*B. J. House.*

514. Schwartz, Noel F. (Behavioral Sciences Lab.) **A game theory apparatus for psychological research.** *USAF ASD tech. Rep.*, 1961, No. 61-239. 6 p.—This report describes an electrical apparatus designed to facilitate psychological research in games of strategy for game matrices no larger than 3×3 . The description includes an operational procedure and an explanation of the circuitry with an accompanying photograph of the equipment and simplified schematic. The apparatus provides push-button selection of matrix columns by 1 S and rows by his opponent who may be another S or the E. These selections determine numerical payoff values of varying desirability for the players. This conflict situation allows the psychologist to study various aspects of human behavior, such as strategy formation.—*USAF ASD.*

515. Shinkman, Paul G. (IBM Research Cent., Yorktown Heights, N. Y.) **Perception of stimuli of varying dimensionality.** *J. exp. Psychol.*, 1961, 62(5), 626-627.—A study by Anderson and Fitts (see 33: 9544) found that more information was transmitted by numerals superimposed on color patches than by either numeral or color patches alone when these stimuli were presented for .1 sec. to Ss who had been instructed to write down what they saw. The present study attempted to replicate the previous work and to study the effect of differences in visual angle in producing the effect found. The results show that the Anderson and Fitts data are not only reproducible, but are also stable under minor procedural alterations, including changes in brightness level.—*J. Arbit.*

516. Shipley, Elizabeth F. (U. Pennsylvania) **Detection and recognition with uncertainty.** *Disser. Abstr.*, 1961, 21(12), 3847.—*Abstract.*

517. Teichner, W. H. (U. Massachusetts) **Psychophysical concepts of probability.** *Psychol. Rep.*, 1962, 10(1), 3-9.—32 undergraduates were required to guess which of 16 lights arranged in a 4×4 matrix would flash on each trial. Marginal probabilities ranged from .05 to .60. Subjective

probability, confidence, and value were measured by cell frequency of guesses, a rating scale, and size of wager, respectively. All 3 scales overestimated low and underestimated high probabilities, but were judged sufficiently independent to warrant consideration of 3 different processes.—*B. J. House.*

518. Yaryan, R. B., & Festinger, L. (Stanford U.) **Preparatory action and belief in the probable occurrence of future events.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 603-606.—This study was conducted to determine the influence of behaving as if an event will occur on the belief that it will occur. It was hypothesized that such behavior should increase the belief in the likelihood of the event occurring. Ss (volunteer female high school students) were told that $\frac{1}{2}$ the Ss who volunteered would have to take an exam, but not whether they were in that group (50% probability). All Ss were required to do some preparatory study; $\frac{1}{2}$ were told to memorize the data in preparation for the exam, $\frac{1}{2}$ to only acquaint themselves casually with it. Ss were then asked their assessment of the probability that they were included in the group to be tested. A larger percentage of the group that had to make the greatest effort (memorize vs. acquaint) believed they would have to take the test.—*G. Frank.*

PHYSIOLOGICAL PSYCHOLOGY

519. Cole, Kenneth, & Kishimoto, Uichiro. **Platinized silver chloride electrode.** *Science*, 1962, 136(3514), 381-382.—A hybrid electrode made by platinizing silver-silver chloride has been found to combine the stable potential and low direct-current resistance properties of a silver-silver chloride electrode with the low high-frequency impedance characteristic of a platinized platinum electrode.—*Journal abstract.*

520. Davis, R. C. **Experiment and theory in physiological psychology.** In Sigmund Koch (Ed.), *Psychology: A study of a science*. Vol. 4 (see 37: 93). Pp. 242-279.—What physiological psychology is and what types of work it includes are discussed, 4 samples of experimental studies from the 1940's and '50's are described and summarized. 5 prominent theories are examined. Rashevsky's mathematical biophysics, McCulloch's binary digital theory, pattern theory, Hebb's theory, and Pribram's synthesis. The difficulties involved when theory and experiment work together are discussed. (37 ref.)—*E. Y. Beeman.*

521. Diamond, I. T., & Chow, K. L. (Duke U.) **Biological psychology.** In Sigmund Koch (Ed.), *Psychology: A study of a science*. Vol. 4. (see 37: 93). Pp. 158-241.—"In the first section, it was argued that species differences reveal behavior traits which organisms possess as they possess organs." The 2nd section traces the evolution of the cortex and thalamus. Sections 3 and 4 review and discuss work with ablations and electrical recording. Section 5 proposes there is room in psychology for neurologizing and analysis at the organ level. (176 ref.)—*E. Y. Beeman.*

logical experimentation with dogs. *J. exp. Anal. Behav.*, 1962, 5(2), 209-211.—A detailed description of a restraining device used with beagle dogs.—*J. Arbit.*

523. Landahl, H. D. (U. Chicago) **Mathematical theory of the central nervous system.** *Ann. N. Y. Acad. Sci.*, 1962, 96, 1056-1070.—An attempt to treat psychological problems with neural net models is presented. A neural element acting once after each input impulse yields a "discrete" model. One whose frequency depends on average input frequency yields a "continuous" model. A number of transient effects such as the perception of movement and certain color effects can be accounted for by a simple model. Certain aspects of discrimination and conditioning (including overlearning, spaced practice effects, and initial response probability) are also formulable in terms of relatively simple nets. (37 ref.)—*B. S. Aaronson.*

524. Livingston, Robert B. (National Inst. Health, Bethesda, Md.) **How man looks at his own brain: An adventure shared by psychology and neurophysiology.** In Sigmund Koch (Ed.), *Psychology: A study of a science. Vol. 4* (see 37: 93). Pp. 51-99.—The history of neurophysiology in the Western and Russian traditions is presented as well as several concepts pertinent to psychology which have been changing rapidly, and sometimes radically, in the last few years. Some research is summarized from areas of comparative and developmental neurophysiology, circulation and metabolism, neuron biophysics and physiology, physiology of the neuroglia, and the study of brain circuitry. (55 ref.)—*E. Y. Beeman.*

525. Miller, Neal E. (Yale U.) **Analytical studies of drive and reward.** *Amer. Psychologist*, 1961, 16, 739-754.—An attempt was made to analyze some of the fundamental mechanisms involved in drive and reward. Topics covered are: the effect of drive on reward and learning, brain electrolytes and thirst, and a new conception of the brain. "The brain is an active organ which exerts considerable control over its own sensory input. The brain is a device for sorting, processing, and analyzing information. The brain contains sense organs which respond to states of the internal environment, such as osmotic pressure, temperature, and many others. The brain is a gland which secretes chemical messengers, and it also responds to such messengers as well as to various types of feedback, both central and peripheral." (21 fig., 36 ref.)—*S. J. Lachman.*

526. Morrell, F. (Stanford U. School Medicine) **Electrophysiological contributions to the neural basis of learning.** *Physiol. Rev.*, 1961, 41(3), 443-494.—The recent literature on alterations in spontaneous rhythms and in evoked potentials and on the formation of temporary connections is reviewed, after which long-term mechanisms of storage are discussed. The search for such mechanisms is "likely to involve a molecular or submolecular level of organization." (359 ref.)—*C. T. Morgan.*

527. Pribram, Karl H. (Stanford U. School Medicine) **Interrelations of psychology and the neurological disciplines.** In Sigmund Koch (Ed.), *Psychology: A study of a science. Vol. 4* (see 37: 93). Pp. 119-157.—After a discussion of "what is neuropsychology?" and its important variables, 5

experiments are summarized involving rate of lever pressing response under food deprivation, after amygdectomy, and after frontal lesions, and effects of amygdectomy in conditions of transposition and sequential discrimination. The methods of the neuro-psychologist are discussed. (51 ref.)—*E. Y. Beeman.*

528. Rashevsky, N. (Conf. Ed.) (U. Chicago) **Mathematical theories of biological phenomena.** *Ann. N. Y. Acad. Sci.*, 1962, 96, 895-1116.—Proceedings of a conference on the application of mathematical models to biology. Topics include enzyme reactions, pharmacology, respiration, circulation, mortality, cellular proliferation, electronics, the central nervous system (see 37: 523) and nerve processes, and some general papers on the application of mathematical methods to biology.—*B. S. Aaronson.*

529. Rosenblith, W. A., & Vidale, Eda B. (Massachusetts Inst. Technology) **A quantitative view of neuroelectrical events in relation to sensory communication.** In Sigmund Koch (Ed.), *Psychology: A study of a science. Vol. 4* (see 37: 93). Pp. 334-379.—Work in electrophysiology is discussed, including neural representations of time and intensity variables, localization, assessment of state variables, and responses to discrete stimuli. "... the important aspects of neural functioning seem to be represented by more or less complicated spatiotemporal patterns of neuroelectrical activity and are not merely given by absolute values of electrical changes as a function of time." (76 ref.)—*E. Y. Beeman.*

530. Rosner, Burton S. (West Haven VA Hosp.) **Psychophysics and neurophysiology.** In Sigmund Koch (Ed.), *Psychology: A study of a science. Vol. 4* (see 37: 93). Pp. 280-333.—"The first sections of this paper reviews modern neurophysiology... part 2 takes up the empirical variables of psychophysics and some general theoretical approaches to psychophysical processes. Discussion of current and possible future relationships between the two disciplines occupies the final section of this article." (107 ref.)—*E. Y. Beeman.*

531. Sniakin, P. G. **O tsentral'noy regulyatsii deyatel'nosti sensorn'ikh sistem.** [Central control over activity of sensory systems.] *Fiziol. Zh. SSSR*, 1961, 47(11), 1345-1351.

532. Spuler, H., Szekeley, E. G., & Spiegel, E. A. (Temple U. Medical Center) **Stimulation of the ventrolateral region of the thalamus: Its effect upon tremor induced by midbrain stimulation in cats.** *Arch. Neurol.*, 1962, 6, 208-219.—Lesions of the ventrolateral area of the thalamus reduce tremor and rigor in patients with Parkinsonism, while stimulation of this region results in facilitation or modification of tremor. This study analyzes the significance of stimulation effects with 78 anesthetized cats (some with combined degeneration of descending fibers of the internal capsule and of the pallidofugal fibers). (22 ref.)—*R. Gunter.*

533. von Bonin, Gerhardt. (U. Illinois, Coll. Medicine) **Brain and mind.** In Sigmund Koch (Ed.), *Psychology: A study of a science. Vol. 4* (see 37: 93). Pp. 100-118.—"... while the idea that the life of the mind and the life of the brain are correlated seems eminently reasonable and true, we cannot yet work it out in detail... To equate cor-

tical events with conscious events is certainly quite unjustified." The reticular system is a candidate for the oldest seat of consciousness and the contribution of the quadrigeminal bodies not fully understood. The anatomy of the brain places certain limits on the ways the brain can work, but an understanding of just how it does work will require many more years of study and research. (61 ref.)—E. Y. Beeman.

NEUROANATOMY & PHYSIOLOGY

534. Delov, V. E., Adamovitch, N. A., & Borgest, A. N. Vliyanie afferentnykh impul'sov s retseptorov vnutrennikh organov na bioelektricheskuyu aktivnost' kor'i limbicheskoi doli golovnogo mozga. [Relationship between cerebral cortex and hypothalamus in control of blood pressure.] *Fiziol. Zh. SSSR*, 1961, 47(9), 1083-1086.

535. Nachmansohn, David. (Columbia U.) The propagation of nerve impulses. *Yale scient. Mag.*, 1962, 36(5), 20-26.—In this paper, the mechanism of nerve impulse transmissions is summarized. In addition, the author presents a new theory of nerve conduction which greatly extends the role of acetylcholine beyond its former one of a neurohormone acting at the synapses.—*Journal abstract*.

536. Nekrasov, P. A. K fiziologii retseptorov perifericheskikh nervnykh stvolov. [Contribution to physiology of receptors of peripheral nerve trunks.] *Fiziol. Zh. SSSR*, 1961, 47(9), 1105-1113.

537. Snider, R. S., & Lee, J. C. (Northwestern U.) A stereotaxic atlas of the monkey brain (*Macaca mulatta*). Chicago, Ill.: Univer. Chicago Press, 1961. 130 p. \$12.50.—A series of 122 photomicrographs of brain sections reproduced at a magnification of 9.5 approximately labeled, and scaled for use with a stereotaxic instrument. There is an index of major structures.—C. T. Morgan.

538. Turbes, C. C., & Freeman, L. W. (Purdue U.) Morphologic findings in studies of regeneration of synapses in the mammalian spinal cord. *Neurology*, 1961, 11(11), 970-976.—Since little evidence was available concerning functional or morphological reestablishment of synaptic connections in mammals, the neurilemmal portion of the dorsal roots was inserted into the spinal cord to the depths of the gray columns in 27 female dogs. The authors summarized that "regenerating peridendritic and perisomatic nerve fibers and synaptic endings were found on neurons in regions adjacent to the inserted dorsal root. Regenerating nerve root fibers with neurilemmal cells, fibroblasts, and connective tissue were found growing around blood vessels and between ependymal cells in these areas. Preliminary physiologic studies indicate reestablishment of functional synaptic connections determined by stimulating the regenerating dorsal root and observing muscle contraction."—R. Gunter.

LESIONS & BEHAVIOR

539. Adey, W. R., Walter, D. O., & Lindsley, D. B. (U. California, Los Angeles) Subthalamic lesions: Effects on learned behavior and correlated hippocampal and subcortical slow-wave activity. *Arch. Neurol.*, 1962, 6, 194-206.—The study investigates the rhythmic slow waves as found during discrimination learning in hippocampus and sub-

thalamus, rostral midbrain, reticular formation, and sensory projection area of the cortex. The Ss were 5 implanted cats (2 of which died). The results confirmed previous findings the "6-cycles-per-second activity appeared in hippocampal structures during the approach performance and was accompanied by similar bursts of slow waves in diencephalic areas, including subthalamus and midbrain reticular substance, and in sensorimotor area of the cerebral cortex." Bilateral electrocoagulation resulted in performance changes which were accompanied by loss of normal slow wave patterns in hippocampus and extrahippocampal structures. Recovery of normal discriminatory functions was accompanied by return of normal wave patterns. "Even when discrimination was most gravely impaired, there was no interference with classical conditioned motor responses in the test situation." The subthalamic lesions resulted in awareness loss of contralateral $\frac{1}{2}$ of environment. (21 ref.)—R. Gunter.

540. Diamond, Irving T., Goldberg, Jay M., & Neff, William D. (U. Chicago) Tonal discrimination after ablation of auditory cortex. *J. Neurophysiol.*, 1962, 25, 223-235.—"After bilateral removal of auditory areas AI, AII and Ep, cats were unable to relearn a tonal discrimination in which the neutral signal consisted of tones of two frequencies (800 and 1000 c./sec.) and the avoidance signal of tones of only one of the frequencies (800 c./sec.). The discrimination could be relearned after ablation of most of AI together with all of AII and Ep provided that a small patch of AI and its thalamic connections were spared. The results are discussed in terms of a neural model of the activity of subcortical auditory centers after auditory cortex ablation."—G. Westheimer.

541. Inglis, James. (Queen's U., Canada) Dichotic stimulation, temporal-lobe damage, and the perception and storage of auditory stimuli: A note on Kimura's findings. *Canad. J. Psychol.*, 1962, 16(1), 11-17.—A reinterpretation of Kimura's data (see 36: 4JG56K) on the recognition of digits with dichotic stimulation, following temporal lobectomy to remove epileptogenic foci. A hypothesis is proposed that the impairment is one of auditory storage rather than of perceptual function. Modifications of Kimura's data analysis and possible additional research are discussed.—R. S. Davidson.

542. Isaacson, Robert L., Douglas, Robert J., & Moore, R. Y. (U. Michigan) The effect of radical hippocampal ablation on acquisition of avoidance response. *J. comp. physiol. Psychol.*, 1961, 54, 625-628.—Rats with hippocampal lesions were compared to normal rats and rats with cortical lesions in a shuttle-box situation. Animals were trained for 5 days, with extinction trials preceding shock trials on Days 2 to 5. Operates reached the learning criterion most rapidly; they showed lower latencies in extinction as well as on learning trials.—W. A. Wilson Jr.

543. Kimura, Doreen. (Montreal Neurological Inst., Canada) Perceptual and memory functions of the left temporal lobe: A reply to Dr. Inglis. *Canad. J. Psychol.*, 1962, 16(1), 18-22.—In reply, "Inglis' [see 37: 541] application of the Broadbent model to my data is not a convincing alternative to a perceptual interpretation. Moreover, the feasibility of separating short-term neural events into perceptual and storage systems along the lines suggested by

Broadbent has yet to be demonstrated."—R. S. Davidson.

544. Kruper, Donald C., Patton, Robert A., & Koskoff, Yale David. (U. Pittsburgh) Delayed object-quality discriminations in hemisectomized monkeys. *J. comp. physiol. Psychol.*, 1961, 54, 619-624.—Monkeys were tested on 3-trial object discrimination problems, in which intertrial intervals varied from 20 to 120 sec. Normals performed significantly better than a hemisectomized group on the task as a whole. "It was concluded that the delay variable, at the longest interval at least, interfered with the performance of both groups . . . but that the effect of other intervals was greater on the operated animals."—W. A. Wilson, Jr.

545. McCleary, Robert A. (U. Chicago) Response specificity in the behavioral effects of limbic system lesions in the cat. *J. comp. physiol. Psychol.*, 1961, 54, 605-613.—Cats were trained in 2 avoidance situations: a shuttle-box, which required an active avoidance response, and a food-trough shock situation, which elicited a passive avoidance response. Cats with subcallosal lesions were deficient only in passive avoidance, while cats with cingulate lesions were deficient only in active avoidance. The response-specific effects of these lesions are consistent with the opposing motor effects of stimulation of these structures.—W. A. Wilson, Jr.

546. Meyer, Patricia Morgan. (Ohio State U.) A behavioral analysis of cats with extensive neocortical ablations. *Dissert. Abstr.*, 1961, 21(10), 3174.—Abstract.

547. Nutsbidze, M. A. (Inst. Physiology, Tbilisi, USSR) Rol' gippokampovoi izviliny obrazovaniï vremennykh svyazei. [Role of the hippocampal convolution in the formation of conditioned connections.] *Soobshch. Akad. Nauk Gruz. SSR*, 1961, 27(6), 765-770.—Hippocampal destruction in cats leads postoperatively to the following changes: (a) difficulty in developing "conditioned automatized alimentary reactions," (b) poor expression of previously developed "conditioned automatized alimentary reactions," (c) difficulty in expression of behavioral reactions with change of experimental conditions, and (d) delay in extinction of the orienting reflex. The author concludes that these changes occur as a consequence of weakening of the visual and auditory functions following hippocampal destruction, and that the hippocampus participates in the formation of conditioned connections and in the extinction of the orienting reflex.—I. D. London.

548. Rougeul, A., & Buser, P. Effets de l'élimination transitoire d'une arie primaire sensorielle sur une performance motrice conditionnée chez le chat. [Effects of temporary elimination of one primary sensory area on motor conditioned performance in the cat.] *J. Physiol., Paris*, 1962, 54, 408.—Thermodes were implanted over certain cortical areas, allowing rapid and reversible cooling of the cortex, thus avoiding problems of vicarious function which may occur after lesions. Conditioned responses to light dropped out when the visual cortex was cooled, although auditory stimuli remained effective. The effect is contrasted with those of lesions, and is interpreted as an immediate cortical control of motor action, specific to the modality of the area studied.—C. J. Smith.

549. Skultety, F. Miles. (State U. Iowa) Experimental mutism in dogs. *Arch. Neurol.*, 1962, 6, 235-241.—Electrolytic lesions which involve the transverse extent of the periaqueductal grey matter beneath the superior colliculus resulted in life-long mutism in 3 dogs out of 7. 1 of these mute animals became hyperphagic. 4 Ss were mute for only a few days after the operation. The point is made that, apart from the cat and dog, experimental mutism has not been demonstrated in other species. (20 ref.)—R. Gunter.

550. Smith, Moncrieff H., Salisbury, Robert, & Weinberg, Harold. (U. Washington) The reaction of hypothalamic-hyperphagic rats to stomach preloads. *J. comp. physiol. Psychol.*, 1961, 54, 660-664.—Hypothalamic-hyperphagic rats were compared with sham operates on their reaction to preloads of water, nonnutritive bulk, and hypertonic solutions. When restricted to a 2-hour eating period, the hyperphagic rats ate no more than controls, and ate significantly less after any test procedure. It is suggested that hypothalamic hyperphagia is part of a generalized "exaggerated affective reaction."—W. A. Wilson, Jr.

551. Stamm, J. S., & Pribram, K. H. (Inst. Living) Effects of epileptogenic lesions of inferotemporal cortex on learning and retention in monkeys. *J. comp. physiol. Psychol.*, 1961, 54, 614-618.—Aluminum hydroxide cream was placed over inferotemporal cortex of monkeys, leading to persistent focal paroxysmal discharges beginning 2-3 mo. later. The epileptoid Ss were inferior to normals on visual pattern and object discriminations, but not on delayed alternation. Animals tested for retention of a preoperatively learned discrimination showed only temporary slight drops in proficiency, immediately after operation and again after the onset of discharges. "An epileptogenic focus . . . interferes with the efficient learning of a task but not with the memory for that task."—W. A. Wilson, Jr.

552. Trevarthen, C. B. (Inst. Technology, Pasadena) Double visual learning in split-brain monkeys. *Science*, 1962, 136(3512), 258-259.—Split-brain monkeys (with forebrain divided) were trained to perform 2 contradictory visual tasks simultaneously, 1 task being presented to each eye. Usually 1 cerebral hemisphere dominated, but in some cases the 2 halves of the brain learned simultaneously. Contradictory color discriminations showed interference or transfer of learning until midbrain commissures were also sectioned. The more extensive surgery failed to prevent transfer of simple brightness discriminations.—Journal abstract.

553. Warren, J. M., Warren, Helen B., & Akert, K. (Pennsylvania State U.) Umweg learning by cats with lesions in the prestriate cortex. *J. comp. physiol. Psychol.*, 1961, 54, 629-632.—Normal cats, cats with lesions of prestriate cortex (the middle suprasylvian gyrus), and cats with lesions of orbitofrontal cortex, were tested on the Hebb-Williams maze. The prestriate Ss were inferior to both of the other groups in original learning; both operate groups were inferior to normals in relearning 6 mon. later. Since 2 cats which were trained before prestriate operations showed no postoperate loss, it was suggested that "the prestriate region is necessary for adequate learning of some visual tasks but

less essential for retention of preoperatively learned habits."—*W. A. Wilson, Jr.*

554. Young, J. Z. (University Coll., London, England) **Memory mechanisms of the brain.** *J. ment. Sci.*, 1962, 108(453), 119-133.—Study of brain and behavior in the octopus suggests the possible physical system that constitutes a representation of past events. Animals trained to respond to food and to pain, and then operated, show retention of behaviors toward vertical and horizontal stimuli. A system of superposed circuits, with spreading amplifying and depressing parts to them, provides for a balanced system of motivation and optimizing response to reward.—*W. L. Wilkins.*

BRAIN STIMULATION

555. Rabe, Ausma. (U. Michigan) **The effect of subcortical stimulation on memory and responsiveness in rats.** *Dissert. Abstr.*, 1961, 21(12), 3864-3865.—*Abstract.*

556. Robinson, Bryan W., & Mishkin, Mortimer. (National Inst. Mental Health, Bethesda, Md.) **Alimentary responses evoked from forebrain structures in *Macaca mulatta*.** *Science*, 1962, 136(3512), 260-261.—Previous work on the mechanisms of hunger-satiety in mammals has led to the localization of these functions in the lateral and ventromedial hypothalamic areas. The present work indicates that portions of the frontal lobe, temporal lobe, cingulate gyrus, septum, and thalamus are involved as well.—*Journal abstract.*

557. Samuels, Ina. (U. Michigan) **The effect of electrical stimulation of the thalamus on the performance of rats during visual discrimination.** *Dissert. Abstr.*, 1961, 21, 3865.—*Abstract.*

558. Sheer, Daniel E. (Ed.) **Electrical stimulation of the brain.** Austin, Tex.: Univ. Texas Press, 1961. xiv, 641 p. \$17.50.—A comprehensive review of research and thinking on brain stimulation organized into 7 parts: "Introduction," "Techniques," "Neuroanatomical Correlates," "Neurophysiological Correlates," "Behavioral Correlates," "Experiential Correlates," and "Summary." The more behavioral papers are: "The Reticular Activating System and Perceptual Integration" (D. B. Lindsley), "Differential Effects of Drives and Drugs on Self-Stimulation at Different Brain Sites" (J. Olds), "Food Intake and Hypothalamic Stimulation" (O. A. Smith, Jr.), "Diencephalic Influences on Learning and Performance" (J. R. Knott & W. R. Ingram), "Effects of Hippocampal Afterdischarges on Conditioned Responses" (J. P. Flynn, P. D. MacLean, & C. Kim), "Learning and Performance Motivated by Direct Stimulation of the Brain" (N. E. Miller), "Conditioned Reflexes Formed and Evoked by brain Stimulation" (R. W. Doty), "Motivation-Emotional factors and Intracranial Self-Stimulation" (J. V. Brady), "Emotional Facilitation in Learning Situations with Subcortical Stimulation" (D. E. Sheer), "Interference and Improvement in Performance Produced by Cortical Stimulation" (N. M. Burns & G. J. Mogen-son), "Psychological Effects of Excitation in the Limbic System" (H. E. King), "Implications for Systematic Studies of Behavior" (K. H. Pribram), and "Implications for Theories of Reinforcement" (N. E. Miller). (1500 ref.)—*C. T. Morgan.*

Central Stimulation

559. Aarons, Louis; Masserman, Jules H., & McAvoy, Thomas. (Northwestern U. School Medicine) **Brain stimulation, experience, and behavior.** *Amer. J. Psychiat.*, 1962, 118(11), 982-994.—Electrodes implanted into the brain permitted electrical brain stimulation of 8 rhesus monkeys (4 with brain lesions) and 6 cats. Results showed that "threshold" stimulation of different brain regions had no interference effect on previously established auditory-visual discriminations. Other results obtained do not fit in with the notion of the specificity of brain "centers."—*N. H. Pronko.*

560. Egger, M. David, & Flynn, John P. (Yale U.) **Amygdaloid suppression of hypothalamically elicited attack behavior.** *Science*, 1962, 135(3510), 43-44.—Electrodes were implanted in the hypothalamus and in the amygdala of adult cats. Electrical stimulation of the amygdala suppressed attack behavior elicited by the hypothalamic stimulation.—*Journal abstract.*

561. Faure, J., Bensch, C., Albrecht, C., & Vigneron, G. **Action des formations mésencéphalo-limbiques et habénulaires dans les activités olfactobucco-ano-génito-sexuelle chez la lapin libre et éveillé.** [Action of the midbrain limbic and habenular formations in olfacto-bucco-ano-genito-sexual activities in the unrestrained, waking rabbit.] *J. Physiol., Paris*, 1962, 54, 334-335.—Stimulation of the tegmentum at the pontine-midbrain junction, the interpeduncular region, and the habenular area produces, in the female rabbit, the "post-reaction EEG," and at different stimulation parameters, oral behavior. Stimulation of the habenula at low frequency and voltage induces a posture similar to that adopted for copulation.—*C. J. Smith.*

562. Herberg, L. J. **Physiological drives investigated by means of injections into the cerebral ventricles of the rat.** *Quart. J. exp. Psychol.*, 1962, 14(1), 8-14.—A technique is described for permanently implanting a cannula in the lateral ventricle of the rat, and the effects on certain physiological drives of various substances injected by this route were investigated. Food intake was significantly reduced by intraventricular glucose, while intraventricular fructose, insulin, glucagon, and a lipid-mobilizing agent were without effect. Drinking was elicited by hypertonic saline and suppressed by hypotonic solutions. The intake of salt was not affected by intraventricular low-sodium solutions. Intraventricular procaine, but not alcohol, induced an akinetic state. Intraventricular glucose failed to relieve hypoglycaemic coma. The significance of some of these findings is discussed in relation to the hypothalamic regulation of hunger.—*Journal abstract.*

563. Krauthamer, G. **Inhibition par stimulation répétitive des corps striés de réponses évoquées par stimulation somatique au niveau de la formation réticulée et du thalamus.** [Inhibition by repetitive stimulation of the striatum of responses evoked in the reticular formation and thalamus by somatosensory stimulation.] *J. Physiol., Paris*, 1962, 54, 357-358.—Stimulation of the caudate nucleus or globus pallidus in cats under chloralose suppresses electrical responses, elicited by forepaw shock, in centrum medianum and ventralis lateralis of thalamus, the subthalamic nucleus, and the reticular

formation. This suppression is a true inhibition at some loci and with some stimulation parameters, and possibly an occlusion at others.—C. J. Smith.

564. Michael, Richard P. (Maudsley Hosp., London, England) **Estrogen-sensitive neurons and sexual behavior in female cats.** *Science*, 1962, 136(3513), 322-323.—The stimulation of mating behavior by means of the stereotaxic introduction of small implants of solid C¹⁴-diethylstilbestrol di-n-butyrate to the hypothalamus of ovariectomized cats is described. Autoradiographic examination of the brains of mating animals reveals that certain neurons in the region of these implants show a selective affinity for labeled estrogen.—*Journal abstract*.

565. Wasman, Marvin, & Flynn, John P. (Western Reserve U.) **Directed attack elicited from hypothalamus.** *Arch. Neurol.*, 1962, 6, 208-219.—Directed attack was obtained by hypothalamic stimulation in 15 cats originally selected for not attacking mice. Instances were observed where such stimulation also led to attack without rage, as well as to the occurrence of rage without attack. These behavior forms are related to different anatomical locations.—R. Gunter.

Electroshock

566. Williams, Gertrude J. (Division Health, St. Louis, Mo.) **The effect of electroconvulsive shock on an instrumental conditioned emotional response ("conflict").** *J. comp. physiol. Psychol.*, 1961, 54, 633-637.—Rats were trained to cross an electrified grid to reach water; conflict, measured as hesitation to cross the grid, was shown in no-shock test trials as long as 60 days later. However, a group which received a series of ECSs after the completion of conflict training showed no hesitation on the test trials. It was suggested that the impact of the stimuli associated with conflict is lessened by the increased variety of extraneous stimuli to which convulsed animals respond emotionally.—W. A. Wilson, Jr.

ELECTROENCEPHALOGRAPHY

567. Blozovski, M. **Electrocorticogramme du Lapin nouveau-né** [The electrocorticogram of the newborn rabbit.] *J. Physiol., Paris*, 1962, 54, 296-297.—Records were taken from curarized baby rabbits in a study of EEG development. On the 1st day of life, period of silence and 7/sec activity alternate. The predominant frequencies seen were 8/sec and of life, periods of silence and 7/sec activity alternate. 13-15/sec at 2 days; 10/sec and 18-22/sec at 3-4 days; 3.5/sec and 12/sec on the 8-10th day. The adult pattern emerges at the 15th day.—C. J. Smith.

568. Brazier, Mary A. B. (Ed.) **Computer techniques in EEG analysis.** *EEG clin. Neurophysiol. Suppl.*, 1961, No. 20. 98 p.—Proceedings of a conference sponsored by the Brain Research Institute of California in October 1960. Included are 4 papers on harmonic analysis (R. G. Bickford, W. G. Walter, J. R. Knott, H. G. Shipton), 3 on correlation techniques (J. S. Barlow, W. Storm van Leeuwen, W. R. Adey), 3 on averaging techniques with brain potentials (M. H. Goldstein, A. Remond, G. L. Gerstein), single papers on EEG pattern recognition (B. G. Farley) and digital techniques (W. A. Clark), and summary and commentary by W. G. Walter and W. A. Rosenblith.—L. C. Johnson.

569. Cadilhac, J., Passouant-Fontaine, T., & Passouant, P. **L'organisation des divers stades du sommeil chez le chaton le la naissance à 45 jours.** [Organization of various stages of sleep in the kitten, from birth to 45 days.] *J. Physiol., Paris*, 1962, 54, 305-306.—EEG study of normal sleep in the kitten reveals 4 stages. In the 1st, lasting 10 days, one can distinguish waking and agitated sleep; after the eyes open, a 3rd phase, calm sleep, emerges. From the 20th day on, synchronization of hippocampal EEG activity occurs during agitated sleep; after 40 days, hippocampal synchronization is well established during the waking state.—C. J. Smith.

570. Calvet, J. **Comparaison de l'activité électroencéphalographique dérivée par électrodes de surface et par électrodes transcorticales.** [Comparison of electroencephalographic activity derived from surface electrodes and from transcortical electrodes.] *J. Physiol., Paris*, 1962, 54, 308-309.—It is demonstrated that the usual monopolar EEG recording may falsely indicate activity in a cortical area, the true source lying at some distance from the electrode. Transcortical recording techniques eliminate this source of error, yielding only activity located between the 2 pickup electrodes.—C. J. Smith.

571. Faure, J. **Rôle du mésencéphale dans la phase "paradoxe" du sommeil chez le lapin.** [Role of the midbrain in the paradoxical phase of sleep in the rabbit.] *J. Physiol., Paris*, 1962, 54, 333-334.—Brain stimulation may influence the appearance of the paradoxical phase of sleep (waking-type EEG, loss of muscle tonus, and behavioral signs of sleep) in the rabbit. Stimulation of the tegmentum at the junction of midbrain and pons, and in dorsal and ventral midbrain tegmental nuclei, yields a long paradoxical phase, isolated, or followed by oral-anogenital behavior. Stimulation of central gray or middorsal paramedian tegmentum produces a shorter paradoxical phase followed by the same behavior. Paradoxical sleep depends on a circular pathway involving midbrain, hypothalamus, limbic areas, habenula, and midbrain, connected to the medulla.—C. J. Smith.

572. Genkin, A. A. (Leningrad Neurosurgical Inst.) **O vyyalenii v elektroentsefalogramme spetsificheskoi lokal'noi reaktivnosti mozga pri slozhnoi deyatel'nosti** [On the examination in electroencephalograms of specific local reactions of the brain during complex activity.] *Vop. Psikh.*, 1961, No. 6, 114-126.—This is an attempt to obtain characteristics of particular cortical areas during various mental processes. "34 EEG frames obtained for 5 subjects have been subjected to a quantitative analysis. By considering the correlations between EEG channels (recording from Brodmann areas 39, 37, and 18) it has been found that under certain conditions a specific reaction of particular brain fields under adequate intellectual activity is identified . . . in thinking processes based mainly on visual concepts a local reaction of the visual cortex is quite distinct." Problems involving symbolic manipulations yield reactions of the subsincipital portion. These reactions are reliable under identical experimental conditions but are less apparent when the alpha-rhythm is slightly suppressed.—H. Pick.

573. Horovitz, Zola P., & Chow, May-I. (Squibb Inst. Medical Research, New Brunswick, N. J.) **Desynchronized electroencephalogram in the deeply sleeping cat.** *Science*, 1961, 134(3483), 945.

—Electroencephalographic patterns of the different states of sleep in the cat are shown, with special reference to a desynchronized deep sleep. This sleep stage is characterized by an increase in reticular stimulation arousal threshold and by the reappearance of 5-6 spikes per second on the electroencephalogram immediately after threshold behavioral arousal.—*Journal abstract.*

574. Karp, Eric; Pollack, Max, & Fink, Max. (Hillside Hosp., Glen Oaks, N. Y.) Critical flicker frequency and EEG alpha: A reliability study. *EEG clin. Neurophysiol.*, 1962, 14, 60-63.—Correlations between resting percent time alpha activity and critical flicker frequency threshold were sought in 9 volunteer and 30 psychiatric Ss. Test-retest correlations for each test were high, but intercorrelations were insignificant.—L. C. Johnson.

575. Liberson, W. T., & Frazier, William H. (VA Hosp., Hines, Ill.) Evaluation of EEG patterns of newborn babies. *Amer. J. Psychiat.*, 1962, 118, 1125-1131.—A series of 136 neonates was given EEG examinations within a few hours of birth. Babies with caesarian section had more "ideal" EEGs than those with noncaesarian birth or those with obstetrical complications.—N. H. Pronko.

576. Mangan, G. L., & Adcock, C. J. EEG correlates of perceptual vigilance and defence. *Percept. mot. Skills*, 1962, 14, 197-198.—The findings for 11 Ss trained to a defensive criterion and 10 to a vigilance criterion permit several conclusions. The frontal limits (FI) index measures something which decreases significantly when critical and neutral stimuli are presented to defensive Ss, and when critical but not neutral material is presented to vigilance Ss. Defensive Ss show significant differences from vigilant Ss with neutral and critical stimuli. Since FI is a negative measure of emotionality, it appears that defensive Ss become emotional under test conditions, but that this is less of a specific reaction to critical words than is the case with vigilant Ss.—W. H. Guertin.

577. Verley, R., & Mourek, J. Evolution post-natale de l'amplitude de l'activité électrocorticale. [Postnatal development of the amplitude of electrocortical activity.] *J. Physiol., Paris*, 1962, 54, 427-428.—The development of 8-14/sec EEG activity was followed in young cats and rabbits. The amplitude of these spindles, measured with transcortical electrodes, increases from 15-25 microvolts in the 1st days of life to 400-500 microvolts by one month. Hypotheses about growth in amplitude of cerebral waves are proposed.—C. J. Smith.

578. Williams, Harold L., Granda, Allen M., Jones, Richard C., Lubin, Ardie, & Armington, John C. (Walter Reed Army Medical Center, Washington, D. C.) EEG frequency and finger pulse volume as predictors of reaction time during sleep loss. *EEG clin. Neurophysiol.*, 1962, 14, 64-70.—7 Ss were tested during a baseline period, during 64 hours of sleep loss and during recovery from sleep deprivation to determine the relationship between perceptual motor reaction time, EEG frequency, and finger pulse volume. With sleep loss, the distribution of EEG frequencies became bimodal in 5 Ss alternately showing alpha waves and low amplitude theta waves. During this period, the EEG showed increasing correlation with reaction time. For 2 Ss

whose EEG never showed the theta rhythm there was no relationship between EEG and reaction time. Pulse volume was never as good a predictor of reaction time as was EEG.—L. C. Johnson.

EVOKED POTENTIALS

579. Albe-Fessard, D., Bowsher, D., & Mallart, A. Réponses évoquées dans la formation reticulée bulbaire au niveau du noyau giganto cellulaire d'Olszewski: Rôle de ce noyau dans la transmission vers le centre médian du thalamus des afférences somatiques. [Evoked responses in Olszewski's nucleus gigantocellularis of the bulbar reticular formation: The role of this nucleus in transmission of somatosensory afferent impulses to thalamic nucleus centrum medianum.] *J. Physiol., Paris*, 1962, 54, 271.—A study on cats under chloralose revealed convergence of sensory volleys from different parts of the body on the same cell in reticular nucleus gigantocellularis (GC). Stimulation of this nucleus produced responses in thalamic centrum medianum (CM); cooling of GC blocked somatosensory responses in CM. The authors conclude that most somatosensory information destined for CM passes via GC.—C. J. Smith.

580. Bach y Rita, P. Caractéristiques des activités évoquées dans diverses régions de la rétículo bulbaire et mésentéphalique. [Characteristics of activities evoked in various regions of the bulbar and midbrain reticular formation.] *J. Physiol., Paris*, 1962, 54, 283-284.—Acoustic and somatic responses were mapped throughout the reticular formation in cats under chloralose or curare. Responses with latencies less than 20 msec. were picked up from the entire extent of the reticular formation. A secondary response, often larger than the first, and with a latency of 100-200 msec., was recorded from nuclei pontis and gigantocellularis. A rhythmical afterdischarge was sometimes observed.—C. J. Smith.

581. Bruner, J., & Sindberg, R. Différenciation de deux catégories de projections visuelles non primaires sur le cortex associatif suprasylvien du chat: Influences de la formation réticulée et du cortex visuel. [Differentiation of two categories of nonprimary visual projections on the suprasylvian associative cortex of the cat: Influences of the reticular formation and of the visual cortex.] *J. Physiol., Paris*, 1962, 54, 303.—Visual responses from the associative suprasylvian cortex of the cat under chloralose are divided into those from a well-localized lateral zone, similar to the primary visual response, and others from a medial zone. Distinguishing features of the medial zone are greater sensitivity to 1/sec stimulation, short-latency response to stimulation of midbrain reticular formation, large reaction to electrical stimulation of visual cortex, and response to somatic and acoustic stimuli.—C. J. Smith.

582. Burns, B. Delisle; Heron, W., & Pritchard, R. (McGill U.) Physiological excitation of visual cortex in cat's unanaesthetized isolated forebrain. *J. Neurophysiol.*, 1962, 25, 165-181.—Responses of single neurones in the visual cerebral cortex of the unanaesthetized, isolated cat's forebrain to excitation of the retina with patterned light were studied. Eye movements were prevented. All visual units examined displayed continual activity in the unstimulated preparation. An appropriately lo-

cated change of retinal illumination, produced by movement or flashing of a pattern, would drive these units away from their mean frequency of discharge for a short time. Stationary, continuously illuminated patterns produced no detectable influence upon the behaviour of cortical neurones except at "on" and "off." The behaviour of cortical units was not the same following each of a series of identical retinal stimuli. The mean frequency of discharge per minute of visual units is commonly unaffected by repetitive retinal excitation. Cells that gave "on" responses to patterns in one part of the visual field often gave "off" responses to the same pattern presented in another part of the field. Small cyclical oscillations in the position of retinal patterns provided an extremely efficient way of exciting cortical units. Oscillations of a black-white border (in one line at right angles to the boundary) were most exciting when the amplitude was 50 min. arc and the frequency was 2-4 cps.—G. Westheimer.

583. Crescitelli, Frederick. (U. California, Los Angeles) Some characteristics on on- and off-responses to flashes of colored light in ground squirrel visual system. *J. Neurophysiol.*, 1962, 25, 141-151.—"A wavelength specific effect was noted in the electrical potentials evoked at the visual cortex of the antelope ground squirrel by long flashes of colored light delivered to the contralateral eye. This effect was indicated by the presence of a discontinuity in behavior between 454 m μ and 469 m μ . Responses to 454 m μ and 424 m μ were characterized by large on-components and by off-waves which were one sixth (or less) the size of the on-potentials. Responses to flashes at wavelengths of 469 m μ or longer possessed both on- and off-components which were of about equal magnitude."—G. Westheimer.

584. Deura, Shigeyuki. (Northwestern U.) Long-latency cerebellar responses in cerebellar pedunculi and cortex. *Neurology*, 1961, 11, 940-949.—After the posterior pole of one cerebral hemisphere was ablated, the anterior lobe of that side of the cerebellum and the posterior lobes of both sides were exposed and explored in 28 cats. Stimulations were carried out by concentric or paired silver wire (2 mm. separation) lightly applied to the pial surface of various areas of the cerebral cortex. "Cerebrocerebellar connections indicated by the short-latency responses were more widely distributed than the long-latency ones. Action potentials in response to stimulation of the cerebral cortex were observed in the contralateral lobe anterior, lobulus simplex, tuber vermis, pyramis, lobulus paramedianus, crus I lobulus ansiformis and lobulus parafloccularis. Responses were present in the homolateral lobulus paramedianus occasionally. The short-latency responses were elicited after stimulation of the anterior sigmoid, posterior sigmoid, anterior lateral, anterior suprasylvian, middle suprasylvian and middle ectosylvian gyri. No responses were seen after stimulation of the posterior lateral, posterior suprasylvian, posterior ectosylvian, and posterior sylvian gyri. Thresholds of cerebral stimulation which evoke the cerebellar responses increased after section of the superior, middle and inferior cerebellar pedunculi.—R. Gunter.

585. Fourment, A., & Scherrer, J. Réponses extra-primaires chez le lapin implanté. [Extra-primary responses in the implanted rabbit.] *J.*

Physiol., Paris, 1962, 54, 342-343.—Implanted transcortical electrodes in the motor, somatosensory, and visual areas of the cortex all picked up responses to visual, somatic, and auditory stimuli. These non-primary responses appeared during the vigilant state, and disappeared during arrest reactions, somnolence, or after barbiturates.—C. J. Smith.

586. Frommer, Gabriel P. (Brown U.) Gustatory afferent responses in the thalamus. In Morley R. Kare & Bruce P. Halpern (Eds.), *The physiological and behavioral aspects of taste* (see 37: 256). Pp. 50-59.—". . . the responses to gustatory stimuli may be recorded from the medial extension of the ventral nucleus of the thalamus. The ventral nucleus of the thalamus is the homologue of Rose and Mountcastle's (1952) ventrobasal complex. These responses have properties similar to those observed in many peripheral sites, and the localization of the responsive area is in good agreement with tongue experiments on thalamic lesions resulting in taste deficits."—E. Y. Beeman.

587. Galifret, Y. Evaluation de l'efficience d'une stimulation à partir de réponses unitaires centrales. [Evaluation of the efficacy of a stimulus by means of central unit responses.] *J. Physiol.*, Paris, 1962, 54, 343-344.—A study of single neurons in the pigeon's lateral geniculate nucleus shows that the classical law of frequency of discharge as a function of log intensity of the photic stimulus is incorrect. The empirical function resembles an inverted U. Latency, however, is related logarithmically to stimulus intensity. By plotting the slope of the generator potential of a receptor (e.g., Pacinian corpuscle) as a function of log stimulus, it is seen that the latency of the 1st sensory volley depends on the time required for the generator potential to reach critical voltage.—C. J. Smith.

588. Geisler, C. Daniel, & Rosenblith, Walter A. (Massachusetts Inst. Technology) Average responses to clicks recorded from the human scalp. *J. Acoust. Soc. Amer.*, 1962, 34, 125-127.—"The use of a method of electronic averaging in the detection of electrical responses from human Ss is briefly discussed. The correlation of such data with psychophysical data from the same S is discussed."—A. M. Small, Jr.

589. Hirsch, J. F., Benoit, O., & Hungerford, D. Réponses corticales à longue latence chez l'animal chronique. [Long-latency cortical responses in the chronic animal.] *J. Physiol.*, Paris, 1962, 54, 353.—In cats with implanted electrodes, shocks to the skin on one side produced fluctuating responses on both sides of the brain. The latencies were 30-40 msec., and locations included associative areas, and primary visual, auditory, and somatosensory cortex. When S is resting quietly or sleeping, long-latency responses are found easily; they disappear completely during arousal, either spontaneous or induced by reticular stimulation. Auditory and visual long-latency responses were similar to the somatic type.—C. J. Smith.

590. Lelord, G., & Kummer, J. L. Réponses évoquées au niveau du cortex somatique primaire du chat éveillé libre par des stimulations sonores, alternées avec des stimulations non douloureuses du nerf radial. [Responses evoked in the primary somatosensory cortex of the waking, unrestrained

cat by acoustic stimuli, alternated with painless stimulation of the radial nerve.] *J. Physiol., Paris*, 1962, 54, 368.—Do conditioned responses, normally obtained by paired stimuli, also appear for alternated stimuli? To answer this question, an acoustic beep and a small electric shock to the radial nerve were presented alternately, with intervals varying between 15 sec. and 2 min., and with order randomized. No consistent acoustic responses were seen in somatosensory I for beeps alone; when the stimuli were alternated, responses started to appear. These auditory responses occurred only when the background EEG was characteristic of an alert state.—C. J. Smith.

591. Libouban, S. Mise en évidence au niveau du cortex moteur du rat de réponses évoquées par stimulation somatique. [Demonstration of responses evoked by somatic stimulation recorded from the motor cortex of the rat.] *J. Physiol., Paris*, 1962, 54, 370.—Somatic sensory responses may be found in the frontal pole including the entire extent of the motor cortex in curarized rats under chloralose or thiopentone. All 4 paws and the face converged upon any given spot studied; occlusion was demonstrated with paired shocks to different parts of the body. Stimulation of the pretectal nuclei gives responses very similar to these somatic potentials.—C. J. Smith.

592. Marty, R. Aspects évolutifs des activités sensitivo-sensorielles au cours du développement. [Genetic aspects of sensory activities during development.] *J. Physiol., Paris*, 1962, 54, 373.—An electrophysiological study of postnatal development of cat and rabbit shows that somatosensory responses occur before auditory responses, and that visual activity is the last to appear. Thus electrophysiology confirms behavioral observations.—C. J. Smith.

593. Naquet, R., Denavit, M., & Albe-Fessard, D. Ralentissements et accélérations de l'activité corticale obtenus par refroidissement localisé de la formation réticulée mésencéphalique du chat éveillé. [Slowing and acceleration of cortical activity obtained by localizing cooling of the midbrain reticular formation of the waking cat.] *J. Physiol., Paris*, 1962, 54, 386.—A new method of localized cooling of certain areas of the brain is used to produce local blockade of activity. When the cooling probe is placed in the reticular formation of the curarized cat posterior to stereotaxic level A3, there is bilateral acceleration of EEG activity. Between A3-5, cooling produces ipsilateral slowing of the cortical record. All effects are quite reversible.—C. J. Smith.

594. Rhodes, J. M., Smith, C. J., Lanor, J., & Naquet, R. Nouvelle approche des effets de la stimulation réticulée sur les réponses évoquées de long de la voie visuelle. [A new approach to the effects of reticular stimulation on evoked responses along the visual pathway.] *J. Physiol., Paris*, 1962, 54, 405-406.—Responses to photic stimulation, recorded from the chiasm and optic tract of the unanesthetized cat, are stable both during and between periods of reticular stimulation. Cortical visual responses have a high degree of variability, related to background EEG activity. Significant changes in the cortical response occur as a function of frequency of photic stimulation, and as a consequence of reticular stimulation.—C. J. Smith.

595. Schwartz, Marvin, & Shagass, Charles. (State U. Iowa) Effect of different states of alertness on somatosensory and auditory recovery cycles. *EEG clin. Neurophysiol.*, 1962, 14, 11-20.—Evoked auditory and somatosensory potential and recovery functions were examined in different states of alertness, as defined by the EEG in 3 cats with chronic preparations. Additional observations were made on 7 acutely prepared cats. Consistent results between cats were found for only the somatosensory modality. Both early and late components of somatosensory potentials were reduced during alerting. Cortical recovery consistently shifted between cats and between modalities. With a nonalert EEG there was greater peak recovery. It was concluded that recovery changes are probably not cortical in origin and reflect generalized changes in excitability of the CNS.—L. C. Johnson.

596. Steriade, M., & Demetrescu, M. (Neurological Inst., Bucharest). Reticular facilitation of responses to acoustic stimuli. *EEG clin. Neurophysiol.*, 1962, 14, 21-36.—Responses evoked by single or rhythmic clicks at the level of cortical and subcortical, specific and nonspecific structures, were recorded in 37 encéphale isolé cats. Diminution of acoustic response is not a global event during electrocortical arousal induced by mesencephalic reticular formation stimulation. Simultaneous suppression and facilitation of potentials recorded in the same sensory area were found to a single mono or binaural click. Cortical potentials, evoked by rhythmic clicks, exhibit reticular facilitation. From rates of 5/sec upward reticular facilitation is extended to all recorded areas of the auditory cortex. Reticular stimulation causes responses to recover their initial amplitude after habituation. These results confirm previous data concerning responses to flickering light.—L. C. Johnson.

597. Uttal, W. R., & Cook, L. Systematics of the evoked somatosensory cortical potential. *IBM J. Res. Developm.*, 1962, 6(2), 179-199.—This paper presents the results of a series of experimental studies in which a digital computer averaging technique was used to explore the dynamics of the electric response of the human somatosensory cortex evoked by pulse electrical stimulation of nerves in the wrist. A nomenclature is presented for the typical components of the complex waveform which the authors consider to be representative of the evoked potential. The effects of stimulus amplitude, bilateral and bitemporal stimulation, and sleep on the evoked corticogram were investigated. Psychophysical studies were also carried out which complemented the evoked potential studies, and comparisons were made between the neurological and psychological data.—W. R. Uttal.

SENSORY PHYSIOLOGY

598. Ali, M. A. (U. Montreal) Retinal response in enucleated eyes of atlantic salmon (*Salmo salar*). *Rev. Canad. Biol.*, 1962, 21, 7-15.—Enucleated eyes from light and dark adapted fish were subjected to light and darkness for one hour, fixed in Bouin's, sectioned, and examined. The state of retinal epithelium was not affected by placing it in light or dark. Cone myoids of dark adapted fish remained expanded while those from light adapted eyes became expanded and both were independent of

having been previously in the light or dark. The retina probably dies one hour after enucleation and it is difficult to determine whether the cones of enucleated eyes are capable of responding to light or darkness.—*M. J. Wayner, Jr.*

599. Dawson, William W. (Florida State U.) The corneal afferent system: A deviation from Helmholtz's theory of specific fiber energies. *Dissect. Abstr.*, 1961, 21(12), 3860-3861.—*Abstract.*

600. De Valois, Russell L., Jacobs, Gerald H., & Jones, Arthur E. (Indiana U.) Effects of increments and decrements of light on neural discharge rate. *Science*, 1962, 136(3520), 986-987.—Neurons in the lateral geniculate nucleus of the monkey discharge impulses periodically under conditions of both dark and light adaptation. Brief intensity changes in one direction produce decreases in firing rate roughly proportional to the logarithm of the intensity; intensity changes in the other direction produce corresponding increases in firing in the same neuron.—*Journal abstract.*

601. Dzendolet, E. Electrical stimulation of single human taste papillae. *Percept. mot. Skills*, 1962, 14, 303-317.—2 Ss reported salty taste at near threshold stimulation. Results do not support the hypothesis of direct stimulation of either the receptors or the nerves. Suprathreshold cathodal and anodal stimulation were reported as pain or tactile sensations rather than taste. The order of thresholds at different concentrations of salt suggested that concentration is not the primary variable in taste stimulation. The results suggested that the threshold is a function of the rate at which ions are presented to the receptors.—*W. H. Guertin.*

602. Elenius, V., & Ahlas, A. (U. Turku) The effect of intensity of light adaptation on the recovery in the dark of the human electroretinogram. *Acta ophthalm., Copenhagen*, 1961, 39(6), 1020-1028.—The rate of ERG b-wave recovery was analyzed for one S, using stimulus flashes of 0.1 sec. duration, or flickering light at 30 cps. Following light adaptation with light of about 0.01 mV intensity and of 5 min. duration, a nearly maximal amplitude of the b-wave is obtained after about 10 min. in the dark. After light adaptation with light of about 1 mV intensity, the b-wave has regained about 80% of its maximal amplitude after 6 min. in the dark, and about 90% after about 10 min. If lights more intense than about 1 mV are used for light adaptation, the subsequent dark adaptation is much slower. Stimulation intensities above 1 mV are sufficient to evoke photopic flicker potentials and negative components of the single flash electroretinogram.—*M. S. Katz.*

603. Ercoles, Anna Maria, & Ronchi, Lucia. (Ist. Nazionale Ottica-Arcetri, Florence, Italy) Reliability of the electroretinogram as a response to a light stimulus. *Aerosp. Med.*, 1962, 33, 69-74.—During visual experiments, ERG records were obtained from 3 Ss, either well trained or naive. The shape of the ERGs appeared to vary as a function of the S's experience. The changes occurred independently of either the intensity of the stimulus or the adaptation state of the retina. It was suggested that factors such as "training" and "expectation" may affect the ERG response.—*J. C. G. Loring.*

604. Flanagan, James L., & Bird, Carol M. (Bell Telephone Lab., Murray Hill, N. J.) Minimum

phase response for the basilar membrane. *J. Acoust. Soc. Amer.*, 1962, 34, 114-118.—Appreciable experimental data exist for the amplitude of basilar membrane displacement as a function of sound frequency. Data on the phase of displacement vs. frequency are meager. A digital computer was programmed to calculate: (a) minimum phase functions corresponding to the experimental amplitude vs. frequency responses, (b) inverse Fourier transforms of the experimental amplitude and phase data, and (c) inverse transforms of the experimental amplitude and calculated minimum phase data. The results show that at low frequencies the experimental amplitude and phase data do not seem completely compatible. For several reasons, the phase data seem more likely to include a small imprecision than do the amplitude data.—*A. M. Small, Jr.*

605. Jung, Richard, & Kornhuber, Hans. (Eds.) (U. Freiburg, Germany) *Neurophysiologie und Psychophysik des visuellen Systems*. [The visual system: Neurophysiology and psychophysics.] West Berlin, Germany: Springer, 1961. viii, 524 p. DM 85.—Uniting subjective and objective sensory physiology of the visual system was the goal of a symposium held at Freiburg in the fall of 1961. The papers and discussions of this meeting are collected in the above volume. Emphasis at the symposium was mainly on electrophysiology as well as on research aiming at understanding and explaining the functions and capabilities of the visual system by quantitative comparisons of neural or psychophysiological effects of visual stimuli. The topics covered at the symposium were: (a) the retina, (b) lateral geniculate body, (c) peripheral and central bases of color vision, (d) tectum opticum, (e) the visual cortex, (f) informational value of different neuron types in the visual system, (g) synopsis of subjective and objective sensory physiology of vision.—*K. M. Newman.*

606. Karli, P. Absence des cellules visuelles et fonction photoréceptrice de la rétine chez la souris. [Absence of visual cells and photoreceptive function of the retina in the mouse.] *J. Physiol., Paris*, 1962, 54, 355-356.—A strain of mice in which there is hereditary disappearance of visual photoreceptors and loss of ERG is described. These animals have a pupillary reaction to light, and can learn a visually guided task which, however, disappears if the optic tracts are cut. The spectral sensitivity curve is essentially normal in shape but much less sensitive. Visual purple seems to disappear during degeneration, indicating that a number of problems regarding photosensitivity in these mice have yet to be solved.—*C. J. Smith.*

607. Kitchell, Ralph L. (U. Minnesota) Neural response patterns in taste. In Morley R. Kare & Bruce P. Halpern (Eds.), *The physiological and behavioral aspects of taste* (see 37: 256). Pp. 39-48.—A discussion of "some of the features of the neural responses from a peripheral receptor field . . . [and the] variables which must be considered in obtaining, recording, and interpreting the neural responses."—*E. Y. Beeman.*

608. Knoll, M., Kugler, J., Eichmeier, J., & Hofker, O. Note on the spectroscopy of subjective light patterns. *J. anal. Psychol.*, 1962, 7(1), 55-69.—In a method employing electrodes applied with a strap to the forehead, the authors elicit a wide

range of subjective light patterns, some of which alter their shape during constant excitation. All patterns were of an abstract nature. "The number of subjective patterns excitable in each individual was larger for mental patients than for the healthy control sub-group." It is "probable that, besides the retinal ganglion network, the visual (but not the temporal) cortex or the primary visual pathway participates in the pattern excitation phenomenon." (22 ref., German summary.)—*D. A. Santora.*

609. Lawrence, Merle; Wolsk, David, & Schmidt, Pieter. (U. Michigan) Inner ear response to high-level sounds. *J. Acoust. Soc. Amer.*, 1962, 34, 102-108.—The cochlear ac potentials in response to a stimulating tone of rapidly increasing intensity undergo a rapid reduction in amplitude after reaching a certain maximum. The record seen on the cathode ray screen is indistinguishable from that reported for middle ear muscle action, yet the response described here occurs in the absence of muscles of the entire middle ear. This effect is ascribed to overloading in the inner ear. The rate of rise of a tone makes no difference in the form of the cochlear ac response. This finding suggests that the inner ear behaves the same in the presence of impact noise as it does in the presence of steady-state or slowly rising tones.—*A. M. Small, Jr.*

610. Mallart, A. Sur quelques propriétés des champs récepteurs des cellules du relais thalamique somatique primaire. [Some properties of the receptive fields of cells of the primary somatosensory thalamic relay.] *J. Physiol., Paris*, 1962, 54, 372-373.—Some neurons in nucleus ventralis posterior lateralis of the cat under chloralose respond to stimulation anywhere on a limb, indicating a high degree of convergence. Inhibition (depression of spontaneous activity or of the response to a 2nd stimulus) can be shown by applying a subthreshold stimulus to the center of a receptive field, or by stimulating an adjacent part of the body, and rarely, by stimulating any point on the entire body. Thus there is in the thalamic somatic relay both convergence of excitation, and interference between excitatory and inhibitory inputs.—*C. J. Smith.*

611. Mei, Lei. (Kirov Military-Medical Acad., USSR) O zavisimosti élektricheskoi reaktsii zritel'nogo analizatora ot tsvet svetovogo razdrazheniia. [Electric reaction of the visual analyzer as a function of color of photic stimulation.] *Biophysika*, 1962, 7(2), 218-224.—The electrical reaction of the retina and the initial cortical responses to intense flashes of different hues were studied in pigeons. There is disclosed an intensified initial portion of the electroretinogram (the a-complex) with 6 functional components (a_1 to a_6), which precede the b-wave. The magnitude of the 1st component (a_1) depends on the brightness of the colored stimulus. It is the same for all hues of equal brightness. The character of development of the succeeding components as a whole and the characteristic property of the 2nd component (a_2) are found to depend in particular on the wave-length of the light. The ratio of a_2 to a_1 does not depend on brightness and is always different for different hues. It is concluded that cortical elements react selectively to differently colored signals, sent from the retina.—*I. D. London.*

612. Naka, Ken-Ichi. (Kyushu U. Fukuoka, Japan) Effect of background illumination on the retinal action potential. *Science*, 1962, 136(3519), 877-878.—A study of the relation between the membrane potential and the amplitude of the slow component of the retinal action potential obtained from inside a single insect photoreceptor cell suggests that the slow component is equivalent to the change in the membrane potential caused by background illumination.—*Journal abstract.*

613. Pfaffmann, Carl. (Brown U.) Sensory processes and their relation to behavior: Studies on the sense of taste as a model S-R system. In Sigmund Koch (Ed.), *Psychology: A study of a science. Vol. 4* (see 37: 93). Pp. 380-416.—The historical background of sensory psychology is briefly sketched. The application of electronic instrumentation gave a major impetus to the study of receptor processes, permitting a direct study of the mechanism. Studies of taste and its mechanism of discrimination are reviewed. Classical theories need recasting as 2 or more primary taste stimuli can activate the same sensory-neural units. Gustatory stimulation has important behavioral consequences. Studies on the role of taste in reinforcement are reviewed. (99 ref.)—*E. Y. Beeman.*

614. Ruben, R. J., Fisch, U., & Hudson, W. (Johns Hopkins U.) Properties of the eighth nerve action potential. *J. Acoust. Soc. Amer.*, 1962, 34, 99-102.—"The 8th nerve action potential in the cat was recorded from the round window and from the 8th nerve. The conduction velocity, measured directly and computed from the fiber diameter, was found to be approximately 25 m/sec. Comparison of the onset of the action potential at the round window and its appearance in the eighth nerve showed a delay of 0.3 msec, based upon the theoretical time of transmission according to the conduction velocity. As the stimulus intensity was increased, a decrease in the latency of the action potential of the eighth nerve was noted."—*A. M. Small, Jr.*

615. Trehub, Arnold; Tucker, Irving, & Casavellan, Jane. (VA Hosp., Northampton, Mass.) Epidermal b-waves and changes in basal potentials of the skin. *Amer. J. Psychol.*, 1962, 75(1), 140-143.—In 9 adult Ss "significantly more b-waves (the positive components of the endosomatic GSR) occurred when basal potential shifted in a negative direction than when there was either no basal change or a change in the positive direction. These results support . . . the explanation of skin-potential in terms of polarization and depolarization." The general belief in 2 separately reacting neurophysiological mechanisms to explain the a- and b-wave components is thus unnecessary.—*R. H. Waters.*

616. von Békésy, G. (Harvard U.) Comments of the measurement of the relative size of dc potentials and microphonics in the cochlea. *J. Acoust. Soc. Amer.*, 1962, 34, 124.—It is suggested that because of the complex interaction of generator voltage and shunt and series impedances, investigations to date are not conclusive as to the mechanism of the aural microphonic.—*A. M. Small, Jr.*

617. Wendt, R. Rôle du thalamus et du cortex dans la transmission des afférences somatiques vers l'amygdala chez le chat anesthésié au chloralose. [The role of the thalamus and cortex in

transmission of somatosensory afferent volleys to the amygdala in the cat anesthetized with chloralose.] *J. Physiol., Paris*, 1962, 54, 428-429.—The pathways by which somatosensory impulses arrive at the lateral nucleus of the amygdala have been traced using the technique of temporary blockade by localized cooling of brain tissue. Somatic information travels to the amygdala via ipsilateral somatosensory area II of the cortex.—C. J. Smith.

618. Windelmann, R. K. (Mayo Clinic & Found., Rochester, Minn.) **Cutaneous sensory end organs of some anthropoid apes.** *Science*, 1962, 136(3514), 384-386.—The organized end organs of nerves in glabrous skin of the chimpanzee, orangutan, and gibbon are similar to those of man in form and distribution but are more numerous on the soles of the feet than in man. The author found cholinesterase in all the end organs of all these animals and, in the gibbon, alkaline phosphatase as well.—*Journal abstract.*

ENDOCRINE, BIOCHEMICAL, & CIRCULATORY EFFECTS

619. Beadle, Kathryn R., & Crowell, David. (Dept. Education, Hawaii) **Neonatal electrocardiographic responses to sound: Methodology.** *J. speech hear. Res.*, 1962, 5(2), 112-123.—One full-term, clinically normal, female neonate, 41 hours old, was used to demonstrate the feasibility of utilizing heart rate as a measure of response to sound stimulation. A recordable neonatal electrocardiographic response to sound did occur, but no consistent pattern of response was evident.—M. F. Palmer.

620. Blatt, S. J. (Michael Reese Hosp.) **Patterns of cardiac arousal during complex mental activity.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 272-282.—The purpose of the study was to explore the relationship between cardiac rate, as a measure of autonomic activity, and degree of efficiency in complex mental activity. Following Hebb, it was postulated that motivation to solve problems is accompanied by increased action in the autonomic nervous system; specifically, that efficient problem solving would be accompanied by increased and more variable cardiac activity as compared to nonefficient problem solvers. The results support the hypotheses.—G. Frank.

621. Harlan, William R., Osborne, Robert K., & Graybiel, Ashton. **A longitudinal study of blood pressure.** *USN Sch. Aviat. Med. res. Rep.*, 1962, Proj. MR005.13-3001, Subtask 2, Rep. No. 4. 19 p.—Serial blood pressure determinations have been analyzed in a group of 785 healthy young men followed over an 18-year period. Frequency distribution curves of blood pressure yielded a continuous distribution with a tendency for each individual to maintain his relative ranking in the population during the period of study. Significant relationships could be demonstrated between interval change in blood pressure and weight gain as well as increase in body mass. The increment of blood pressure during the follow-up period was related to somatotype as determined on initial evaluation. A positive family history of vascular disease was associated with a greater increase in blood pressure. Analysis of the characteristics of groups from the upper and lower ends of the frequency distribution curves confirmed the importance of these factors in influencing blood pressure.—*USN SAM.*

622. Heggeness, Franklin W. (U. Rochester School Medicine) **Metabolic factors in food intake and utilization in weanling rats.** In Morley R. Kare & Bruce P. Halpern (Eds.), *The physiological and behavioral aspects of taste* (see 37: 256). Pp. 104-109.—Weanling rats fed high carbohydrate diets showed a metabolic rate "elevated approximately 20 per cent above predicted values for the first week of feeding. The results of further studies of this metabolic response suggest that it is associated with a limited capacity for lipogenesis."—E. Y. Beeman.

623. Heller, J. **The influence of the nervous system on renal function: VI. Changes in renal function in unconditioned and conditioned elevation of bile secretion in the dogs.** *Physiol. Bohemoslov.*, 1961, 10(5), 427-431.—The urine flow, clearance of "endogenous" creatinine, and sodium and potassium excretion were measured in dogs with biliary and ureteral fistulas and a denervated left kidney, during unconditioned and conditioned elevation of bile secretion. No change in renal function occurred during unconditioned elevation of bile secretion induced by the peroral administration of phenylbutylcarbinol. During the conditioned increase in bile secretion, renal function showed a slight decrease which was not statistically significant. Denervation of the kidney had no basic effect.—*Journal abstract.*

624. Heller, J. (Charles U., Prague, Czechoslovakia) **Some changes in the urine and blood of dogs during conditioned water, osmotic and mercury diuresis.** *Physiol. Bohemoslov.*, 1961, 10(6), 510-521.—Conditioned water, osmotic, and mercury diuresis "were elaborated in dogs with ureteral fistulae and a denervated left kidney. . . . In every case polyuria was less and of shorter duration in conditioned diuresis. Conditioned water diuresis differs from unconditioned diuresis by an increase in the sodium, potassium and urea concentration in the urine." Changes in the blood are the same in both diuresis. Conditioned osmotic and mercury diuresis differ from the unconditioned by a reverse change in the urine potassium concentration. "Denervation of the kidney had no effect." The composition of the urine was the same in all 3 conditioned diureses.—E. Y. Beeman.

625. Jakoubek, B. **Changes of the ascorbic acid content in adrenal glands and of locomotor activity during the preparatory reaction.** *Physiol. Bohemoslov.*, 1961, 10(6), 534-541.—Using rats, periods of waiting for nociceptive stimuli were compared with periods of being in a new environment. "During the first 3 conditionings, there is a decrease in ascorbic acid levels during the preparatory period to nociceptive stimulation, as well as to muscular activity; the unconditioned stimulus itself does not cause any further changes in ascorbic acid levels. A similar reduction, however, was observed after 60 min. stay in the conditioning cage only. There is no decrease in ascorbic acid levels during the preparatory period on further conditioning, the decrease is present, however after application of the nociceptive stimulus. When animals are placed in the cage only without any additional stimulation, the decrease persists. Following 14 conditioning sessions the levels of ascorbic acid do not decline either in the course of the preparatory period to nociceptive stimulation or to muscular activity, or after application of nociceptive stimulation. The decrease of ascorbic acid fol-

lowing muscular activity, however, is preserved. From the third conditioning session onwards, a conditioned emotional reaction appears being accompanied by a marked reduction in locomotor activity during the first 10 min. of the preparatory period."—*E. Y. Beeman.*

Paris*, 1962, 54, 322-323.—A study on female Swiss mice shows that 0.25-1.0 mg/kg/day reserpine depresses growth, as measured both by weight and size. The effect is not a specific one, but is secondary to decreased food intake caused by the drug.—*C. J. Smith.*

640. Feinberg, Irwin. (National Inst. Health, Bethesda, Md.) A comparison of the visual hal-

lucinations in schizophrenia with those induced by mescaline and LSD-25. In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 64-73.—19 schizophrenic patients who had experienced visual hallucinations were given a questionnaire "designed to elicit the essential features of the drug syndromes." The major differences between the visual hallucinations of these patients and those reported to occur in the mescaline-LSD syndrome are: (a) those of schizophrenics appear suddenly, without prodromata; (b) those in schizophrenia "occur in a psychic setting of intense affective need or delusional preoccupation"; (c) schizophrenic hallucinations are usually imposed on a normal visual environment, while drugs produce diffuse distortions of the existing visual world; and (d) "schizophrenic hallucinations are generally seen with the eyes open, drug induced hallucinations are most readily seen with closed eyes or in darkened environment." Possibilities are reviewed concerning the relative rarity of visual hallucinations in schizophrenia.—J. B. Thompson.

641. Ferster, C. B., Appel, J. B., & Hiss, R. A. (Indiana U. Medical Center) The effect of drugs on a fixed-ratio performance suppressed by a pre-time-out stimulus. *J. exp. Anal. Behav.*, 1962, 5(1), 73-88.—"Pecking was reinforced by a fixed-ratio schedule with food, and responses during a red light produced a time out. If the bird did not respond during the red light, the light terminated and the bird could complete the FR schedule of positive reinforcement uninterrupted. . . . In general, the pre-time-out stimulus suppressed responding more when the FR schedule was large than when it was small. The occurrence of the pre-time-out stimulus in the fixed ratio produced FR strain and extreme curvature atypical of normal fixed ratios of this size. Amobarbital, pentobarbital, chlorpromazine, and d-amphetamine injected when the FR performance was strained by the pre-time-out procedure marked increases in responding." (17 ref.)—*Author abstract*.

642. Frankenhaeuser, Marianne, & Järpe, Gundla. Psychophysical reactions to infusions of a mixture of adrenaline and noradrenaline. *Scand. J. Psychol.*, 1962, 3(1), 21-29.—Psychophysiological reactions to a mixture of adrenaline and noradrenaline (average dose $6.99 \pm 6.99 \mu\text{g}/\text{min}$) given as a continuous intravenous drip for periods of about 40 min. were studied in 11 Ss. Control data were obtained from placebo infusions. The catecholamine infusions produced marked subjective and overt symptoms as well as changes in heart rate and blood pressure. These reactions were, on the whole, similar to those produced by infusions of adrenaline only. Time experience was also affected by the catecholamines in that more was retained of the previously perceived time intervals.—*Journal abstract*.

643. Gonzales, R. C., & Ross, Sherman. (Bryn Mawr Coll.) The effects of chlorpromazine on the course of discrimination-reversal learning in the rat. *J. comp. physiol. Psychol.*, 1961, 54, 645-648.—In a Lashley jumping apparatus a series of discrimination reversals was given to rats receiving chlorpromazine injections and to a control group. For half of each group the problem was a visual discrimination; for the remainder a spatial problem was used. Some of the controls, but none of the drug group, adopted rigid position fixations on the visual problem. In both problems, the drug group reached a

lower error-per-reversal asymptote. The possibility that the drug acts upon the disrupting effect of punishment is discussed.—W. A. Wilson, Jr.

644. Gonzales, R. C., & Shepp, Bryan. (Bryn Mawr Coll.) The effects of chlorpromazine on instrumental learning based on conditioned fear. *Canad. J. Psychol.*, 1962, 16(1), 64-71.—Chlorpromazine was administered to 1 of 2 experimental groups of rats from the outset of a series in which light and tone together were paired with shock. No response could terminate the shock. After the training series the CS was presented repeatedly without shock, and an escape response was instrumental in ending the CS. Only the group which had not received the drug gave evidence of learning. Whether the drug impaired "fear conditioning" or reduced acquired fear was tested in a 2nd experiment in which the time of introduction of the drug was varied. When given subsequent to "fear conditioning" chlorpromazine still inhibited learning, evidence that it reduced acquired fear.—R. S. Davidson.

645. Hehman, K. N., Vonderahe, A. R., & Peters, J. J. (Xavier U.) Effect of serotonin on behavior, electrical activity of the brain, and seizure threshold of the newly hatched chick. *Neurology*, 1961, 11, 1011-1016.—Earlier investigators stated that "central pharmacological effects of serotonin are difficult to evaluate because the quantities which cross the blood-brain barrier after parenteral administration are too small to permit chemical detection." The newly hatched chick was selected as the experimental animal because its blood-brain barrier is not yet fully developed. 300 chicks between 2 and 6 days after hatching were used. Low doses of serotonin, injected intraperitoneally, produced ataxia, decreased muscle tone and motor activity, and stupor. Electrical activity increased in amplitude of the slow waves with a diminution to complete elimination of the low-voltage, fast-frequency background activity. Auditory and tactile stimuli evoked an immediate arousal reaction. Depression of the reticular activating system was advanced as the basis for these effects. Higher doses of serotonin produced positive spike potentials, similar to the 14-per-second and 6-per-second positive spike potentials of autonomic epilepsy. In sufficiently high doses, serotonin causes a clonic convulsion which is usually followed by death.—R. Gunter.

646. Hudspeth, W. J., & Thomson, C. K. (San Jose State Coll.) A further study of the facilitative effect of 5-7-diphenyl-1-2-diazadamantan-6-ol (1757 I.S.) on maze learning. *Psychol. Rep.*, 1962, 10(1), 222.—10 rats injected with 1757 I.S. solution 30 sec. after each maze trial made significantly fewer errors than 10 control rats injected with a neutral solution.—B. J. House.

647. Irwin, Samuel. Drug screening and evaluative procedures. *Science*, 1962, 136(3511), 123-128.—Current approaches do not provide the information needed for properly predicting drug effects in man.—*Journal abstract*.

648. Kirkham, J., Goldstone, S., Lhamon, W. T., Boardman, W. K., & Goldfarb, J. L. Effects of alcohol on apparent duration. *Percept. mot. Skills*, 1962, 14, 318.— $\frac{1}{2}$ of the Ss reported that time appeared to "drag" and a depressed affect, while the other $\frac{1}{2}$ reported acceleration and euphoria. It was suggested that Ss with depressed affect also had de-

creased SEP, but the number was too small for statistical treatment. The lack of a consistent effect of alcohol upon time judgment conforms to the finding of Laties and Weiss. Future studies should consider individual tolerance and type of affective response.—*W. H. Guertin.*

649. Kobayashi, Tsukasa. Drug administration to cerebral cortex of freely moving dogs. *Science*, 1962, 135(3509), 1126-1127.—A method is described to implant a permanent indwelling polyethylene tube venting to the surface of the cerebral cortex of the dogs. Morphine, amobarbital, or imipramine was administered through the tube, and behavioral changes were observed in unanesthetized and unrestrained animals. The results are different from those occurring after intraventricular injection.—*Journal abstract.*

650. Krus, D. M., & Wapner, S. Effect of LSD on pace of performing a variety of tasks. *Percept. mot. Skills*, 1962, 14, 255-259.—The effect of LSD on the pace of performing 6 routine tasks was assessed in a group of 12 males and 12 females. It was found that, under LSD, pace of card "dealing," handwriting, and addition was slower in comparison to a placebo condition; pace of tapping and of drawing lines alternately over and under a series of dots were not significantly different under LSD as compared to placebo. Significant interactions of sequence by conditions were found in 5 of the 6 conditions. This latter result was discussed as reflecting the influence of cognitive attitudes and expectancies on speed of performance.—*W. H. Guertin.*

651. McDonald, R. L., & Gynther, M. D. (Medical Coll. South Carolina) Effects of verbal stimuli on autonomic responsivity of medicated and nonmedicated schizophrenics and character disorders. *J. gen. Psychol.*, 1962, 66, 287-299.—The purpose of this study was to assess the differential effects of compazine and equanil on the heart rate, PGR reactivity and recovery time, and respiratory reactivity of schizophrenics and character disorders under emotion-provoking stimulus conditions. 36 white male hospitalized patients, $\frac{1}{2}$ schizophrenic, $\frac{1}{2}$ character disorders, were randomly divided into nonmedicated, equanil, and compazine groups. Medicated patients received standard dosages (equanil-400 mg. tid; compazine-10 mg. tid) for 3-4 days prior to testing. Stimuli were 12 incomplete sentences, selected to represent conflict areas for these diagnostic categories. The results generally supported the hypothesis that compazine reduces the intensity of ANS reaction to anxiety-provoking stimuli more effectively than equanil; but the verbal stimuli did not elicit the differential physiological reactivity between schizophrenics and character disorders presumably associated with mother relations, guilt feelings, authority figures, and the early family constellation.—*Author abstract.*

652. McGeer, Patrick L. (U. British Columbia) Mind, drugs and behavior. *Amer. Scientist*, 1962, 50, 322-338.—A discussion of recent advances in neurophysiology, neuropharmacological studies, and neurochemical investigations indicates their significance in the growing concepts of mind-brain relationships. Although discoveries in these fields give little insight into how creative thinking and decision making occur in the brain, they do give an inkling of how the motivations for such things are provided,

and how they may be modified. (18 ref.)—*M. Benton.*

653. Malitz, Sidney; Wilkens, Bernard, & Esecover, Harold. (Columbia U.) A comparison of drug-induced hallucinations with those seen in spontaneously occurring psychoses. In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 50-61.—100 chronic schizophrenics showed a 50% incidence of auditory hallucinations and 9% incidence of visual hallucinations. These hallucinations could often be classified as having a positive or negative adaptive value. 86 nonhallucinating patients and volunteers were given LSD, MLD, and ALD. The predominant hallucinatory response was visual, predominantly abstract images. "Use of Phenothiazine blocking agents was associated with a transient increase in restlessness . . . [and] with intensified visual hallucinations . . . symbolic of the affect produced by the unpleasantness of the experience."—*J. B. Thompson.*

654. Marrazzi, Amedeo S. (U. Pittsburgh) Pharmacodynamics of hallucination. In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 36-49.—A review of some experimental data in support of the hypothesis that exogenous and endogenous hallucinogens act by means of synaptic inhibition. It is suggested that this inhibition may result in the dissociation of the primary receiving area and the association area for a given sense modality and consequent "failure of adequate reality checking." (21 ref.)—*J. B. Thompson.*

655. Mirsky, A. F., & Cardon P. V. (National Inst. Health, Bethesda, Md.) A comparison of the behavioral and physiological changes accompanying sleep deprivation and chlorpromazine administration in man. *EEG clin. Neurophysiol.*, 1962, 14, 1-10.—Attentive behavior and changes in EEG, finger plethysmogram, and respiration were studied simultaneously in 8 normal Ss under the influence of sleep loss or chlorpromazine. Both sleep deprivation and chlorpromazine produced marked impairment in performance. Errors in the sleep deprivation condition were associated with slowing of EEG, increased respiratory cycle length and increased finger pulse amplitude. In the chlorpromazine condition, physiological accompaniments of performance were less marked. EEG appeared to be the least accurate physiological measure in reflecting variations in alertness.—*L. C. Johnson.*

656. Nash, Harvey. (Northwestern U.) Psychological effects of amphetamines and barbiturates. *J. nerv. ment. Dis.*, 1962, 134(3), 203-217.—240 male inmates of a penitentiary served as Ss in a double-blind experiment to determine the effect of amphetamines and barbiturates on intellectual tasks. It was found that "amphetamines exert rather uniformly positive effects on a wide range of measures." There was an easier flow of associations under barbiturates but the dose was too small to effect statistically significant results.—*N. H. Pronko.*

657. Segal, Evalyn F. (Walter Reed Army Inst. Research) Effects of dl-amphetamine under concurrent VI DRL reinforcement. *J. exp. Anal. Behav.*, 1962, 5(1), 105-112.—Three adult, food-deprived rats were given IP injections of dl-amphetamine sulfate under DRL and concurrent VI DRL reinforcement schedules. . . . These results

imply that the primary behavioral effect of di-amphetamine was a motor excitatory one. The drug's disruption of timing behavior was not due to a derangement of internal timing mechanisms, nor to interference with the topography or pattern of behavior. Rather, it might be a secondary result of the accelerated emission of overt behavior patterns mediating the temporal spacing of DRL bar presses." (30 ref.)—*Author abstract*.

658. Shteinberg, A. D. Vliyanie snotvorn'ikh i ikh kombinatsy s pentaminom na vneshnee tormozhenie uslovnikh polozhntel'n'ikh pishchev'ikh refleksov. [The effect of somniferous agents and their combinations with pentamine, a ganglioblocking preparation, on the external application of positive conditioned alimentary reflexes.] *Farmakol. Toksikol.*, 1961, 24(4), 397-403.

659. Singer, Jerome Everett. (U. Minnesota) The effects of epinephrine, chlorpromazine, and dibenzylamine upon the flight responses of rats under stress and non-stress conditions. *Dissert. Abstr.*, 1961, 22(1), 318-319.—*Abstract*.

660. Singh, S. D. Effects of stimulant and depressant drugs on physical persistence. *Percept. mot. Skills*, 1962, 14, 270.—The effects of a stimulant and a depressant on Ss' persistence on a physical task. The depressant significantly increased and the stimulant slightly decreased persistence scores as measured by holding a hand dynamometer.—*W. H. Guertin*.

661. Singh, S. D., & Singh, V. The effect of stimulant and depressant drugs on the latency of autokinetic illusion. *Acta psychol., Amsterdam*, 1961, 18(5), 354-359.—Stimulant, depressant, and placebo treatments were administered to 30 students, who, after 1 hour, were tested for autokinetic latency. The latency was significantly decreased by the depressant drug, and increased by the excitant drug. The results support the cortical satiation theory of autokinetic illusion. Only the effect of the depressant drug was found to be positively and significantly correlated with the extraversion scores of the Maudsley Personality Inventory.—*G. Rubin-Rabson*.

662. Sinitsin, L. N. Vliyanie anal'getikov na reaktivn'ie potentsnal'i afferentn'ikh sistem golovnogo mozga. [The effect of analgetics on reactive potentials of afferent systems of the brain.] *Farmakol. Toksikol.*, 1961, 24(3), 259-267.

663. Steiner, W. G., & Himwich, H. E. (Thudichum Psychiatric Research Lab.) Central cholinolytic action of chlorpromazine. *Science*, 1962, 136(3519), 873-874.—Chlorpromazine was found to have an antagonistic action against the electroencephalographic (EEG) alerting produced in rabbits by cholinergic agents, particularly eserine salicylate and acetylcholine chloride. This cholinolytic action occurs at a preoptine, precolicular level where adrenergic agents fail to elicit EEG alerting. These results emphasize the importance of cholinergic mechanisms in EEG alerting.—*Journal abstract*.

664. Uhr, L., Clay, Margaret; Platz, A., Miller, J. G., & Kelley, E. L. (U. Michigan) Effects of meprobamate and prochlorperazine on positive and negative conditioning. *J. abnorm. soc. Psychol.*, 1961, 63(3), 546-551.—The comparative effect of 2 tranquilizing drugs (miltown and thorazine) upon conditioning in normal adults was investigated.

Conditioning involved GSR to a noxious (shock) and positive (sexually stimulating picture) stimulus. Both tranquilizers were observed to be ineffective in affecting classical conditioning procedures when the noxious UCS was used. Only miltown effected conditioning in the predicted direction when the positive UCS was used. The results are related to the differential effect of each tranquilizer upon the nervous system.—*G. Frank*.

665. Waller, Marcus B., & Waller, Patricia F. (Roscoe B. Jackson Memorial Lab.) Effects of chlorpromazine on appetitive and aversive components of a multiple schedule. *J. exp. Anal. Behav.*, 1962, 5(2), 259.—"A multiple schedule having both an appetitive and an avoidance component was maintained in two dogs to create a complex behavioral base line for observing the effects of chlorpromazine. Both soluble and 'Spansule' chlorpromazine generated similar functions relating drug dose to measures of behavioral output. . . . There was no evidence that chlorpromazine had a differential depressing effect as a function of type of reinforcement. . . . These results are discussed with reference to some of the logical and experimental difficulties inherent in making comparisons across components of a multiple schedule and across schedules in general."—*Author abstract*.

666. Weiss, Arthur J., Mancall, Elliott L., Koltes, John A., White, Joseph C., & Jackson, Laird G. (Jefferson Medical College Hosp., Philadelphia, Pa.) Dimethylacetamide: a hitherto unrecognized hallucinogenic agent. *Science*, 1962, 136(3511), 151-152.—Dimethylacetamide in large doses was found to be a potent hallucinogenic drug in the human. Characteristic electroencephalographic changes accompanied the clinical abnormalities.—*Journal abstract*.

667. Weiss, Bernard, & Laties, Victor G. (Johns Hopkins U.) Enhancement of human performance by caffeine and the amphetamines. *Pharmacol. Rev.*, 1962, 14, 1-36.—The relevant literature is reviewed under the following headings: physical endurance and capacity, motor coordination and control, monitoring, learning, simple and complex verbal and arithmetic tasks. The effects on mood and judgment are also surveyed. The authors' discussion takes up 2 main issues: (a) Can caffeine and the amphetamines actually produce superior performance or do they merely restore to a normal level performance degraded by fatigue, boredom, or other influences? (b) Are the performance-enhancing effects of these drugs counterbalanced by untoward effects to such an extent that their practical use is not feasible or desirable? (118 ref.)—*Author abstract*.

668. Wendt, G. R., Cameron, Jean S., & Specht, Priscilla G. (U. Rochester) Chemical studies of behavior: VI. Placebo and dramamine as methodological controls, and effects on moods, emotions and motivations. *J. Psychol.*, 1962, 53(2), 257-279.—Changes in moods, emotions and motivations after drug and placebo were obtained by use of Adjective Check Lists in 4 studies (total N = 112). Placebo effects were successfully eliminated and the random character of the changes in 130 adjectives was shown by $r = -.07$ to $+.05$ for the correlation of the changes between repeat administrations of placebo. Changes after dramamine in 6

determinations were pronounced and consistent, indicated by $r = +.92$ between the changes in 130 adjectives on repeat administrations of the drug. Dramamine was sedative at 100 mg., tranquilizing at 50. —*Author abstract.*

669. Wenzel, Bernice M. (U. California, Los Angeles) Changes in heart rate associated with responses based on positive and negative reinforcement. *J. comp. physiol. Psychol.*, 1961, 54, 638-644.—Cats were trained to press the appropriate bar for food or to avoid shock, using 2 tones as CSs; heart rate (HR) increased during the food CS and decreased during the shock CS. These HR responses to tone were not found outside of the experimental situation. The effects of reserpine were to reduce the HR response to the food CS, and to diminish the bar-press response to the shock CS. "Either reserpine . . . interrupts whatever mechanism intervenes between the heart and the skeletal musculature, or . . . classically conditioned changes in HR do not mediate instrumental avoidance responses."—*W. A. Wilson, Jr.*

ENVIRONMENTAL EFFECTS

671. Cronholm, Börje; Eriksson, Ingrid, & Lindgren, S. Åke. (Karolinska Sjukhuset, Stockholm, Sweden) Memory and concentration performances after protracted occupational exposure to carbon monoxide. *Acta psychiat. Scand., Copenhagen*, 1961, 37(2), 127-142.—"The test battery comprised three memory tests: the 30 word pair, the 30 figure and the 30 personal data tests, a cancellation test, and a Swedish modification of the Wechsler-Bellevue Intelligence scale, the CVB scale. The level of exposure of the workers was rather low. In 22 cases it was relatively high, in 38 cases relatively low, and in the remaining 44 cases that could be paired off with workers with another type of shift work only, it was varying. There were no significant differences in the memory tests or the cancellation tests between exposed and non-exposed groups. The only significant difference found was that the IQ was significantly lower in the exposed group of shift workers than in the non-exposed group of day workers. The same difference was found, however, when 24 non-exposed shift workers were paired off and compared with as many non-exposed day workers."—*R. Kaelbing.*

672. Reynolds, Herbert H., Grunzke, Marvin E., & Rohles, Frederick H., Jr. The effects of exposure to simulated launch and re-entry profiles on chimpanzee performance. *USAF ARL tech. docum. Rep.*, 1962, No. 62-1. 15 p.—5 chimpanzees trained to perform a continuous avoidance task were exposed to the acceleration profiles simulating the conditions of launch and re-entry which exist when a capsule is placed into orbit. Performance during launch and re-entry differed from the base-line period which immediately preceded each of the 3 launches. However, performance immediately following launch and re-entry indicated that the animals recovered rapidly and tolerated the insults well.—*USAF ARL.*

Radiation

673. Arbit, Jack. (Northwestern U. Medical School) Emotionality and avoidance conditioning to X radiation. *J. comp. physiol. Psychol.*, 1961, 54, 653-657.—The preference of rats for a black box or a white box was measured before and after the animals received training trials consisting of confinement to the black box paired with X irradiation, and confinement to the white box without irradiation. Emotionally reactive animals spent less time in the black box than nonreactive animals before training, and only reactive animals showed a decrease in black box preference after irradiation. It was concluded that radiation produces an increment to the inherent drive level.—*W. A. Wilson, Jr.*

674. Furchtgott, E. (U. Tennessee) Comment on "Prenatal Anoxia and Irradiation: Maternal-Fetal Relations." *Psychol. Rep.*, 1962, 10(1), 115-118.—Experimental evidence is reviewed which fails to support Meier's hypothesis that the previously reported behavioral changes in prenatally irradiated rats are due to secondary effects.—*B. J. House.*

675. Levinson, B. (U. Buffalo) Comment on Meier's "Prenatal Anoxia and Irradiation: Maternal-Fetal Relations." *Psychol. Rep.*, 1962, 10(1), 173-174.—A discussion of evidence relevant to Meier's theory of maternal influence in radiation damage.—*B. J. House.*

676. Scarborough, Barron B., & Addison, Robert G. (Florida State U.) Conditioning in fish: Effects of X-radiation. *Science*, 1962, 136(3517), 712-713.—Fish were subjected to different levels of high intensity X radiation to ascertain the effects of X rays on acquisition and retention of conditioning. Lethal dosages were also determined. Light was the conditioned stimulus, and electric shock the unconditioned stimulus. Responses were forward darting and backward swimming movements accompanied by increased gill movement. Acquisition of conditioned responses was suppressed by higher dose levels.—*Journal abstract.*

677. Weckin, Stanley; Elder, Riley F., Jr., & Furchtgott, Ernest. (U. Tennessee) Motor performance in the rat as a function of age and prenatal X irradiation. *J. comp. physiol. Psychol.*, 1961, 54, 658-659.—Ability to climb an inclined plane was studied in rats of 4, 15, or 20 months of age. Age was inversely related to climbing ability, and rats that had been irradiated in utero were inferior to controls, but the interaction was not significant.—*W. A. Wilson, Jr.*

Stress

678. Aiken, L. R., Jr. (U. North Carolina) Stress and anxiety as homomorphisms. *Psychol. Rec.*, 1961, 11, 365-372.—An outline of a proposal to define stress reactions in terms of physicochemical, motor, and ideational components. The term "stressors" is given to those stimuli or patterns thereof "which are reliably and contiguously precedent" to the above reactions for any given organism. Stress is a 2nd-order concept applied to stressor-stress reaction sequences. Anxiety is considered as a variety of stress with the term "anxior" for stimulus and "anxiety reaction" for response. Programs of research should proceed toward the end of adequately delimiting these concepts within the proposed context.—*R. J. Seidel.*

679. Bharucha-Reid, Rodabe P. (U. Oregon) **The internal modulating system and stress: A neurophysiological model.** *J. gen. Psychol.*, 1962, 66, 147-158.—This deals critically with theories and experiments relating to disorganization-organization effects of stress (sensory deprivation) and emotions. The hypothesis is presented that whether an emotional state, or stress, eventuates in disorganized or organized behavior will depend on the role of an internal modulating system (IMS). The IMS is described within the framework of a neurophysiological "model" which shows (a) how disorganization-organization can take place either within a specific sense modality or in general; (b) how between individuals and within individuals, differences to stress stimuli may be explained on the basis of threshold, change, and rate of change of stimulation and the nonlinear relationship between stress and disorganization; (c) how stress may replicate the action of pharmaceutical anesthetics so that stress operates as a "behavioral anesthetic" and the blockage of input is either partial or complete; and (d) the psychophysiological data that the brain stem and thalamic reticular system prepotency is responsible for organized and disorganized behavior, respectively.—*Author abstract.*

NUTRITION

GENETICS & BEHAVIOR

680. David, Paul R., & Snyder, Laurence H. (U. Oklahoma) **Some interrelations between psychology and genetics.** In Sigmund Koch (Ed.), *Psychology: A study of a science. Vol. 4* (see 37: 93). Pp. 1-50.—After presenting an introduction to the scope of genetics and the principles of gene action the essay discusses the interrelations of genetics and differential, abnormal, and comparative psychology, summarizing relevant research. Methodological aspects are discussed with the suggestion that a major rapprochement can be made between genetics and abnormal psychology by shifting the focus to the family rather than the individual as a unit of study. (212 ref.)—*E. Y. Beeman.*

681. Dunn, L. C. (Columbia U.) **Cross currents in the history of human genetics.** *Amer. J. hum. Genet.*, 1962, 174(1), 1-13.—In this historical review the connections between eugenics and human genetics are traced. Eugenics as conceived by Galton emphasized positive traits, but soon the movement became more concerned with mental deficiency and other types of (undesirable) abnormalities. Lack of understanding of the implications of Mendel's work led to a split between "Mendelians" and "Biometricians." Modern eugenic proposals such as those of H. J. Muller are still to be viewed with caution and scepticism. While the biometrical tradition is merging with the main stream of human genetics, the possibilities for sound social action based on knowledge of human genetics are still limited, and recent experiences in Germany show the risks of legislative ventures into eugenics.—*S. G. Vandenberg.*

682. McClearn, Gerald D. (U. California, Berkeley) **Genotype and mouse activity.** *J. comp. physiol. Psychol.*, 1961, 54, 674-676.—"Mice of the C57BL/Crgl and A/Crgl inbred strains, and of the F₁, F₂, and backcross generations derived from these

strains were tested for locomotor activity. A clear relationship is shown between activity and the percentage of C57BL genes present. Estimates are made of the degree of genetic determination of the F₂ variance, and dominance, preponderantly in the direction of higher activity, is shown."—*W. A. Wilson, Jr.*

683. McGauch, J. L., Jennings, R. D., & Thomson, C. W. (San Jose State Coll.) **Effect of distribution of practice on the maze learning of descendants of the Tryon maze bright and maze dull strains.** *Psychol. Rep.*, 1962, 10(1), 147-150.—"Rats from the Tryon S₁ (maze bright) and S₈ (maze dull) strains were given five rewarded trials in a Lashley III alley maze. Different sub-groups were trained with inter-trial intervals of 30 sec., 5 min. or 1 day. The S₈ Ss were inferior to the S₁ Ss only in the 30-sec. inter-trial interval condition." Results are discussed in terms of neural consolidation.—*B. J. House.*

684. Sheba, C., Ashkenazi, I., & Szeinberg, Aryeh. (Government Hosp., Tel Hashomer, Israel) **Taste sensitivity to phenylthiourea among the Jewish population groups in Israel.** *Amer. J. hum. Genet.*, 1962, 14(1), 44-50.—Taste thresholds for phenylthiourea were measured in several Jewish communities in Israel. The total number of Ss examined was 1687. The highest frequencies of nontasters were found among 41 Jews from Cochín (31%) and 41 from the Island of Gerba on the Tunisian coast of the Mediterranean (41%). A close similarity of taste distribution was observed among 213 females from Eastern Europe (Ashkenazic); 60 from the Balkan countries (non-Ashkenazic); 65 from Kurdistan; 169 from Iraq and Persia; 166 from Algeria, Tunisia, Morocco and Tripolitania; and 129 from Yemen (15%-20% of nontasters). Significant differences were found between 227 European males (21%-27% of nontasters) and those from North Africa (n = 174), Iraq and Persia (n = 169, 11%-13% of nontasters).—*S. G. Vandenberg.*

685. Sutton, H. E., Vandenberg, S. G., & Clark, P. J. (U. Michigan) **The hereditary abilities study: Selection of twins, diagnosis of zygosity and program of measurements.** *Amer. J. hum. Genet.*, 1962, 14(1), 52-63.—The organization of a study of 45 pairs of identical and 37 pairs of fraternal twins is described. 6 blood group systems, tested by 12 antisera, were used to establish the twin zygosity. Separate papers will report on the results of anthropometric traits, biochemical measures, cardiovascular studies, ophthalmologic studies, and psychological studies. The blood test results are reported in a table, with the probability of monozygosity for each twin pair.—*S. G. Vandenberg.*

686. Vanderpool, D. L., & Davis, R. T. (U. South Dakota) **Differences in spontaneous behavior among inbred strains of mice.** *Psychol. Rep.*, 1962, 10(1), 123-130.—A method is described for recording spontaneous behavior in terms of pre-selected categories in a device which lessen peripheral stimulation. Data were obtained from 5 Ss from each of 3 strains of mice. Strain differences were found in behavior described as inanimate-object-directed, food-directed, water-directed, olfactory survey, and miscellaneous.—*B. J. House.*

687. Winchester, A. M. (Stetson U.) **Heredity and your life.** New York: Dover, 1960. xii,

333 p. \$1.45 (paper).—A paperback edition of the 1960 revised edition. The 1st edition was published in 1956. 3 chapters ("Nature and Nurture," Heredity and Intelligence," and "Mental Disorders") discuss the more psychologically oriented questions.—*E. Y. Beeman.*

LATERAL DOMINANCE

688. Ghent, Lila. (George Washington U.) Developmental changes in tactual thresholds on dominant and nondominant sides. *J. comp. physiol. Psychol.*, 1961, 54, 670-673.—Pressure sensitivity on the thumb was measured in 108 children from 5 to 11 years of age. Girls had greater sensitivity on the dominant hand at the age of 5, but thereafter the opposite (adult) pattern appeared. For boys, the adult pattern appeared at 11 years; for younger groups, there were no laterality differences. Possible sex differences in perception are discussed.—*W. A. Wilson, Jr.*

689. Weinstein, Sidney, & Sersen, Eugene A. (Albert Einstein Coll. Medicine) Tactual sensitivity as a function of handedness and laterality. *J. comp. physiol. Psychol.*, 1961, 54, 665-669.—Pressure sensitivity of the palms, soles, and forearms was tested in 136 Ss. A majority had greater sensitivity on the left side than on the right, principally among the right-handed Ss. A tendency for the right side to be more sensitive appeared among left-handed Ss with a familial history of sinistrality, especially if the mother was left-handed. Theories of cerebral dominance are discussed.—*W. A. Wilson, Jr.*

ANIMAL PSYCHOLOGY

690. Bliss, Eugene L. (Ed.) *Roots of behavior: Genetics, instinct, and socialization in animal behavior.* New York: Harper, 1962. xi, 339 p. \$16.00.—31 authors contributed to this text of animal behavior. Part I deals with the genetics of behavior, presenting research with many different species. "Part II is devoted to analysis of drive states and instinctual behavior." Sexual, maternal, aggressive, and emotional behaviors are among those considered. Part III is concerned with early experience, including imprinting, infantile stimulation, and social development. "Part IV is devoted to studies of animals as members of groups and societies."—*E. Y. Beeman.*

691. Moment, G. B. (Goucher Coll.) Reflexive selection: A possible answer to an old puzzle. *Science*, 1962, 136(3512), 262-263.—With the color vision and learning abilities of birds and telosts now proved, it appears possible that the hitherto puzzling massive variation in color and pattern of certain species, distributed through at least 5 phyla, is not the result of the mere free play of mutation but represents a protective variation and is the product of what may be called reflexive selection.—*Journal abstract.*

NATURAL OBSERVATION

692. Reese, Ellen P., & Reese, T. W. (Mount Holyoke Coll.) The quail, *Coturnix coturnix*, as a laboratory animal. *J. exp. Anal. Behav.*, 1962, 5(2), 265-270.—Presents a general description of this quail with some experimental findings and concludes that "we believe that *C. coturnix* should prove

a useful experimental animal for comparative studies, for basic research in learning, motivation, and perhaps social behavior, and for teaching the analysis of behavior in demonstrations and laboratory courses."—*J. Arbit.*

693. Yuen, Heeny S. H. (United States Dept. Interior, Honolulu) Bow wave riding of dolphins. *Science*, 1961, 134(3484), 1011-1012.—Dolphins riding bow waves were observed through underwater viewing ports. The postures assumed by the dolphins show that they present their bodies rather than the ventral surfaces of their flukes to the propellant forces of the bow wave.—*Journal abstract.*

EARLY EXPERIENCE (INCLUDING IMPRINTING)

694. Amsel, Abram, & Penick, Elizabeth C. (U. Toronto) The influence of early experience on the frustration effect. *J. exp. Psychol.*, 1962, 63(2), 167-176.—3 variables were manipulated from the birth of 40 hooded rats until the time of testing in a double-runway apparatus: size of litter in which raised, differential frustrative-feeding procedures in a feeding apparatus discriminable from the home environment, and no-food-present vs. food-present-but-inaccessible in the 1st goal box of the runway on nonreward trials. The results are discussed in terms of previous findings and hypotheses regarding the frustration effect.—*J. Arbit.*

695. Bambridge, R. (Queen's U., Kingston, Ontario) Early experience and sexual behavior in the domestic chicken. *Science*, 1962, 136(3512), 259-260.—Newly hatched chickens were imprinted to 1 of 2 moving objects. From the 5th day of life on, the chickens were injected with male sex hormone. When later presented with a choice between the 2 objects, they addressed induced sexual responses to the object to which they were imprinted.—*Journal abstract.*

696. Denenberg, Victor H., & Karas, George G. (Purdue U.) Interactive effects of infantile and adult experiences upon weight gain and mortality in the rat. *J. comp. physiol. Psychol.*, 1961, 54, 685-689.—The effects of infantile handling and adult avoidance training upon body weight and susceptibility to starvation were studied. Handling in the first 20 days of life led to lower weight at 21 days of age; weight at 69 days was a complex function of amount of handling and adult experience. Avoidance learning reduced survival time, but to a lesser extent for rats which had been handled in infancy.—*W. A. Wilson, Jr.*

697. Denenberg, Victor H., Morton, John R. C., Kline, Ned J., & Grotta, Lee J. (Purdue U.) Effects of duration of infantile stimulation upon emotionality. *Canad. J. Psychol.*, 1962, 16(1), 72-76.—With the assumption that infantile handling is stress-producing and tends to reduce responsiveness to later stressful situations, it was hypothesized that "emotionality" in adult rats would be inversely related to amount of handling during the 1st 20 days. In an open field test unhandled rats were significantly less active on Days 77-79 than those handled for the 1st 10 or 20 days. Following shock on Day 80 the 20-day group defecated least, and the unhandled group the most.—*R. S. Davidon.*

698. Denenberg, Victor; Ottinger, Donald R., & Stephens, Mark W. (Purdue U.) Effects of

maternal factors upon growth and behavior in rats. *Child Developm.*, 1962, 33(1), 65-71.—"The purpose of this experiment was to attempt to modify the growth and behavior of rat pups by the experimental manipulation of the mother. Some females were shocked and/or were alternately rotated between their own litter and another litter. It was found that the variable of shocking the mothers resulted in significant emotionality on the part of the offspring in adulthood and reduced body weight after avoidance learning. The rotation variable resulted in significant infantile mortality and reduced weaning weights of the surviving young as well as heightening emotionality following the stress of avoidance learning."—*W. J. Meyer.*

699. Eells, Janet F. (Northwestern U.) Inconsistency of early handling and its effect upon emotionality in the rat. *J. comp. physiol. Psychol.*, 1961, 54, 690-693.—Rats were subjected to 1 of 4 kinds of handling from 15 to 62 days of age. Tests of activity, timidity, etc. at the end of this period disclosed that unhandled controls were the most emotional, and gently handled rats were the least emotional. Rats that were consistently roughly handled, and rats that were petted and mistreated in a random order were near the middle of the range of emotionality, providing no evidence that inconsistent treatment produces the greatest emotional instability.—*W. A. Wilson, Jr.*

700. Harlow, Harry F. (U. Wisconsin) The heterosexual affectional system in monkeys. *Amer. Psychol.*, 1962, 17(1), 1-9.—"We believe that the heterosexual affectional system in the rhesus monkey, like all the other affectional systems, goes through a series of developmental stages—an infantile heterosexual stage, a preadolescent stage, and an adolescent and mature heterosexual stage." Isolation-raised monkeys later displayed severe social abnormalities—a sociopathic syndrome. Monkeys raised with surrogate mothers—rejecting wire frame mothers, air-blast mothers, and infant-shaking mothers—have seldom displayed normal sex behavior. "Month after month female monkeys that never knew a real mother, themselves become mothers—helpless, hopeless, heartless mothers devoid, or almost devoid of any maternal feeling."—*S. J. Lachman.*

701. Hockman, Charles H. (Brown U.) Prenatal maternal stress in the rat: Its effects on emotional behavior in the offspring. *J. comp. physiol. Psychol.*, 1961, 54, 679-684.—Pregnant rats were exposed daily to the presence of a stimulus which had previously been the CS in an avoidance situation. Compared to controls, the "stressed" group had a smaller percentage of live litters. The offspring of the "stressed" group were relatively inactive in an open-field at 30-45 days of age, but only in the subgroup that was raised by foster mothers. Explanations in terms of endocrine activity are offered.—*W. A. Wilson, Jr.*

702. Lindholm, Byron Walter. (U. Illinois) Critical periods and the effects of early shock on later drinking behavior in the white rat. *Dissert. Abstr.*, 1961, 21(11), 3531-3532.—*Abstract.*

REFLEXES & INSTINCTIVE BEHAVIOR

708. Benjamin, Lorna Smith. (U. Wisconsin) Nonnutritive sucking and dental malocclusion in the deciduous and permanent teeth of the rhesus monkey. *Child Developm.*, 1962, 33(1), 29-35.—"The nonnutritive sucking behavior of 10 rhesus monkeys was sampled during late infancy, during the time permanent teeth were appearing, and after permanent front teeth had arrived. The daily measure was the percentage of 10-sec. periods out of a possible 25 during which nonnutritive sucking was observed to occur. Under nembutal anesthesia, dental impressions of deciduous and permanent teeth were taken with Kerr permalastic impression material. Models were made of Castone dental stone. A single measure of malocclusion reflected deviation in the vertical, front-to-back, and left-to-right dimensions. Infantile thumbsucking was found to be significantly correlated with malocclusion shown in both deciduous and permanent teeth."—*W. J. Meyer.*

709. Benjamin, Lorna Smith. (U. Wisconsin) Nonnutritive sucking and the development of malocclusion in the deciduous teeth of the infant rhesus monkey. *Child Developm.*, 1962, 33(1), 57-64.—"To trace the relation of thumbsucking to the development of malocclusion during early infancy, the nonnutritive sucking of 16 monkeys was sampled continuously from birth to 180 days of age. The measure of thumbsucking was the number of 10-sec. periods out of a possible 25 during which nonnutritive sucking was observed to occur." Impressions were taken at birth, 30, 90, and 180 days of age. A significant correlation ($\tau = .50$) between average sucking and average dental displacement was found.—*W. J. Meyer.*

711. Voronin, L. G. et al. (Eds.) *Orientirovochnyi refleks i orientirovochno-issledovatel'skaia deiatel'nost'.* [The orienting reflex and orienting-investigatory activity.] Moscow, USSR: RSFSR Academy Pedagogical Sciences, 1958. 351 p.—The book reproduces the papers read at the conference on

the orienting reflex, held in Moscow in 1957 under the joint sponsorship of the Institute of Defectology and the Departments of Higher Nervous Activity and Psychology at Moscow State University.—*I. D. London.*

MOTIVATION & EMOTION

712. Benjamin, Lorna Smith. (University Hosp., Madison, Wis.) The effect of frustration on the nonnutritive sucking of the infant rhesus monkey. *J. comp. physiol. Psychol.*, 1961, 54, 700-703.—Monkeys were observed from 90 to 165 days of age in a cage which was divided in half by a transparent partition. Experimental monkeys were frustrated by restraining them in one half of the cage while food was visible in the other half. These Ss showed more nonnutritive sucking than controls which never received or saw food in the cage. Difficulties in certain theoretical explanations of the data are discussed.—*W. A. Wilson, Jr.*

713. Bolles, R. C., & De Lorge, J. (Hollins Coll.) Effect of hunger on exploration in a familiar locale. *Psychol. Rep.*, 1962, 10(1), 54.—Latency of leaving home cage was significantly shorter for 23-hr. hungry rats than for ad lib feeders.—*B. J. House.*

714. Broadhurst, P. L. (Inst. Psychiatry, U. London) A note on further progress in a psychogenetic selection experiment. *Psychol. Rep.*, 1962, 10(1), 65-66.—"Data for defecation and ambulation for five additional generations of Maudsley Reactive and Nonreactive strains (163f and 163g) of rats are given."—*B. J. House.*

715. Collier, George, & Willis, Frank N. (U. Missouri) Deprivation and reinforcement. *J. exp. Psychol.*, 1961, 62(4), 377-384.—"The relations between initial and terminal rate of bar pressing and concentration, volume per reinforcement, and interval between reinforcements, were explored as functions of deprivation. The slopes of the initial rate-concentration and initial rate-interval functions were functions of deprivation while the initial rate-volume function was not. The rate of 'shutoff' was most sensitive to deprivation at large concentrations, large volumes, and short intervals. Three independent loci of events controlling food ingestive behavior were suggested: the proximal reinforcing stimuli, the momentary post-ingestive load, and the nutritive state."—*J. Arbitt.*

716. Dufort, Robert H., & Wright, John H. (Wake Forest Coll.) Food intake as a function of duration of food deprivation. *J. Psychol.*, 1962, 53(2), 465-468.—Rats were deprived of food for 0, 12, 24, 36, 48, 72, 96, 120, 144, 168, or 192 hours and tested for food intake during a subsequent 2-hour eating period. Intake increased for deprivations up to 24 hours and then remained relatively constant for the longer deprivation periods. The results were interpreted as supporting the general conclusion that food intake is not a useful measure of the effects of different durations of food deprivation.—*Author abstract.*

717. Isaac, Walter, & Reed, Walter G.* (Emory U.) The effect of sensory stimulation on the activity of cats. *J. comp. physiol. Psychol.*, 1961, 54, 677-678.—The cage activity (light-beam crossings) of Siamese cats was greater in the dark than

in the light, regardless of whether the room was quiet or "noisy." These results for this nocturnal animal are contrasted with the opposite findings in the monkey, a diurnal animal, and the reticular formation is suggested as the site for the influence of sensory input upon activity.—*W. A. Wilson, Jr.*

718. Jacobs, Harry L. (U. Rochester School Medicine) The osmotic postingestion factor in the regulation of glucose appetite. In Morley R. Kare & Bruce P. Halpern (Eds.), *The physiological and behavioral aspects of taste* (see 37: 256). Pp. 16-27.—Data is presented to show that "water intake is primarily affected by deprivation dehydration. Glucose intake is primarily affected by the amount of glucose in the load and is not a function of its osmotic properties." Apparent osmotic effects in earlier experiments were artifactual. Caloric value is suggested as an alternative explanation for these data.—*E. Y. Beeman.*

719. Klopfer, F. D.* (Washington State U.) Threat distance in ovigerous crayfish. *J. comp. physiol. Psychol.*, 1961, 54, 710-712.—Stimulus crayfish of various sizes were allowed to approach ovigerous females until the latter displayed threat behavior. The distance between the crayfish when threat behavior occurred was directly related to the size of the stimulus animal, and inversely related to the size of the S. Control tests showed that the relationship to stimulus size was visually mediated, although threat occasionally occurred when vision was excluded.—*W. A. Wilson, Jr.*

720. McGill, T. E. (Williams Coll.) Reduction in "head-mounts" in the sexual behavior of the mouse as a function of experience. *Psychol. Rep.*, 1962, 10(1), 284.—Observation of 200 matings of 5 strains of mice showed number of headmounts to decrease as a function of number of previous ejaculations.—*B. J. House.*

721. Premack, David, & Schaeffer, Robert W. (U. Missouri) Distributional properties of operant-level locomotion in the rat. *J. exp. Anal. Behav.*, 1962, 5(1), 89-95.—"Four rats had continuous access to activity wheels first, then access for 1 hr per day, and, subsequently, continuous access. Limiting S's access to the wheel substantially increased the total frequency of running. A distributional analysis of response duration, burst duration, and interburst interval showed that the increased frequency arose almost entirely from a shortening of the interval between successive bursts. In contrast, speed of the individual response and number of responses per burst changed only negligibly. If S were running, the probability that it would either stop or continue did not differ appreciably for the conditions of continuous or limited access to the wheel. But if S were not running, the probability that it would start running was appreciably greater for limited than for continuous access."—*Author abstract.*

722. Reese, T. W., & Hogenson, Marilyn J. (Mount Holyoke Coll.) Food satiation in the pigeon. *J. exp. Anal. Behav.*, 1962, 5(2), 239-245.—Attempted to determine the food satiation curves of the pigeon as a function of hours of deprivation or percentage of free-feeding weight, and to study the fluctuation in free-feeding weight as a function of deprivation and satiation. Nearly 64% of the satiation curves were straight with an abrupt stop; 18%

were straight with a curvilinear stop. During the early part of each satiation session the pigeons responded at fairly constant rates or did not respond at all: the critical weight above which they did not respond was 85% of free feeding.—*J. Arbib.*

723. Schiff, William; Caviness, James A., & Gibson, James J. (Cornell U.) Persistent fear responses in rhesus monkeys to the optical stimulus of "looming." *Science*, 1962, 136, 982-983.—The approach of an object corresponds with a spatio-temporal optical stimulus consisting of a symmetrical expansion of a closed contour in the field of view. The visual equivalent of impending collision was isolated and compared with its sequential inversion. Infant and adult rhesus monkeys manifested persistent avoidance responses to "looming" but not to the inverse. This visual stimulus alone is a stronger exciter of avoidance, and the response appears early in life.—*Journal abstract.*

SENSORY PROCESSES

724. Baylor, Edward R., & Shaw, Evelyn. (Woods Hole, Mass.) Refractive error and vision in fishes. *Science*, 1962, 136(3511), 157-158.—The eyes of living immersed herring and silversides are farsighted and require greater hypermetropic correction for lateral vision than for anterior vision. Comparisons of lens-to-retina distances in frozen material with focal lengths of lenses are consistent with the degree of hypermetropia found by retinoscopy.—*Journal abstract.*

koe dokazatel'stvo trikhromazii tsvetovogo zreniia pchelinykh (na primere shmelei). [Colorimetric demonstration of trichromatization of color vision in bees (bumblebees by way of example).] *Biofizika*, 1962, 7(2), 211-217.—The author presents evidence to show that the bumblebee is a trichromat, possessing 3 types of receptors with different spectral sensitivities. But the trichromatic system of color vision in the bumblebee is constructed so that each spectral illumination simultaneously excites basically not more than 2 different receptors. The systems of color vision in the bee and the bumblebee completely coincide with the exception that the long-waved receptor of the bumblebee is more sensitive to red rays.—*I. D. London.*

730. Robinson, John S., & Voneida, Theodore J. (California Inst. Technology) Mask for controlling visual input in cats. *Science*, 1962, 135(3509), 1134.—Analysis of visual function frequently requires control of visual input. The present report describes a mask which can be used for achieving this control in a variety of experimental situations.—*Journal abstract.*

731. Suckling, E. E. (State U. New York, Brooklyn) Lateral line in fish: Possible mode of action. *J. Acoust. Soc. Amer.*, 1962, 34, 127.—"The proposal is made that fish detect low-frequency sounds as 'internal vibrations' rather than as direct oscillations of the water."—*A. M. Small, Jr.*

732. Symmes, David. (Yale U.) Self-determination of critical flicker frequencies in monkeys. *Science*, 1962, 136(3517), 714-715.—5 rhesus monkeys have been successfully trained by operant conditioning techniques to continuously adjust the rate of flicker of an illuminated target above and below what is presumed to be their fusion threshold.—*Journal abstract.*

LEARNING

733. King, William J. (General Dynamics Corp., Groton, Conn.) Continuous compensatory tracking by a Cebus monkey. *Science*, 1961, 134(3483), 947-948.—A Cebus monkey was trained to hold a continuously moving voltmeter needle on-target for 60 sec. to obtain a food pellet reinforcement. The task confronting the animal was relatively complex in that the high-frequency error voltage fed to the voltmeter needle was nulled by the animal by means of a joystick physically separated from the stimulus display.—*Journal abstract.*

734. Mason, William A., & Harlow, Harry F. (Yerkes Lab. Primate Biology) The effects of age and previous training on patterned-strings performance of rhesus monkeys. *J. comp. physiol. Psychol.*, 1961, 54, 704-709.—Performance on patterned-string problems was investigated in 81 monkeys ranging in age from 60 days to adulthood. Learning was shown on all patterns in every age group, and performance generally improved with increasing age. "The perceptual capabilities of rhesus monkeys . . . are not fully developed at one year of age and probably not even at puberty."—*W. A. Wilson, Jr.*

735. Moriguchi, Noritaka. (U. Tokyo) [A study of experimental extinction: I. The effect of extinction of a response system on learning of another response system.] *Jap. J. Psychol.*, 1961, 32(5),

296-302.—The problem studied was whether the experimental extinction of a conditioned lever pressing response, under 3 conditions (Extinction to no response for 40 sec., for 2 min., and for 6 min.), affects the subsequent learning of a running response. Ss were 26 male and 35 female white rats, 6-7 months of age. It was concluded that "a relatively short time extinction in one response neither reduces the response tendency of another response nor inhibits its learning, but rather facilitates the learning of another response," and that this is a result of an increment in the original drive. (English summary) —J. Lyons.

736. O'Connell, Richard Howard. (U. Michigan) Factors affecting the choice-point behavior of the rat: Alternation and stimulus change. *Dissert. Abstr.*, 1961, 21(12), 3863.—Abstract.

737. Thetford, Paul E., & Amsel, Abram. (Menninger Found.) Generalization of reactive inhibition. *Canad. J. Psychol.*, 1962, 16(2), 138-144.—To study the generalization of response decrements, groups of rats were given preliminary training on both linear and circular runways, and were then given 20 massed trials on one or the other, or both (3-14-3). Final running times were significantly higher than initial ones in the test series, a decrement attributed to accumulation of I_R and/or drive reduction. The transfer of decrements from one response to another was taken as evidence that I_R represents relatively central processes, in contrast to Hull's position.—R. S. Davidson.

Conditioning

738. Behrend, Erika R., & Bitterman, M. E. (Bryn Mawr Coll.) Avoidance-conditioning in the goldfish: Exploratory studies of the CS-US interval. *Amer. J. Psychol.*, 1962, 75(1), 18-34.—Another of a continuing series of studies directed toward a comparative psychology of conditioning in the fish and the rat. In this series a suggested difference of the effect of variation in the CS-US interval between the 2 species is reported and examined.—R. H. Waters.

740. Mosidze, V. M., & Kuchava, M. A. K voprosu o parnoi i razdel'noi rabote bol'shikh polusharii golovnogo mozga sobaki. [On joint and separate functioning of the brain in the dog.] *Soobshch. Akad. Nauk Gruz. SSR*, 1962, 28(1), 89-96.—When the skin of one side of a dog is pricked, excitation is registered in both cerebral hemispheres, but more strongly in the contralateral hemisphere. Pricking in combination with a conditioned auditory stimulus produces asymmetry in the salivary responses, particularly suppression of the contralateral conditioned salivary reflex. The conditioned salivary reflex to pricking is formed much more quickly on the ipsilateral than on the contralateral side.—I. D. London.

741. Napalkov, A. V. (Moscow State U.) Fiziologicheskii analiz nekotorykh slozhnykh form povedeniya. [Physiological analysis of some complex forms of behavior.] *Vop. Psikh.*, 1961, No. 6, 136-146.—This article reviews and summarizes a number

of experiments on chaining of reflexes. Chains of reflexes have been established in a variety of species including rabbits, rats, and man. The chains are ordinarily established by a method of successive approximation. Each link consists of a stimulus and a conditioned response finally ending with an unconditioned consummatory or defense reflex. In establishing the chain each stimulus serves as a reinforcer for the preceding response. A chain once established seems to function as a unit. Other experiments include making the operation of a food reinforced chain conditional upon the appearance or disappearance of a discriminable stimulus. This stimulus can then serve as the reinforcement for an additional chain of reflexes. Separation in time of the 2 chains doesn't appear to effect the strength of the latter chain. Reference is further made to use of complex stimuli as conditioned stimuli and omission of components of these stimuli in further experiments. The implications of these results for interpretation of complex systems of behavior are discussed.—H. Pick.

Discrimination

742. Clayton, F. L. (Brown U.) Two measures of the "cue strength" of a stimulus and its conditioned reinforcing value. *Psychol. Rep.*, 1962, 10(1), 231-240.—"Sixteen albino rats were given discrimination training under food deprivation in an operant training box. Panel pushing during S^D (white noise) was reinforced on a VI 15" schedule for one group of eight animals and on a VI 75" schedule for the other group." After training, extinction, and retraining, an attempt was made to condition bar pressing using the S^D as the only reinforcing stimulus. Significant effects were a higher S^D response rate for the VI 75" group during extinction and a higher S^D/S^A ratio for the VI 75" group during discrimination training. No significant evidence for a strong conditioned reinforcer was found.—B. J. House.

743. Falk, J. L., & D'Amato, C. J. (Cancer Research Inst. of N. E. Deaconess Hosp.) Automation of pattern discrimination in the rat. *Psychol. Rep.*, 10(1), 24.—Apparatus and procedure are described for training pattern discrimination in rats with automatic equipment.—B. J. House.

744. Hearst, Eliot. (National Inst. Mental Health) Concurrent generalization gradients for food-controlled and shock-controlled behavior. *J. exp. Anal. Behav.*, 1962, 5(1), 19-31.—Monkeys were trained to press a lever to avoid shock and to pull a chain for a food reward in a bright light condition. Generalization gradients were determined for each response to other light intensities. Additional gradients were obtained after training in a brightness discrimination and under several free-shock conditions. (23 ref.)—J. Arbit.

745. Mackintosh, J. An investigation of reversal learning in octopus vulgaris lamarck. *Quart. J. exp. Psychol.*, 1962, 14(1), 15-22.—18 octopuses were trained by a method of successive discrimination training to discriminate between a vertical and a horizontal rectangle. They were then overtrained for either 20 or 60 trials, after which they learned the reverse discrimination. At the beginning of each reversal they were given 20 trials pretraining on the new positive stimulus. The Ss completed from 2 to

9 reversals. It was found that the amount of overtraining had no effect on the rate of learning the subsequent reversal. The 1st 4 reversals all took significantly longer to learn than the original problem, but did not differ significantly from one another. However, examination of the raw data suggests that later reversals do take longer to learn. The performance when learned (i.e., on the 1st day of overtraining) was as good after reversal learning as after the learning of the original problem. The results do not show definite signs that could be interpreted as an exhaustion of a limited supply of neurones available for learning.—*Journal abstract.*

746. Pierrel, Rosemary, & Sherman, J. Gilmour. (Barnard Coll.) **Generalization and discrimination as a function of the S^D - S^A intensity difference.** *J. exp. Anal. Behav.*, 1962, 5(1), 67-71.—3 groups of 4 rats each were trained on an auditory-intensity discrimination for 21 days. The S^D - S^A difference was different for each of the groups. Following this discrimination training the animals were tested for generalization of the bar-press response to 7 novel S^A 's which were presented intermingled with the original S^D and S^A values. Generalization gradients exhibit a maximum displaced from S^D in a direction also away from S^A . Additional results are also discussed.—*J. Arbit.*

Avoidance

747. Azrin, N. H., Holz, W. C., & Hake, D. (Anna State Hosp., Ill.) **Intermittent reinforcement by removal of a conditioned aversive stimulus.** *Science*, 1962, 136(3518), 781-782.—"Brief electric shocks were delivered [to squirrel monkeys] at irregular time intervals but only while a light was on. A response was reinforced on a ratio schedule by the termination of the light. This method produced a high rate of response quite similar to that produced by a comparable schedule of food reinforcement."—*E. L. Borrowman.*

748. Baron, Alan, & Antonitis, Joseph J. (U. Maine) **Punishment and preshock as determinants of bar-pressing behavior.** *J. comp. physiol. Psychol.*, 1961, 54, 716-720.—Unconditioned bar pressing was studied in 4 groups of mice. The groups were determined by whether or not Ss received a series of unavoidable preshocks, and whether or not they were given shocks for bar pressing on the first 2 days of tests. Preshock depressed bar pressing in the not-punished groups, but produced higher response levels in the punished animals. "The findings support the hypothesis that exposure to aversive stimulation results in an adaptive process which reduces the emotionalizing and depressing effects of such stimulation on later occasions."—*W. A. Wilson, Jr.*

749. Brethower, Dale M., & Reynolds, G. S. (Harvard U.) **A facilitative effect of punishment on unpunished behavior.** *J. exp. Anal. Behav.*, 1962, 5(2), 191-199.—2 pigeons pecked keys on a variable-interval schedule during the presentation of each of 2 stimuli. At different times punishment followed every response emitted in the presence of one of the stimuli. Generally, when the rate of punished responding changed during the presentation of one stimulus, the rate of unpunished responding during the other stimulus changed in the opposite direction. This is called behavioral contrast. The effects of dif-

ferent programs are discussed as well as extinction and no punishment.—*J. Arbit.*

750. Dinsmoor, James A. (Indiana U.) **Variable-interval escape from stimuli accompanied by shocks.** *J. exp. Anal. Behav.*, 1962, 5(1), 41-47.—Conventional techniques for studying conditioned aversive stimulation separate the procedure for testing the stimulus from the procedure for making it aversive. In measuring the effectiveness of the stimulus, tests can be conducted only during the process of decline from a previous level. The present report is of a technique for measuring conditioned aversive stimulation that is continually maintained in effectiveness by further pairing with shock. Thus, continued measurement of a stable state is possible over an extended period of time.—*J. Arbit.*

751. Elder, T., Noblin, C. D., & Maher, B. (Louisiana State U.) **The extinction of fear as a function of distance versus dissimilarity from the original conflict situation.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 530-533.—An earlier study (see 30: 4198) studied the behavior of rats running down alleys in which they had been shocked in comparison to alleys resembling, to various degrees, the original shock alley. Since the least similar alley was always furthest away from the original, alley similarity and distance were confounded. The present investigation was an attempt to correct this confounding. It was shown that the rat's capacity to overcome the inhibitory effects of shock experienced in one alley was related to distance from the original alley, not dissimilarity.—*G. Frank.*

752. Hanson, Harley M. (Merck Inst. Therapeutic Research) **Response patterns following manipulandum change.** *J. exp. Anal. Behav.*, 1962, 5(2), 237-238.—Much difficulty was encountered in attempting to train squirrel monkeys on an avoidance schedule. These difficulties were not found after the manipulandum was changed.—*J. Arbit.*

753. Holz, William C., & Azrin, Nathan H. (Anna State Hosp., Ill.) **Interactions between the discriminative and aversive properties of punishment.** *J. exp. Anal. Behav.*, 1962, 5(2), 229-234.—"Punishment acquires a discriminative property when it is selectively paired with either reinforcement or extinction. At the milder punishment intensities, the discriminative control exerted by punishment is similar to the discriminative control exerted by a response-produced neutral (nonaversive) stimulus. However, the effect of the aversive property is apparent as the intensity of the punishment is increased. The aversive property of the punishment acts to enhance the discriminative control when the punishment is selectively applied during extinction periods, and to attenuate the discriminative control when the punishment is selectively applied during reinforcement periods. One major difference was found between the control exerted by the punishment and the response-produced neutral stimulus: Responding greatly increased after the S^A punishment but not after the S^A neutral stimulus; this increase in responding was independent of the punishment intensities studied."—*Author abstract.*

754. Iwahara, S. (Nara Women's U.) **Response vs. stimulus fixation in the shocked rat.** *Psychol. Rep.*, 1962, 10(1), 41-42.—For 120 rats, trained to escape shock by running to either goal box of a T

maze, responses were repeated more often than stimuli when the T was reversed. The effect was not affected by changing intertrial interval from 5 min. to 30 sec. nor by pretraining for position preference reduction.—*B. J. House.*

755. Sidman, Murray. (Walter Reed Army Inst. Research) **An adjusting avoidance schedule.** *J. exp. Anal. Behav.*, 1962, 5(2), 271-277.—"A shock-avoidance schedule is described in which the animal accumulated 5 sec of safe time whenever it pressed a lever. With this schedule, the animal was not differentially reinforced for long pauses between responses; and, consistent with this property of the schedule, the probability that the animal would press the lever was not related in any regular way to the amount of time that had elapsed since its preceding lever press. Other features of the performance are also described. If the animal was given a warning stimulus whenever it came within 5 sec of a shock, it tended to spend more time in the close temporal vicinity of the shock and less time at the maximum temporal distance from shock."—*Author abstract.*

756. Sidman, Murray. (Walter Reed Army Inst. Research) **Classical avoidance without a warning stimulus.** *J. exp. Anal. Behav.*, 1962, 5(1), 97-104.—"White rats were scheduled to be shocked every 15 sec; but they were given a limited time interval between shocks when they could prevent the next scheduled shock from occurring if they pressed a lever. The duration of this limited avoidance period was varied, as was its location within the interval between scheduled shocks. Response rate, shock frequency, and the temporal distribution of lever presses were examined. Conditions were generated in which the formation of a temporal discrimination prevented the animals from maintaining successful avoidance behavior."—*Author abstract.*

757. Sidman, Murray. (Walter Reed Army Inst. Research) **Reduction of shock frequency as reinforcement for avoidance behavior.** *J. exp. Anal. Behav.*, 1962, 5(2), 247-257.—"An avoidance technique was used in which rats had two levers available, with independent shock schedules associated with each. Behavioral patterns in initial conditioning and in the maintenance of the responses with various response-shock intervals led to the suggestion that reduction of shock density be considered an important variable in avoidance behavior."—*Author abstract.*

758. Trabasso, Thomas R., & Thompson, Richard W. (Michigan State U.) **Supplementary report: Shock intensity and unconditioned responding in a shuttle box.** *J. exp. Psychol.*, 1962, 63(2), 215-216.—Kimble (1955) studied UCRs of rats to different intensities of shock. He found that shock elicited 2 kinds of responses, "flinching" at lower intensities and "jumping," which increased in frequency as shock intensity increased. Since the order of shock presentation may influence the frequency of responding and the dimensions of the shuttlebox have been found to limit the response repertoire of S, the present study was designed to replicate Kimble's with modification of these variables. The findings support the generality of Kimble's results.—*J. Arbit.*

Reinforcement

759. Aivazashvili, I. M. (Inst. Physiology, Tbilisi, USSR) **O vozmozhnosti vyrabotki uslovnogo pe-**

redvizheniia sobaki bez kakogo-libo podkrepleniia. [On the possibility of developing conditioned locomotion in the dog without any reinforcement.] *Soobshch. Akad. Nauk Grus. SSR*, 1962, 28(2), 227-233.—In the absence of alimentary reinforcement, forcibly leading a dog a given distance to a source of sound does not lead to positive conditioned locomotion, however often the procedure is repeated. But, if after 6-8 leadings, a single reinforcement is given, the dog can be positively conditioned. After a great number of leadings without reinforcement a negative conditioned reaction is formed, after which it becomes quite difficult to form a positive conditioned reaction to the sound-source with alimentary reinforcement.—*I. D. London.*

760. Barnes, Henry William. (U. Pittsburgh) **An investigation of the effects of some schedules of intermittent reinforcement on the precisely timed response of the rat.** *Dissert. Absr.*, 1961, 22(1), 329-330.—*Abstract.*

761. Berryman, R., & Nevin, J. A. (Hunter Coll.) **Interlocking schedules of reinforcement.** *J. exp. Anal. Behav.*, 1962, 5(2), 213-223.—"Four male pigmented rats were exposed to a procedure designed to investigate the relation between several performance measures and a schedule continuum ranging from FR 36 to FI 2 through four intermediate interlocking schedules. On all schedules, each subject developed a stable performance that was generally break-and-run. Analysis of the cumulative records, post-S^R breaks, and running rates showed a continuum of performance related to the schedule continuum."—*Author abstract.*

762. Bolles, R. C. (Hollins Coll.) **Percentage timing reinforcement schedules.** *Psychol. Rec.*, 1961, 11, 349-353.—Reinforcement was given during percentages of a fixed temporal cycle (15 sec.). "Seven rats were run in a two-bar operant situation to determine the discrimination threshold of differential pay-off probabilities between the two bars. The threshold was found to be just less than the difference between reinforcement 23% and 37% of the time cycle. Other features of percentage timing schedules, particularly the behavioral effects of using different pay-off probabilities, were investigated and are discussed."—*R. J. Seidel.*

763. Brownstein, Aaron J. (U. Missouri) **Predicting instrumental performance from the independent rates of contingent responses in a choice situation.** *J. exp. Psychol.*, 1962, 63(1), 29-31.—4 albino rats "were given bar-press tests with 8% and 32% sucrose concentrations presented singly and simultaneously. When tested singly, bar-press rate was inversely related to concentration. When tested simultaneously, a direct relationship was obtained. The direct relationship is due to the much suppressed responding on the 8% contingent bar with no change in rate of the 32% contingent bar. The fact that the bar-press rates parallel rates obtained for drinking in single and simultaneous tests supports Premack's (1959, 1961) theory."—*J. Arbit.*

764. Capaldi, E. J., & Senko, Monte G. (U. Texas) **Acquisition and transfer in partial reinforcement.** *J. exp. Psychol.*, 1962, 63(2), 155-159.—Rats were trained to traverse a runway under conditions of 33% reinforcement. Pattern of reinforcement and color of box in which reinforcement or

nonreinforcement occurred were varied. Predictions were derived from an aftereffects hypothesis. It was found that some of the results could not be accounted for by the serial patterning version of the discrimination hypothesis.—*J. Arbit.*

765. Catania, A. Charles. (Harvard U.) Independence of concurrent responding maintained by interval schedules of reinforcement. *J. exp. Anal. Behav.*, 1962, 5(2), 175-184.—"A pigeon's responses were reinforced on a variable-interval schedule on one key; and, concurrently, either a multiple or a fixed-interval schedule of reinforcement was in effect on a second key. These concurrent schedules . . . were programmed with or without a changeover delay (COD). Because the COD provided that responses on one key could not be followed by reinforced responses on the other key, responding on one key was not likely to accidentally come under the control of the reinforcement schedule of the other. When the COD was used, the performances on each key were comparable to the performances maintained when these interval schedules are programmed separately. . . . The concurrent performances, however, did include certain interactions involving the local characteristics of responding and the over-all rates of responding maintained by the various schedules. The relevance of the present findings to an inter-response time analysis of VI responding, a chaining account of FI responding, and the concept of the reflex reserve was discussed."—*Author abstract.*

766. Clark, Fogle C. (Evansville State Hosp., Ind.) Some observations on the adventitious reinforcement of drinking under food reinforcement. *J. exp. Anal. Behav.*, 1962, 5(1), 61-63.—"The development of strong postreinforcement drinking behavior under variable-interval food reinforcement in rats was found to be influenced by the proportion of short intervals in the VI and the proximity of the water tube to the lever."—*Author abstract.*

767. Collier, George; Knarr, Frederick A., & Marx, Melvin H. (U. Missouri) Some relations between the intensive properties of the consummatory response and reinforcement. *J. exp. Psychol.*, 1961, 62(5), 484-495.—2 groups of rats were run in a 16-ft. runway to a drinking tube. One group received 4% sucrose and the other, 32%. Both groups were allowed a fixed time on the drinking tube. The number of licks, amount consumed, and the times to traverse successive segments of the runway were measured. Variation in consummatory activity was not associated with variation in running. Introducing a delay did not result in variations in consummatory activity commensurate with those produced in running. Shift in reinforcement magnitude (up or down) disrupted consummatory behavior. Additional findings relating these variables are discussed.—*J. Arbit.*

768. Dyal, James A. (Southern Methodist U.) Latent extinction as a function of number and duration of pre-extinction exposures. *J. exp. Psychol.*, 1962, 63(1), 98-104.—96 rats were trained in a Y maze and then given differential treatment with regard to number and duration of unrewarded goal box placements. Control 9s were placed in a neutral box. A strong latent extinction effect was obtained for speed of entering the goalbox and number of errors. This effect was influenced by number and

duration of placements and by total exposure time, sometimes independently and sometimes in interaction. 2 theories of latent extinction were examined—frustration and r_g diminution. Both could accommodate the effects of number and duration of placements, with the exception that r_g theory had difficulty explaining the transitory nature of the effects.—*J. Arbit.*

769. Gonzaliz, R. C., & Bitterman, M. E. (Bryn Mawr Coll.) A further study of partial reinforcement in the turtle. *Quart. J. exp. Psychol.*, 1962, 14(2), 109-112.—2 matched groups of mature painted turtles, *Chrysemys picta picta*, were trained in a simple runway, one with partial and the other with consistent reinforcement, following which both groups were extinguished. The partially reinforced animals ran more slowly in acquisition, but showed somewhat greater resistance to extinction. The results are compared with those obtained in analogous experiments with other animals.—*Journal abstract.*

770. Hodos, William. (Walter Reed Army Inst. Research, Washington, D. C.) Progressive ratio as a measure of reward strength. *Science*, 1961, 134(3483), 943-944.—4 rats were trained to press a lever on a ratio schedule of reinforcement in which the number of lever presses required on each consecutive run increased by a fixed increment. Both concentration and volume of the reward were varied. Relationships were obtained between reward and deprivation variables and the size of the final completed ratio run.—*Journal abstract.*

771. Hulse, Stewart H., & Bacon, W. Edward. (Johns Hopkins U.) Supplementary report: Partial reinforcement and amount of reinforcement as determinants of instrumental licking rates. *J. exp. Psychol.*, 1962, 63(2), 214-215.—A previous study used large and small wet-mash rewards and examined resistance to extinction of a running response after 50% and 100% reinforcement. After partial reinforcement, the larger reward produced much faster running than the small reward; but after continuous reinforcement, the large reward produced slower running than the small reward. The present study generalizes this observation to instrumentally-conditioned licking.—*J. Arbit.*

772. Hurwitz, H. M. B. (Birkbeck Coll., U. London, England) Periodicity of response in operant extinction following continuous and fixed ratio reinforcement. *Quart. J. exp. Psychol.*, 1962, 14(1), 1-7.—The rate of response during an extinction session of 2 groups of rats, trained under a continuous and a fixed ratio reinforcement schedule, respectively, was examined. It was found that both sets of data required a 2-factor analysis, Factor r_A describing the rate of response during response burst periods and Factor t_0 the rate of quiescent, non-response periods. Both reinforcement and extinction sessions were analysed with respect to response pattern distributions. It was found that on this variable the 2 groups differed significantly from each other.—*Journal abstract.*

773. Ison, James Ratcliffe. (U. Michigan) Changes in instrumental response speed following rewarded endbox placement. *Dissert. Abstr.*, 1961, 21(12), 3861.—*Abstract.*

774.* Jensen, Glen D. (U. New Mexico) Partial reinforcement effects (PREs) and inverse

PREs determined by position of a nonrewarded block of responses. *J. exp. Psychol.*, 1961, 62(5), 461-467.—9 groups of 10 rats each were run through conditions of successive blocks of rewarded (R) and nonrewarded (NR) bar presses in a Skinner box. Animals that had a series of R trials following a block of NR trials pressed faster during a NR test series than a control group. When the R trials preceded the NR trials, slower rates of pressing were found on the test series.—*J. Arbit.*

775. Kelleher, Roger T., & Fry, William T. (Smith, Kline & French Lab.) Stimulus functions in chained fixed-interval schedules. *J. exp. Anal. Behav.*, 1962, 5(2), 167-173.—"Pigeons were required to complete three successive fixed-interval components to obtain food. When the same exteroceptive stimulus was correlated with the three components, responding was positively accelerated between food deliveries. When different exteroceptive stimuli were correlated with each component in a fixed sequence, prolonged pauses developed in the first component; low response rates developed in the second component; and responding was positively accelerated in the second and third components. When different exteroceptive stimuli were correlated with each component in a variable sequence, responding was positively accelerated in each component. Because the response and reinforcement contingencies were the same in all three procedures, the differences in performances must be due to the changes in the sequence of stimuli."—*Author abstract.*

776. Kelleher, Roger T., Riddle, William C., & Cook, Leonard. (Smith, Kline & French Lab.) Observing responses in pigeons. *J. exp. Anal. Behav.*, 1962, 5(1), 3-13.—"Pigeons were trained on an observing-response procedure in which periods of VR 100 and EXT alternated unpredictably during a white light (mixed stimulus). During VR 100, responses on a food-producing key were intermittently reinforced. Responses on the observing key produced a green light (positive stimulus) when VR 100 was in effect, and a red light (negative stimulus) for EXT. The birds did not respond on either key during the negative stimulus, but they responded on the food-producing key when the positive stimulus appeared. When observing responses produced the positive or negative stimulus on FR, observing responses were maintained until the FR reached a maximum. . . . When observing responses did not produce either stimulus, the observing-response rates fell to zero." The effect of chlorpromazine on observing-response rates is noted.—*J. Arbit.*

777. Kish, George B., & Barnes, Gerald W. (VA Hosp., Richmond, Va.) Reinforcing effects of manipulation in mice. *J. comp. physiol. Psychol.*, 1961, 54, 713-715.—Nondeprived mice were tested in a box containing a lever, which was rigid for one group and movable for the other. The movable bar produced longer durations of separate contacts, without changing the number of contacts. The results are felt to support the hypothesis that any environmental change may be reinforcing.—*W. A. Wilson, Jr.*

779. McCain, Garvin Marvin. (U. Texas) Acquisition and reversal of a discrimination habit as a function of pre- and post-schedule of reinforcement and length of training series. *Dissert. Abstr.*, 1961, 21(12), 3862.—*Abstract.*

780. Notterman, J. M., & Mintz, D. E. (Princeton U.) Exteroceptive cueing of response force. *Science*, 1962, 135(3508), 1070-1071.—Food pellet reinforcement for rats was made contingent upon the peak force of a bar-pressing response falling within restricted limits. 2 such "bands," 5 to 10 grams and 15 to 20 grams, were established the momentarily correct "band" indicated by one of two exteroceptive stimulus values. Peak force of response tended to conform to the reinforcement requirements, the 2 stimulus values setting the occasion for differentiated distributions of response force.—*Journal abstract.*

781. Premack, David, & Collier, George. (U. Missouri) Analysis of nonreinforcement variables affecting response probability. *Psychol. Monogr.*, 1962, 76(5, Whole No. 524), 20 p.—A report of a series of 9 experiments to establish the effect of a variety of time and time-related variables on the nonconsummatory responses of female, albino rats. Bar-press and light-contingent bar-press served as responses throughout these studies while the variables included: intersession interval, physical composition of between-session maintenance environment, and the duration of the maintenance in the pretest environment. All the variables appeared to "have systematic effects upon response freedom without explicitly manipulating consequences of the measured response." A discussion of the decrement-recovery models to account for observed differences in behavior is included.—*M. A. Seidenfeld.*

782. Rozin, Paul N., & Mayer, Jean. (Harvard U.) Thermal reinforcement and thermoregulatory behavior in the goldfish, *Carassius auratus*. *Science*, 1961, 134(3483), 942-943.—Goldfish in a warm environment can cause a small drop in the temperature of their environment by pressing a lever. The fish regulate the temperature of their environment, keeping the temperature between 33.5° and 36.5° C. most of the time.—*Journal abstract.*

783. Sato, Toshiaki. Characteristics of the instrumental response recovered from extinction by free reinforcement. *Tohoku psychol. Folia*, 1961-62, 20(3-4), 89-95.—Extinguished lever-pressing was recovered in 3 groups of rats. The characteristics of the recovered response were found to be goal-directed; the underlying incentive mechanism was discussed in terms of Spence's hypothesis—*G. Rubin-Rabson.*

784. Segal, Evalyn F. (Walter Reed Army Inst. Research) Exteroceptive control of fixed-interval responding. *J. exp. Anal. Behav.*, 1962, 5(1), 49-57.—"Two pigeons were exposed to several fixed-interval schedules of food reinforcement. In some cases, exteroceptive stimuli associated with the passage of time were present. Such visual 'clock' stimuli were found to gain almost complete control over the behavior, although at the longest fixed intervals studied, the superposition of a new temporal discrimination upon the visual discrimination was observed. Where clock stimuli were made contingent upon the birds' behavior, a new form of responding

was generated. This behavior was discussed in terms of positive and negative response-tendencies resulting from several stimulus factors."—*Author abstract.*

785. **Sperling, Sally E.** (U. Michigan) **Extinction effects following nondifferential reinforcement of an irrelevant stimulus.** *J. exp. Psychol.*, 1962, 63(1), 50-56.—Rats were given 40 or 80 acquisition trials in an elevated runway under single stimulus presentation, using wide and narrow striped stimulus platforms and a light bulb, mounted on a swinging door, that was either on or off. All Ss were given 16 extinction trials on the wide platform with the light bulb and swinging door removed. In general the data are consistent with the interpretation that the primary determinant of extinction is the past reinforcement history associated with the stimuli presented during extinction, regardless of their previously relevant or irrelevant status. Thus, nondifferential reinforcement of an irrelevant stimulus may be considered to be equivalent to 50% partial reinforcement.—*J. Arbit.*

786. **Wist, Eugene R.** (U. Missouri) **Amount, delay, and position of delay of reinforcement as parameters of runway performance.** *J. exp. Psychol.*, 1962, 63(2), 160-166.—2 reinforcement concentrations (8% and 32% sucrose solutions), 2 delay intervals (3 and 45 sec.), and 3 delay positions (2, 6, and 10 ft. from the goal box) were factorially combined in a study of rat performance and consummatory behavior in a runway. Running occurs "at rates determined by its consequences such as the concentration of reinforcement, and it occurs everywhere at the same rate independent of its temporal or spatial distance from its climax. Factors such as fatigue or habituation may result in declines in rate over long distances. Factors such as obstacles and distracting stimuli may produce local disturbances in running, but do not manipulate its basic rate. Time and distance factors, important in the classical treatment of performance gradients do not readily account for the effects obtained."—*J. Arbit.*

787. **Witte, Robert S.** (San Jose State Coll.) **Conditional response probability in a T maze.** *J. exp. Psychol.*, 1961, 62(5), 439-447.—"A model derived from statistical learning theory was tested with rats in a T maze. The major independent variables were two sequentially dependent reward schedules and four intertrial intervals. After preliminary training under massed trials, the Ss [naive hooded rats] under a given reward schedule were rotated through each intertrial interval in accordance with a latin square design. . . . In general, the theory successfully predicted changes in conditional response probability as a function of both trial spacing and various sequences of rewards."—*J. Arbit.*

788. **Wunderlich, Richard A.** (Johns Hopkins U.) **Strength of a generalized conditioned reinforcer as a function of variability of reward.** *J. exp. Psychol.*, 1961, 62(4), 409-415.—Rats were run in a straight alley under different types of reward (food, water, or both) and distribution of these rewards. Evidence for a generalized conditioned reinforcer (GCR) was found, i.e., a group that received either food or water randomly from trial to trial demonstrated greater resistance to extinction than groups receiving both food and water, only food, or only water from trial to trial. The reinforcement strength in the GCR effect was noted.—*J. Arbit.*

Motivation & Learning

789. **Cicala, George A.** (Princeton U.) **Running speed in rats as a function of drive level and presence or absence of competing response trials.** *J. exp. Psychol.*, 1961, 62(4), 329-334.—2 experiments, using Cotton's technique of analyzing noncompeting response trials separately, were performed to determine the role of extraneous stimuli in the acquisition and performance of an instrumental running response. The results supported the view that asymptotic performance varies as a function of drive and that this relation obtains even when competing response trials are removed from the data.—*J. Arbit.*

790. **Clayton, Keith Neil.** (Northwestern U.) **The relative effects of forced reward and forced nonreward during successive discrimination reversal.** *Dissert. Abstr.*, 1961, 21(10), 3162.—*Abstract.*

791. **Fujita, Osamu.** (Tokyo U. Education) [Studies of spontaneous alternation in the rat: VIII. The effect of food deprivation, reward, and intertrial interval.] *Jap. J. Psychol.*, 1961, 32(5), 303-310.—Previous studies in this series had shown that spontaneous alternation decreased with an increase of food deprivation when the reward was available at both ends of a T maze. In the present study the variable of reward-nonreward was added to those of the original experiment, which was then replicated. Compared with the nonreward condition, reward served to decrease significantly the percentage of alternation under conditions of 48 hr. of food deprivation. In addition, an increase in time of deprivation significantly decreased the animals' running time under both rewarded and nonrewarded conditions. The author suggests that the results point to an interaction of food deprivation with reward. (English summary)—*J. Lyons.*

792. **Shaw, Thomas Howard.** (New York U.) **Frustration and anxiety: A study of differences between frustration and anxiety drive properties in selective learning.** *Dissert. Abstr.*, 1961, 21(12), 3865-3866.—*Abstract.*

793. **Solomon, R. L., & Turner, L. H.** (U. Pennsylvania) **A note on "A goalless gradient."** *Psychol. Rep.*, 1962, 10(1), 203-208.—Performance of 31 well-tamed, hungry, and thirsty rats on the first run in a 24-ft. maze showed evidence for a goal gradient in retracing measures but not in running speed. The relevance of the results to the hypothesis that the goal gradient results from the interaction between fear and curiosity was discussed.—*B. J. House.*

795. **Storms, Lowell H., Borocz, George, & Broen, William E., Jr.** **Punishment inhibits an instrumental response in hooded rats.** *Science*, 1962, 135(3509), 1133-1134.—Punishment led to the cessation of a food-rewarded bar-pressing response in hooded rats deprived of food for 23 hours. The response remained inhibited for 2 weeks, and only 1 of 4 rats resumed responding when food deprivation was increased to 47 and 71 hours.—*Journal abstract.*

796. Thompson, Merrell E., & Martin, Edward J. (New Mexico State U.) **Supplementary report: Alternation in a T maze with habit held constant.** *J. exp. Psychol.*, 1961, 62(6), 629.—The present study was designed to give a simple and more concise test of the author's 2-factor theory of inhibition and to check upon earlier conclusions regarding the role of reinforcement and stimulus variables and their interaction. As in the previous report, it was found that nonrewarded rats will alternate stimuli and repeat responses in a Cross T maze when the maze arms are dissimilar and will alternate response and repeat stimuli in a Cross T maze when the arms are similar. No support was found for the hypothesis that rewarded rats will alternate responses and repeat stimuli in the Cross T maze.—*J. Arbit.*

797. Woods, Paul J. (Hollins Coll.) **Behavior in a novel situation as influenced by the immediately preceding environment.** *J. exp. Anal. Behav.*, 1962, 5(2), 185-190.—"Behavior in a novel situation, which basically represented an increase in complexity for some Ss and a decrease in complexity for others, was sampled by the use of an exhaustive list of response categories at 5-sec. intervals for 24 min. Wide behavioral differences are described. In addition, the feasibility of the time-sampling technique for the study of animal behavior is further demonstrated, and its more general use is advocated.—*Author abstract.*

COMPLEX PROCESSES

798. Firsov, L. A. (Acad. Science SSSR) **Sravnitel'naya kharakteristika povedeniya i nekotorykh vegetativnykh funktsii u shimpanze.** [Comparative characteristics of the behavior and several vegetative functions of chimpanzees.] *Dokl. Akad. Nauk SSSR*, 1961, 141(6), 1522-1524.—On the basis of behavioral reactions 5 chimps were classified as representatives of phlegmatic or excitable types of nervous systems. The indices for type of nervous system consisted of such manifestations as general aggressive behavior, motor activity during the night, conditionability, etc. It was then found that animals so classified differed on indices of a number of vegetative functions. In general these functions were more stable in the phlegmatic animal than in the excitable. For example, body temperature and length of sexual cycle were more constant in the phlegmatic animal.—*H. Pick.*

799. Frings, Hubert. (U. Hawaii) **Animal communication.** *Amer. J. Psychiat.*, 1962, 118(10), 872-880.—Communication, defined as transmission of information from one organism to another via chemical or physical means, is discussed as it operates in a wide variety of animal species.—*N. H. Pronko.*

800. Hearst, Eliot. (St. Elizabeths Hosp., Washington, D. C.) **Delayed alternation in the pigeon.** *J. exp. Anal. Behav.*, 1962, 5(2), 225-228.—"Pigeons were studied in a delayed-response task requiring alternation of key pecks on two response keys. Blackouts of from 1 to 10 sec intervened between successive choices on the two keys. The following results were obtained. (1) Birds performed at well above chance accuracy on all the delays tested. Accuracy was generally lowest at 1- and 10-sec delays. (2) Overt postural orientations during the delay interval appeared to mediate accurate key-

pecking behavior. (3) The shape of the delay vs. accuracy function was discussed in terms of the possibly confounding influences of (a) stimulus 'trace' variables, and (b) aversive effects of the time outs produced by incorrect responding.—*Author abstract.*

801. Richard, Paul-Bernard. **Essai préliminaire sur l'adaptation a des problèmes simples chez le castor (castor fiber).** [Problem solving in beavers.] *J. Psychol. norm. pathol.*, 1960, 57(4), 421-430.—2 beavers living in a natural environment—in a park containing a pond and with free access to food at all times—were presented some detour tasks and problem boxes containing additional food. Observations concerning sensory cues, memory for position, and manipulation of the several opening mechanisms of the boxes revealed greater learning capacity than had been described heretofore in rodents.—*M. L. Simmel.*

802. Smythe, R. H. **How animals talk.** Springfield, Ill.: Charles C Thomas, 1961. 109 p. \$4.50.—"This book discusses the methods by which, and the extent to which, animals communicate with one another. Such communication may be effected by the production of sound waves or by the exhibition of some particular form of behaviour. . . . we will . . . consider the possibility of animal communication without the use of recognisable language or an alphabet, and try to determine whether the means that animals employ and the results they attain are in any way comparable with those we ourselves achieve."—*C. J. Adkins.*

803. Smythe, R. H. **The mind of the dog.** Springfield, Ill.: Charles C Thomas, 1961. 119 p. \$4.50.—A variety of psychological factors are discussed in this popular approach. The material is organized into 6 chapters as follows: "Concerning Psychology," "Dog and Man," "Factors Influencing Behavior" (imprinting, intelligence, temperament, memory, orientation, sense of humor, and conscience), "The Special Senses," "Social Behavior," and "The Female of the Species."—*C. J. Adkins.*

804. Swearingen, John J., & Mohler, Stanley R. **Sonotropic effects of commercial air transport sound on birds.** *Fed. Aviat. Agency Rep.*, 1962, No. 62-4. 5 p.—The Electra sound spectrum contains an audible chirp which appears identical in frequency and wave form to the chirp of field crickets. Field observations strongly indicate that the sound of the taxiing Electra exerts an attraction for starlings, and possibly other birds, particularly in the fall in the Northeast, when insects suddenly become less plentiful. The implications of this attraction ("positive sonotropism") for air safety are discussed. Recommended approaches to alleviating this type of bird hazard are presented.—*FAA.*

SOCIAL BEHAVIOR

805. Angermeier, W. F. (Austin Coll.) **The effect of a novel and novel-noxious stimulus upon social operant behavior in the rat.** *J. genet. Psychol.*, 1962, 100, 151-154.—6 adult albino rats were trained to press a bar for visual contact reinforcement with another male rat, a baby chick, the combined effects of a baby chick and a 100-watt light, and a chick again. The results showed that a certain type of social stimulus will raise bar-pressing frequency significantly, and that a combined novel-noxious

stimulus will depress bar-pressing significantly, but not totally eliminate it. The investigation suggested placing future emphasis on qualitative aspects of stimuli, such as hue, size, sound, and movement.—*Author abstract.*

806. Chauvin, Rémy. *Le comportement social chez les animaux.* [Social behavior in animals.] Paris, France: Presses Universitaires France, 1961. 169 p. NF 8.—3 classes of relationships among animals are distinguished: solitary life and assemblages, social relationships between individuals (aggression, play, courtship), and typical animal societies (characterized by common tasks and division of labor). Principal attention is given to insects—especially bees, ants, wasps, and termites. Birds, fish, and mammals are less extensively treated.—C. J. Smith.

807. Freedman, Lawrence Zelic, & Rosvold, H. Enger. (U. Chicago Medical School) Sexual, aggressive and anxious behavior in the laboratory macaque. *J. nerv. ment. Dis.*, 1962, 134(1), 18-27.—The hypothesis was tested that measurable changes in interanimal relationship in sexuality would result as a function of systematically varying the endocrine level of the female. 7 mature rhesus macaques (4 ovariectomized females and 3 intact males) successively paired with each other were observed for a period of 2 years under standard laboratory conditions. Estrogen changes in the female were significantly related to variations in the sexual, aggressive, and anxiety interaction of males as well as females.—N. H. Pronko.

808. Mason, William A. (Yerkes Lab. Primate Biology) The effects of social restriction on the behavior of rhesus monkeys: III. Dominance tests. *J. comp. physiol. Psychol.*, 1961, 54, 694-699.—Dominance relationships were studied within a group of 6 laboratory-reared (restricted) monkeys and within a group of 6 feral monkeys. Stable relationships established in the feral animals in non-competitive situations were maintained with little change over 16 sessions of food-competition testing. Dominance relationships of restricted monkeys were unstable in the competition situation, and bore little relationship to other measures of social behavior, demonstrating "the importance of social learning in the establishment and maintenance of dominance relationships."—W. A. Wilson, Jr.

• ABNORMAL BEHAVIOR

809. Farren, Donald R. (Florida State U.) The effect of length of food and water deprivation and schedule of noxious stimulation upon production of ulcers in the rat. *Dissert. Abstr.*, 1961, 21(12), 3850-3851.—*Abstract.*

Dilute locus and audiogenic seizures in mice. *Science*, 1962, 136(3513), 318-319.—Evidence which indicates a positive relationship between susceptibility to audiogenic seizure and dilute coat color in mice is presented, and a possible mechanism for this relationship is discussed.—*Journal abstract.*

811. Krushinskii, L. V. (Moscow State U.) Animal behavior: Its normal and abnormal development. New York: Consultant's Bureau, 1962. xviii, 260 p. \$12.50.—(Translated from the original Russian.) The author's thesis is that complex ani-

mal behavior is the result of an integration of innate and acquired reflexes. Investigations and literature are described which show how this type of mechanism operates in the case of defense reactions of dogs. The development of behavior in relation to the classical Pavlovian types of nervous system is described. This relationship is further developed by showing how endocrine factors affect behavior by influencing the functional state of the nervous system. Further studies described include manipulation of the nervous system itself through use of drugs and genetic control. Finally a recently investigated type of complex behavior, the "extrapolation reflex" is described. This consists of a type of tracking response in animals. H. Pick.

DEVELOPMENTAL PSYCHOLOGY

812. Bergeron, Marcel. Les conceptions psycho-biologiques de Henri Wallon. [The psychological concepts of Henri Wallon.] *Evolut. psychiat.*, 1962, 27(1), 27-65.—Wallon's comparative studies of motor and mental stages in normal and defective children formed the basis for his psychobiosociological concept of developmental stages, as follows: First, the child goes through a series of progressive stages (emotional, sensory-motor, and projective, with the help of postural and motor functions, and sensorial activity). Next, is the stage of emotions, involving different processes of perception and representation, symbolic or verbal. Personality is formed around the body image and roles assumed in primary interpersonal relationships. The article concludes in a criticism and comparison with psychoanalytic concepts. (39-item bibliogr., English summary)—L. A. Ostlund.

813. Comalli, P. E., Jr., Wapner, S., & Werner, H. (Clark U.) Interference effects of Stroop color-word test in childhood, adulthood, and aging. *J. genet. Psychol.*, 1962, 100, 47-53.—The study was directed towards uncovering differences during ontogenesis and aging concerning the capacity of an individual to maintain a uniform course of action independent of interfering stimuli. A modified form of the Stroop color-word test was used. This test consisted of 3 tasks: (a) reading of 100 color words (red, blue, and green) printed in black ink, (b) naming 100 rectangular patches of color (red, blue, and green), (c) naming the color of the ink in which 100 color-words (red, blue, and green) were printed, but where the actual color of the ink was different from the color designated by the word. The critical part of the test (c) involved interference of word reading with color naming. The Stroop test was administered to a total of 235 Ss ranging from 7 to 80 years of age. It was found that the degree of interference of color-words on color naming is greatest with young children, decreases with increasing age to adulthood, and increases again with older ages. These changes with age were interpreted in terms of comparative-developmental theory.—*Author abstract.*

814. Dublineau, Jean. L'emotion dans l'oeuvre de Wallon et le problème typo-évolutif. [Emotion in the work of Wallon and the problem of evolutionary types.] *Evolut. psychiat.*, 1962, 27(1), 67-89.—A synthesis of the contributions of Wallon and the author points up the distinction that while Wallon describes development in somewhat separate stages,

Dublineau suggests that instead of a progression, these stages may be concomitant. However, a developmental crisis reproduces the progress of emotional and motor alterations, with a certain degree of organic and psychic maturation of motor and emotional functions. Thus, Wallon's work lends support to Dublineau's theory of a functional and evolutionary typology. (English summary)—*L. A. Ostlund.*

815. Engel, George L. (U. Rochester) **Psychological development in health and disease.** Philadelphia, Pa.: W. B. Saunders, 1962. xxxiv, 435 p.—A text for medical students and psychiatric residents. Part I conceptualizes behavior from a psychoanalytic viewpoint, "a biologically determined developmental destiny, adapted to and adjusting in a physical, interpersonal, and social environment." Part II examines ways in which development, adaptation, and adjustment may be disturbed or interfered with by environmental stress such as grief, danger, disaster, and deprivation. The significance of unresolved intrapsychic conflicts are considered. Biological, psychological, and social factors predisposing to psychiatric disease; the phenomenology of psychiatric disease; factors underlying syndrome formation; nosological categories; and somatic consequences of psychological stress in compensated states (conversion reaction, pain) and decompensated states (somatopsychic-psychosomatic disorders) are described.—*C. H. Miley.*

816. Engelmann, Wolfhard. **Reifungsentwicklung und Reifungsveränderung im gefühlsbetonten Wertungsbereich unserer Jugend.** [Development of maturation and maturation changes in the realm of emotionally tinted values of our youth.] *Psychol. Rdsch.*, 1962, 13(2), 131-140.—4457 pupils, age 9-17, wrote essays on "who I would like to be most (least) and why." The statistical evaluation of the results compared to similar, previous studies dating back to 1901 show acceleration of today's youth in the realm of practical intelligence but retardation in the ethical realm. The gap between practical intelligence and critical control leads to increased tensions in today's youth. This might explain the frequently observed proneness to succumb to conflicts.—*W. J. Koppietz.*

817. Hadfield, J. A. **Childhood and adolescence.** Baltimore, Md.: Penguin, 1962. 286 p. \$1.25.—The material of the book was derived from 4 sources: the Leytonstone Homes of about 300 children, where the author was consultant psychologist; the analysis of patients suffering from behavioral and psychoneurotic disorders; the diaries which the author kept of his 3 sons in the early part of their lives, as well as his observations of his grandchildren; and, finally, the publications of others—Gesell, Murchison, and Carmichael. The author writes from his own observations first and then supports or interprets his observations through the writings of others. Drawing on a long clinical experience he describes in simple terms a child's natural equipment, the theory of maturation, the phases of early development, the organization of personality, and the period of adolescence. 2 final chapters, on abnormalities and the principles of parenthood, close the book. This is an equally valuable introduction to childhood and adolescence for parents and teachers.—*P. D. Leedy.*

818. Lewis, M. M. (U. Nottingham, England) **How children learn to speak.** New York: Basic Books, 1959. 144 p. \$3.00.—First published in

London (George G. Harap) in 1957, this is a popular account of language development during the first 2 years of life. It consists of 11 chapters in 4 parts. The 1st is concerned with why the baby cries, including a description of his 1st cries and noises and of his responses to sound. Part II consists of 2 chapters dealing with babbling and imitation. In Part III there are 4 chapters concerned with the child's understanding of words, his use of 1st words, the acquisition of the mother tongue, and the naming stage. The 4th part takes up problems of changes in word form and meaning. The book is based largely on the biographical study of the author's own son published originally under the title *Infant Speech* in 1936 (see 11: 515).—*D. McCarthy.*

819. Witkin, H. A., Dyk, R. B., Fattuson, H. F., Goodenough, D. R., & Karp, S. A. (State U. New York Coll. Medicine) **Psychological differentiation: Studies of development.** New York: Wiley, 1962. xii, 418 p. \$7.95.—Psychological differentiation and integration are essential attributes for adequate adjustment. The foregoing statement serves as the basis for a large number of investigations which fall into 3 major areas: self-consistency in individual functioning as an expression of extent of differentiation; the contribution of life experiences and characteristics present in early infancy to pace development of differentiation; and stability of individual patterns of functioning during development. Extensive descriptions of method and results are presented as well as exemplary case studies.—*W. J. Meyer.*

INFANCY

820. Blauvelt, Helen H. (State U. New York) **Capacity of a human neonate reflex to signal future response by present action.** *Child Developm.*, 1962, 33(1), 21-28.—"The orienting or 'rooting' reflex, which often initiates feeding, was stimulated three times (three trials) repetitively in neonates in the first four days of life. A dependency of a response at the third trial upon a response at the second trial was shown. This is suggested as a signal enabling the mother to anticipate the infant's response in the task of initiating the first feedings."—*N. J. Meyer.*

821. Freedman, Daniel G. (Langley Porter Neuropsychiatric Inst.) **The infant's fear of strangers and the flight response.** *J. Child Psychol. Psychiat.*, 1961, 2(4), 242-248.—This fear makes its appearance at about 5-10 months. It was hypothesized, but not tested, that it is homologous to the flight response found in other mammals.—*J. M. Reisman.*

822. Ingram, T. T. S. (U. Edinburgh) **Clinical significance of the infantile feeding reflexes.** *Developm. Med. Child Neurol.*, 1962, 4(2), 159-169.—The diagnostic significance of the rooting, lip, suck, and swallowing reflexes is limited. "Spontaneous feeding behavior gives much more valuable information, not only about the presence or absence of the feeding reflexes but also of their integration—and the extent to which they are co-ordinated with other activities of the child." (44-item bibliogr.)—*T. E. Newland.*

823. Knobloch, Hilda, & Pasamanich, Benjamin. (Ohio state U.) **The developmental behavioral ap-**

proach to the neurologic examination in infancy. *Child Developm.*, 1962, 33(1), 181-198.—In the evaluations from normal neuropsychologic functioning in infancy it must be remembered that damage to the brain usually leads to a variety of disabilities; that damage can range from minimal to severe; and that the diagnosis which is made on the basis of observed abnormal behavior is dependent on the age and maturity of the infant. "Data are presented which indicate that the behavioral approach, using the Gesell Developmental and Neurologic Examination, is a valid and reliable procedure capable of eliciting distinctive patterns in those areas of behavior in which abnormalities occur."—*W. J. Meyer.*

824. Levin, Gid'on. Keshet umaga shel hatinok im hazulat. [The baby's contact and connection with others.] *Ofakim*, 1961, 15, 82-85.—Various means of the baby's connection with people are reviewed which enable mutual relations before he begins to speak. These relations are involved in his drive energy, they are possible due to motor and perception mechanism, and they are carried out in various kinds of mutual contact.—*H. Ormian.*

825. Mitchell, Ross G. (Queen's Coll., Dundee, Scotland) The Landau reaction (reflex). *Developm. Med. Child Neurol.*, 1962, 4(1), 65-70.—The 3 components, when the infant is ventrally supported by a hand, are: (a) extension of the neck and head, (b) extension of the spine and trunk (concavity), and (c) elevative extension of the legs at the hips. The reaction may be elicited from about 3 months onwards, seldom after 12 months. The diagnostic implications and the mechanism involved are suggested.—*T. E. Newland.*

826. Parmelee, Arthur H., Jr. (U. California, Los Angeles) European neurological studies of the newborn. *Child Developm.*, 1962, 33(1), 169-180.—"I have attempted to present first the contributions of two of the major pioneers in the field of newborn neurology, Albrecht Peipes and Andres-Thomas. These men were intent on delineating the level of functioning of the nervous system of the newborn by careful observation and clinical study and by the correlation of these observations with animal experiments and neurological pathology in older children and adults. These two pioneers have been followed by two younger investigators, Heinz Prechtel and Saint Ann-Dargassus, who are more concerned with diagnostic techniques in the neurology of the newborn."—*W. J. Meyer.*

CHILDHOOD

827. Bastenford, William Leon. (Claremont Graduate School) Activation level, as measured by palmar conductance, and intelligence in children. *Dissert. Abstr.*, 1961, 21(10), 3156.—*Abstract.*

828. Bijou, Sidney W., & Baer, Donald M. (U. Washington) Child development. Vol. 1. A systematic and empirical theory. New York: Appleton-Century-Crofts, 1961. vii, 90 p. \$1.50.—Written from the viewpoints of learning theory and natural science for the college student who has little background in psychology. Following a discussion of the nature of contemporary psychology and its relationships to animal biology and cultural anthropology, the developing child is conceptualized as an inter-related cluster of responses and stimuli. The major

portion of the book is concerned with a nontechnical discussion of respondent and operant behavior and operant-respondent relations, including emotional behavior and self-control.—*C. M. Franks.*

829. Bjerg, Kresten. (Harvard U.) Oplevelse af børns adfærd. [The phenomenological study of 'perceived child behavior.' *Nord. Psykol.*, 1962, 14(1), 21-34.—"Some preliminary reflections on the subject of adults' experience of young children's behavior. An attempt is made to stress the 'search for meaning,' which the actual form of such phenomena seems to serve, and to define some of the more crucial aspects of experienced sense, i.e. interpretations of observable behavior variables (movements, cries, mimicry etc.) with special reference to the behavior of infants. The author demonstrates seven varieties or aspects of perceived meaning in child behavior . . . intensions or the obvious 'sense,' emotions, thoughts, character traits, 'cuteness,' somatic or physical aspects perceived as explanatory of behavior, and the aspect of meaninglessness or 'non-sense.' The first six of these are shown often to be ['adultmorphic']. . . More generally, however, the study is intended to delineate a hitherto relatively unexplored field of psychology, knowledge of which is shown to be fundamental to any deeper studies in child psychology." (English summary)—*L. Goldberger.*

830. Brown, Janet L. (Yale U.) Differential hand usage in three-year-old children. *J. genet. Psychol.*, 1962, 100, 167-175.—It was found that dominance (defined as a statistically significant difference in hand use) in 3-year-old nursery school children could be equally well determined from ratings of hand use on skilled or on ego-syntonic activities (activities that involved contact with objects or with people). On the other hand, dominance in non-egosyntonic actions (aggression and contact of own body) was rare, and $\frac{1}{2}$ the children actually used their nondominant hand more for these activities. It was suggested that hand use might provide a tool for the genetic study of ego-syntonic and non-ego-syntonic activities.—*Author abstract.*

831. Cohn, Fay S. (U. Michigan) Fantasy aggression in children as studied by the doll play technique. *Child Developm.*, 1962, 33(1), 235-250.—This review of the literature covers some 2 decades of experimentation and focuses on the theoretical and empirical implications that can be derived by studying fantasy aggression through doll play. Although much of the published research has been concerned with the methodological variables of doll play, it is concluded that the technique holds considerable promise for the study of the effects of such variables as frustration, punishment for aggression, and identification on doll play aggression.—*W. J. Meyer.*

832. Crow, Lester D., & Crow, Alice. Child development and adjustment: A study of child psychology. New York: Macmillan, 1962. 514 p. \$6.50.—An introductory treatment viewing the child "as an integrated growing individual who is both dynamic and purposeful. Hence each aspect of development is related to every other so that a picture of the whole child emerges. . . . The developmental approach is centered around what can be expected of the normal child, but individual deviations among children also receive attention." Questions, discussion topics, and selected references are given after each of the 20 chapters.—*B. Lowenfeld.*

833. de Lissovoy, Vladimir. (Pennsylvania State U.) Head banging in early childhood. *Child Develpm.*, 1962, 33(1), 43-56.—A group of 33 children, 23 boys and 10 girls, who were known head bangers were observed under normal bedtime conditions. The mean age of the group was 26.6 months. 4 characteristic positions of head banging were noted: on hands and knees, sitting, prone, and standing or kneeling. Age of onset ranged from 3 to 12 months and all Ss had a history of other rhythmic activities. A follow up study showed that 14 of the children had ceased head banging between 27 and 48 months of age.—W. J. Meyer.

934. Durand, Marguerite. Quelques souvenirs de compréhension enfantine du langage. [Memories of childhood understanding of language.] *J. Psychol. norm. pathol.*, 1960, 57(3), 253-256.—Several descriptions of a child's misunderstanding and interpretation of phrases containing yet unknown words.—M. L. Simmel.

835. Elkind, David. (U. California, Los Angeles) Children's conceptions of brother and sister: Piaget Replication Study V. *J. genet. Psychol.*, 1962, 100, 129-136.—210, 5-11-year-old children were tested in a systematic replication of Piaget's study of children's conceptions of brother and sister. There was generally good agreement between the original and replication studies with respect to the ages at which tests were passed and the kinds of responses obtained. In the present study, however, the results were given an interpretation different from the one offered by Piaget. According to the present paper, Piaget's tests measured not 1 development but 2: (a) class conception of "brother" and (b) the relational conception of "having-a-brother." The course of the 2 developments was traced in relation to success and failure on Piaget's tests. While both class and relation conceptions developed in 3 stages, the stages were different in character and appeared at different ages. It was concluded that the class and relational conceptions, associated with the same term can undergo quite different developments.—Author abstract.

836. Frankenstein, Carl. (Hebrew U., Jerusalem) Yaldut veoni. [Childhood and poverty.] Jerusalem, Israel: Hebrew Univer., Magnes Press, 1959. 20 p.—In the modern industrial society the personality of a child of poor, proletarian origin is likely to be disturbed. Also, the development of the child's innate intelligence will be normal only when inner and outer conditions of growing will permit it and promote internalization. Otherwise, a process of externalization will occur. Some brief educational and social hints are given.—H. Ormian.

837. Golan, Shmuel. Sugyot hakibuts. [Problems of the kibbutz.] Merhavia, Israel: Sifriyat Poalim, 1961. 287 p.—The 2nd (posthumous) volume of Golan's collected writings. The 1st part covers interpersonal relations, mores, and customs in kibbutz life. The 2nd part deals with the kibbutz family on the background of general changes in family life. The 3rd and 4th parts ("Between Youth and Adulthood" and "Youth in Israel and in the Kibbutz") contain some papers on psychological and sociological aspects of youth abroad and in Israel, especially in the kibbutz—juvenile crisis, love, the spiritual world of adolescents, recent crisis and the kibbutz youth, and education for the kibbutz.—H. Ormian.

838. Horowitz, Frances Degen. (U. Kansas) Incentive value of social stimuli for preschool children. *Child Develpm.*, 1962, 33(1), 111-116.—"It was hypothesized that in a lever pulling task preschool Ss would remain longer when the task involved seeing a picture of a best friend than when it involved seeing a picture of a neutral peer, which in turn would keep Ss longer than when they saw a blue light. Older and younger Ss were randomly assigned to the three treatment groups: light; neutral peer; best friend. The results indicated support for the hypothesis at the younger age level on two of the three experimental measures, mean time that Ss remained in the experimental situation and mean number of stimulus exposures. Age differences in rate of responding were indicated. Implications of the results were discussed."—W. J. Meyer.

839. Kezheradze, E. D. (Inst. Psychology, Akad. Nauk, Georgian SSR Tbilisi) K voprosu o genezise pis'ma v doskol'nom vozraste. [On the problem of the development of writing at the preschool age.] *Vop. psikh.*, 1961, No. 5, 99-108.—An investigation of the development of writing and, in particular, the question of whether drawing is an early stage of writing with all its symbolic significance. 2 children were systematically observed and 10 children occasionally observed with respect to any drawing or writing activity. The results of the observations suggest that drawing and writing are 2 entirely separate activities which may either develop separately or simultaneously. Writing develops as a symbolic activity representing speech; drawing develops as a symbolic activity representing objects.—H. Pick.

840. Koupernik, Cyril. Notions de stades de developpment dans l'oeuvre d'Henri Wallon. [Concepts of stages of development in the work of Henri Wallon.] *Evolut. psychiat.*, 1962, 27(1), 101-109.—Wallon's premise was that a valid theory of development could not be built solely on psychological formulations. However, a purely static description of successive stages was also held inadequate. His early correlations between pathological states of the brain and normal stages of development in children have been criticized. However, his concept of dynamic stages, starting with motor impulses and leading to social integration, has been considered one of the most comprehensive approaches to the problem of child development. (English summary)—L. A. Ostlund.

841. L'Abate, Luciano. (Washington U. School Medicine) Consensus of choice among children: A test of Piaget's theory of cognitive development. *J. genet. Psychol.*, 1962, 100, 143-149.—Children from kindergarten to 5th grade were given a multiple-choice picture story test. Up to the 2nd grade, there was an increasing trend to choose a particular picture in each set. No progressive increase was found after the 2nd grade—a finding that supports Piaget's view of development stages in cognitive functioning.—Author abstract.

842. Le Guillant, Louis. L'enfance inadaptee dans l'oeuvre d'Henri Wallon. [Maladjusted childhood in the works of Henri Wallon.] *Evolut. psychiat.*, 1962, 27(1), 121-139.—The publication by Henri Wallon of *L'Enfant Turbulent*, in 1925, marked a milestone in child psychology because the influence of the environment was emphasized. Previously, under the influence of Dupré, the concept of hereditary weakness was dominant. Wallon's other im-

portant contributions are mentioned, including objective studies of character and thought, and the elaboration of therapeutic procedures. (English summary)—*L. A. Ostlund.*

843. Levin, Harry, & Wardwell, Elinor. (Cornell U.) The research uses of doll play. *Psychol. Bull.*, 1962, 59(1), 27-56.—"Besides methodological studies the findings in five areas of investigation which have used doll play were summarized: aggression, stereotyping, doll preference, effect of separation from parents, and prejudice. Although certain groups of studies yield interrelated results, the use of this research tool has been so varied that the overall impression is of many disparate findings, in spite of the basic similarity in method. It is suggested that a conceptual difficulty underlying the studies has been the lack of distinction between wish fulfilling and replicative fantasies in children."—*W. J. Meyer.*

844. Noëting, Gérald. Recherches sur le développement des perceptions: XL. La structuration progressive de la figure Müller-Lyer en fonction de la répétition chez l'enfant et l'adulte. [Research on the development of perceptions: XL. Progressive changes in the perception of the Müller-Lyer figure as a function of repeated presentation to children and adults.] *Arch. Psychol. Genève*, 1960, 37, 313-413.—The Müller-Lyer figure was presented to children from 5 to 10 years old and to adults. The adjustment method was used without interruption, and repetition was continued until the Ss were tired. The size of the illusion was plotted as a function of the number of times the figure was presented. For 5- and 6-year-old children the initial value of the illusion was small, but the illusion increased with repetition. For 7-year-old children the illusion decreased with repetition, though the initial value was high. For older children also, the illusion decreased. These findings are discussed in relation to Piaget's explanation of the illusion.—*H. C. Triandis.*

845. Olson, Willard Clifford. Child development. (2nd ed.) Boston, Mass.: Heath, 1959. xi, 508 p. \$6.25.—The emphasis is on early, middle, and later childhood with some consideration of infancy and adolescence. Chapters 1 and 2 provide an introduction and overview of development. Chapters 3 and 4 are concerned with physical and motor development. Chapters 5 and 6 with mental and educational achievement. The child as a whole, his relations in the classroom and with his community, and his emotional life are handled in Chapters 7 through 10. "Chapters 11 through 14 present the implications of child development for the teacher . . . for curriculum experiences, for the administration of schools, and for a philosophy of development."—*E. Y. Beeman.*

846. Piaget, Jean. Le rôle de l'imitation dans la formation de la représentation. [The role of imitation in the formation of representation.] *Evolut. psychiat.*, 1962, 27(1), 141-150.—The concepts of Wallon and Piaget are declared similar by the latter, concerning the role of imitation as a link between sensory-motor functions and representational thought. Where Wallon stresses postural functions, Piaget stresses more specific motor functions as the source of subsequent intellectual activities. Where Wallon is more involved in descriptions of pictorial aspects of thought, Piaget is more interested in operational aspects of thought and their transformations, rather

than their patterns. (English summary)—*L. A. Ostlund.*

847. Ratson, Hava. Al hamaba haishi beshir-butehem shel yeladim ketanim. [Personal expression involved in little children's scribbling.] *Ofakim*, 1961, 15, 73-81.—"The first scribbles of a 2 year old have to be seen first of all as motor pleasure causing movements." Children's scribbling is analyzed and evaluated as a method in psychological diagnosis. 9 scribbles of 3 normal healthy children are given and analyzed as means of expression.—*H. Ormian.*

848. Rimerman, Yehuda. Mishmauto shel hat-seva betsiyurey hayeladim. [The significance of color in children's paintings.] *Urim*, 1960-61, 18, 598-602; 1961-62, 19, 84-86.—Recently the child's reaction to colors has been studied in the areas of discrimination of colors, their choice according to developmental stage, and the symbolic-diagnostic value of various colors. Color choice of children coming from different culture patterns in Israel was examined, and as result the value of "color was an [additional] intercultural test" is discussed.—*H. Ormian.*

849. Schenk-Danzinger, Charlotte. (Vienna) Social difficulties of children who were deprived of maternal care in early childhood. *Vita hum. Basel*, 1961, 4(4), 229-241.—34 children, all of whom had spent the 1st 3-4 years in an institution, were referred to the school psychological service because of learning and behavior difficulties. At the time of examination they had been living in their homes a minimum of 2 years. Most of the children, though of average intelligence, had shown retardation in language and in manual ability upon reaching school age. Much of their school difficulties seemed to stem from the fact that they had received little stimulation in the use of language and manipulation material. They also presented problems centered about retarded social development characterized by aggression, hostility, and inability to develop adequate interpersonal relationships.—*J. L. Yager.*

850. Sutton, R. S. (U. Georgia) An appraisal of certain aspects of children's social behavior. *J. teacher Educ.*, 1962, 13, 30-34.—The Syracuse Scale of Social Relations was administered to 90 5th-grade children. Student teachers observed children and kept anecdotal records of socializing experiences. Children tend to select members of their own sex for positive social roles and select peers as sources of help more frequently than members of the family or teacher.—*E. M. Bower.*

851. Tanaka, T. [Developmental study on the comparison of similarity of figures which change in direction and arrangement of elements: VIII. Through the recognition method.] *Jap. J. Psychol.*, 1962, 32, 388-394.—A comparison of the results of simultaneous choice and recognition methods in the study of figural similarity. For children, reversal figures rotated 180 degrees from the standard figure were preferred while adults preferred figures having minimal difference from the standard figure. Change to the adult pattern of recognition of similarity appears to occur around the age of 6 to 8.—*A. Barclay.*

852. Thompson, George G. (Ohio State U.) Child psychology: Growth trends in psychological adjustment. (2nd ed.) Boston, Mass.: Houghton Mifflin, 1962. xxi, 714 p. \$7.75.—This edition of a standard text in the field of child psychology has in-

corporated the main research findings which have appeared since the 1st edition was published a decade ago. The child is viewed as a dynamic, living and developing organism. The book emphasizes the importance of social and environmental factors on human development and theory and research instrumentation have been given more attention. The author's position is probably best stated in his own words; "Although I greatly admire the power and sheer beauty of a well-conceived theory, I am as yet unwilling to sacrifice embarrassing empirical relationships on its altar. I respect hard data, and I want the serious student of child psychology to know of their existence—even though they may constitute loose ends in this area of inquiry."—P. D. Leedy.

853. Wenar, Solveig Cederloo. (Northwestern U.) Simple concept formation in children as related to age level. *Dissert. Abstr.*, 1961, 21(11), 3518-3519.—*Abstract*.

854. Zazzo, René. La dialectique de l'intelligence dans l'oeuvre de Wallon. [Dialectics on intelligence in the works of Henri Wallon.] *Evolut. psychiat.*, 1962, 27(1), 161-173.—"Wallon is best known for his work on psychomotor development and emotion. His more recent work on the genesis of intelligence, in contrast with the work of Piaget, allows us to understand in a new light the originality of his conceptions. The problem of authors is to explain the passage from sensory-motor to discursive intelligence. But while Piaget is concerned with discovering the functional identity of intelligence, in its two aspects and at all stages, Wallon, on the contrary, is concerned with stressing the differences." According to Wallon's views, "speculative intelligence does not simply originate from sensory-motor intelligence. The passage from the one to the other requires new factors, anatomical and functional structures. Imitation is the activity which prepares this passage. Imitation implies participation to the model which relates it to sensory-motor intelligence; but it also operates a split between copy and model which prepares representation, that is discursive intelligence." (English summary)—L. A. Ostlund.

Learning

855. Baer, P. E., & Goldfarb, G. E. (Baylor U. Coll. Medicine) A developmental study of verbal conditioning in children. *Psychol. Rep.*, 1962, 10(1), 175-181.—Performance on a verbal conditioning task, in which Ss required to make up sentences were reinforced for beginning with the pronoun "I," was studied as a function of age and sex. "Boys and girls at the third, sixth, and tenth grade levels were Ss. Results show that the group as a whole conditions, but that significant differences occur between age and sex sub-groups. Two sex-linked developmental gradients are found, with boys decreasing and girls increasing in conditioning with age. The results are discussed in terms of experimenter effects and reinforcement history."—B. J. House.

856. Bandura, A., & Huston, Aletha C. (Stanford U.) Identification as a process of incidental learning. *J. abnorm. soc. Psychol.*, 1961, 63(2), 311-318.—If identification is a process of incidental learning, Ss should reflect greater adoption of behavior of individuals with whom they feel identified. Nursery school children were placed with an experimental model whose behavior they were to observe in

a learning situation (correct choice of 1 of 2 boxes in which a reward had been hidden). Prior to observation-learning, the children were placed with their "model" in 1 of 2 playroom situations: model friendly/model cold. Children exposed to the model behaving in a friendly way patterned their behavior (both as to discrimination in the learning situation as well as marching and verbal) to a greater extent than those exposed to a pre-test "cold" model. Aggressive behavior was imitated with or without model "warmth." Results related to child development.—G. Frank.

857. Di Vesta, Francis J. (Syracuse U.) Effects of mediated generalization on the development of children's preferences for figures. *Child Developm.*, 1962, 33(1), 209-220.—The general hypothesis examined is that a positive preference or attitude toward a previously neutral figure can be developed through mediated generalization. The Ss were 64 4th- and 5th-grade children who were randomly assigned to 2 experimental and 2 control groups. A B-C, A-B, A-C mediation sequences was used. It was concluded that originally neutral labels may gain secondary reinforcing properties which transfer and affect the preferences of other objects to which the labels are attached.—W. J. Meyer.

858. Kuvshinov, N. I. (Pedagogical Inst., Tomsk, USSR) Reshenie trudovykh zadach po pamyati bez opory na obrazets. [The solution of difficult memory tasks without the help of a model.] *Vop. Psikhol.*, 1961, No. 6, 55-62.—The present study was concerned with what kind of ideas a child obtains about a task before he begins work and how this influences his performance. Experiments were carried out on 2 groups of 2nd-grade children. They were required to make a paper object such as a house. Previous experiments had them do this with the object present. One group of children in the present study was shown how to make the object with a verbal explanation. The other group was merely shown the object. Both groups then had to make the object from memory. This was more difficult than the previous experiments, but was possible for the children. On the other hand, the errors and points of confusion made the children more aware of the various aspects of the problem so that on subsequent opportunities to look at the model they could correct their own mistakes.—H. Pick.

859. Patel, A. S. (Baroda, India) Distortion in perception and reproduction of figures as a function of mental set exercised by language labels. *Indian J. Psychol.*, 1961, 36(3), 119-125.—The Ss were 3 groups of 100 9th graders from Baroda, India. Boys and girls were equally represented in each group. Each of the 12 stimulus figures was designed to represent 2 common objects (e.g. spectacle, dumb-bell). Different name-labels were then associated with the same figures when presented to the 2 experimental groups; no names were given to the control group. The Ss were required to reproduce all 12 figures, in any sequence, after 1 to 3 presentations as may be required for complete reproduction. Judges rated accuracy of reproduction. Least distortion occurred in the control group, greatest in the 2 experimental groups and in the direction of the named objects, thereby confirming earlier results of Carmichael et al. on verbal, mental set, and perception. No significance sex differences occurred.—J. T. Cowles.

860. Rosenbaum, Milton E. (State U. Iowa) Effect of direct and vicarious verbalization on retention. *Child Developm.*, 1962, 33(1), 103-110.—"The present study examined the effect of verbalization at the time of observation of objects on recognition and recall one week later. The source of verbalization was varied to include self-verbalization and verbalization by others in the observer's presence. Vicarious verbalizers were either peers or the experimenter. Elementary school children served as Ss. Verbalization by all sources was found to facilitate recognition except in the case of self-verbalization in a chorus of 4. Recall measures yielded no differences among treatments."—W. J. Meyer.

861. Rubinstein, S. IA. Ovosptanii privychek u detei. [On the training of habits in children.] Moscow, USSR: RSFSR Academy Pedagogical Sciences, 1958. 39 p.—The author considers the origin of habits, the establishment of good ones, and the eradication of bad ones.—I. D. London.

862. Staats, Arthur W., Staats, Carolyn K., Schutz, Richard E., & Wolf, Montrose. (Arizona State U.) The conditioning of textual responses using "extrinsic" reinforcers. *J. exp. Anal. Behav.*, 1962, 5(1), 33-40.—"Six 4-year-old Ss were presented with a textual program consisting of 26 words arranged so the word stimuli were gradually combined into sentences and then short 'stories.' . . . The unit of response was the number of new texts acquired as a result of each of the 45-min experimental sessions. It was demonstrated that the program, procedure, and reinforcement conditions produced curves which are analogous to those produced in common operant-conditioning procedures."—Author abstract.

863. Staats, Carolyn K., Staats, Arthur W., & Schutz, Richard E. (Arizona State U.) The effects of discrimination pretraining on textual behavior. *J. educ. Psychol.*, 1962, 53, 32-37.—The study compared 3 groups (12 each) of kindergarten children in learning textual responses. Group 1 had discrimination pretraining with the same words as those in the criterion task, Group 2 with the letters making up these words, and Group 3 no discrimination training. The response analyzed was the number of correct anticipations in 10 trials of a 4-word task. Analysis of variance showed no difference between groups, but a Duncan new multiple range test indicated a significant difference between Group 1 and Groups 2 and 3, but not between the latter. Thus there was positive transfer to a later task involving the same stimuli, but this did not seem due to acquisition of an observing response to the components of the stimulus.—Journal abstract.

864. Takano, Seijun. [A theoretical study of the effect of success upon children's behavior: The effect of patterns and percentages of success and number of pre-experience trials on the maintenance of bar-pressing responses in unsuccessful situations.] *Jap. J. Psychol.*, 1962, 32, 367-380.—The experimental demonstrated that the number of pre-experience trials, the percentage of success, and the pattern of sequence had significant effects upon the number of children's bar-pressing responses in the unsuccessful situation; i.e., fewer pre-experience trials, smaller percentages of success, and irregular sequencing resulted in more bar-pressing responses in unsuccessful situations. Expectancy scores increased and de-

creased differentially as a function of the percentage of successes.—A. Barclay.

865. Włodarski, Z. Eksperymentalne badania pamięci u dzieci. [Experimental examination of the memory of children.] *Psychol. wycho.*, 1961, 4(4), 372-383.—The article reviews a series of projects that stressed the role of words in the process of memorizing which were carried out by students of the University of Warsaw. The experimental group was composed of 140 children (including 40 mentally retarded) who ranged in age from 2 to 14. The general conclusions were: (a) In preschool children, features of the object rather than its position helped recognition. As the experiment progressed, the color of the object became the determining factor. (b) Normal children showed greater resistance to distractions. Their mistakes were determined by the content of the word which accompanied the object. (c) Mentally retarded children were less influenced by previous perceptions and content of the word.—H. Kaczkowski.

866. Wohlwill, Joachim, & Lowe, Roland C. (Clark U.) Experimental analysis of the development of the conservation of number. *Child Developm.*, 1962, 33(1), 153-167.—This study is concerned with the processes operating in the development of the conservation of number. There were 4 conditions of training involving the role of reinforced practice on conservation, of dissociation of biasing perceptual cues, of the effects of addition and subtraction of elements, and a control group. Ss were 72 kindergarten-age children. Although there was an overall increase in nonverbal conservation responses, differences between conditions were not significant. Transfer of conservation learning to a verbal posttest was negligible under all conditions.—W. J. Meyer.

Abilities

867. Dodwell, P. C. (Queen's U., Canada) Relations between the understanding of the logic of classes and of cardinal number in children. *Canad. J. Psychol.*, 1962, 16(2), 152-160.—Children between the ages of 5 and 8 were studied to determine whether some understanding of hierarchical classes is a necessary condition for dealing appropriately with cardinal numbers. Answers to questions which involved simultaneous consideration of a whole class and its 2 component subclasses were compared to performance on the author's number concept test. Correlations were low.—R. S. Davidson.

868. Hebron, M. E. (U. Hull) A factorial study of learning a new number system and its relation to attainment, intelligence, and temperament. *Brit. J. educ. Psychol.*, 1962, 32(1), 38-45.—90 persons of both sexes, about 12 years of age and of average intelligence, learned a number system of 8 digits. Performance was related to personality and intellectual factors, height-weight, schooling, and assignment of roles by peers in a sociometric problem. 4 factors were identified.—B. T. Jensen.

869. Hill, S. D. Chronological age levels at which children solve three problems varying in complexity. *Percept. mot. Skills*, 1962, 14, 254.—Preliminary results concerned with establishing minimal CA levels for solution of 3 problems are reported. Object discrimination oddity, and conditional-oddity

were employed in a modified Wisconsin General Test Apparatus.—*W. H. Guertin.*

870. Krutetskii, V. A. (Akad. Pedagogicheskikh Nauk RSFSR, Moscow) *O nekotorykh osobennostyakh myshleniya shkol'nikov, malospobnykh k matematike.* [Concerning some characteristics of the thinking of pupils with little capacity for mathematics.] *Vop. Psikhol.*, 1961, No. 5, 77-89.—6th- and 7th-grade children with poor mathematical ability were identified by their teachers. From these were selected those who performed relatively well in other subjects. A series of quantitative and verbal tests were given these children and their performance analyzed. "The author has tried to see what role is played in this respect by the visual-imaginative and verbal-logical components in the structure of thinking. . . . 4 types of school children . . . [have been] identified, different as to the relative development [of the] . . . components of thinking. Each type is noted for its specific difficulties, while studying mathematics, and specific mistakes made by the pupil." Suggestions for helping such students are made.—*H. Pick.*

871. Price-Williams, D. R. (London School Economics) *Abstract and concrete modes of classification in a primitive society.* *Brit. J. educ. Psychol.*, 1962, 32(1), 50-61.—Literate and illiterate Bush children were given tasks of grouping animals and plants in as many ways as possible. They also performed sorting tasks. "Using familiar material which they have had an opportunity of manipulating, the evidence suggests that the growth in the capacity to reach the state of 'concrete operations' proceeds at a similar rate in both school and illiterate children." In both groups, the animal tasks showed a decrease of purely concrete reasons for grouping and an increase in abstract reasons. (19 ref.)—*B. T. Jensen.*

872. Torrence, E. Paul (U. Minnesota) *Problems of highly creative children.* *Gifted Child Quart.*, 1961, 5, 31-34.—From the compositions on divergent characters of 5000 elementary school children, several inferences were made about creative children, including sanctions against divergency and uneven development of academic skills. The creative children provided their own motivation for learning. Difficult tasks challenged them, raising the question of grade placement of instructional materials. They were portrayed as searching for meaning in life. Although alienated from their peers and teachers, they maintained a good sense of humor.—*N. M. Chansky.*

873. Zhyikov, S. F. (Akad. Pedagogicheskikh Nauk RSFSR, Moscow) *K probleme perenosy pri izuchenii grammatiki.* [On the problem of transfer in the study of grammar.] *Vop. Psikhol.*, 1961, No. 5, 90-98.—This investigation tried to ascertain whether work on identification of roots of words transferred to identification of suffixes. The investigation was carried out on 1st-grade pupils. Tests of ability to abstract suffixes were given before and after the regular school program covered identification of roots of words. The pretest indicated that the children were generally unable to distinguish a suffix from a root word. Great improvement in suffix identification was shown after the work on word roots. This improvement involved 1 of 3 kinds of transfer: identification of the root leaving the suffix

abstracted, transfer of the operation of abstracting roots to the abstraction of the suffix, and transfer of the operation of abstraction of roots to the abstraction of both roots and endings in more complex cases.—*H. Pick.*

Personality

874. Aronfreed J. (U. Pennsylvania) *The nature, variety, and social patterning of moral responses to transgression.* *J. abnorm. soc. Psychol.*, 1961, 63(2), 223-240.—Reactions to transgression in children was assessed through analysis of a story completion test given to 6th graders. The to-be-completed stories related themes of aggression by children against others which would usually be unacceptable to society. Stories were categorized re: degree of reliance on self or other as source of control. Mother's method of discipline was obtained through interview; the disciplinary methods were divided into the more physically punitive (hitting, yelling at) and the more psychological (withdrawal of love, explanation, etc.) Results demonstrated that in general 'moral behavior' was a function of anticipated external punishment. Self-criticism was viewed as an instrumental response related to such anticipation. Differences re: determinants of moral attitudes and consequent reliance on self or other were found in terms of socioeconomic level.—*G. Frank.*

875. Bandura, A., Ross, Dorothea, & Ross, Sheila A. (Stanford U.) *Transmission of aggression through imitation of aggressive models.* *J. abnorm. soc. Psychol.*, 1961, 63(3), 575-582.—In a previous study (see 37: 856) children imitated the behavior of a model in the presence of the model. The present study investigated the degree of imitation when the model was not present. Degree to which like-sexed model behavior would be followed was also studied. Nursery school children exposed to aggressively behaving models tended to imitate not only their aggressiveness but other behavior as well. There was some confirmation of like-sex imitation. The results were related to the psychoanalytic theory of identification.—*G. Frank.*

876. Bledsoe, Joseph C. (U. Georgia) *Sex differences in mental health analysis scores of elementary pupils.* *J. consult. Psychol.*, 1961, 25(4), 364-365.—". . . elementary school girls tend to rate themselves significantly higher on the Mental Health Analysis than do elementary age boys."—*E. R. Oetting.*

877. Commoss, Harriet H. (Teacher's Coll., Columbia U.) *Some characteristics related to social isolation of second grade children.* *J. educ. Psychol.*, 1962, 53, 38-42.—Some 20 children scoring in the highest quarter of their classes on a sociometric test were compared with 20 children in the lowest quarter with respect to the following characteristics: learning of sex role, certainty in interpersonal relationships, ability to communicate verbally, and eye-hand coordination. Positive relationships between social status and the stated characteristics were hypothesized. Each child copied a short sentence and was presented with the Driscoll Playkit and asked to complete 10 stories. Analysis of the data failed to support the hypothesis of a positive relationship between social acceptance and learning of own sex role but reliably supported the hypotheses related to the other characteristics.—*Journal abstract.*

878. Fawl, Clifford L. (Nebraska U.) **A developmental analysis of the frequency and causal types of disturbance experienced by children.** *Merrill-Palmer Quart.*, 1962, 8(1), 13-18.—Analysis of 12-day-study records from Barker's Midwest data revealed an average of 70 disturbances per record where the child experienced interference, failure, choice conflict, or other unpleasant disruption of feeling tone. Age of S correlated inversely with number of disturbances and socially evoked disturbances, and positively with average duration of disturbance.—E. L. Robinson.

879. Granick, Samuel, & Taylor, Joseph L. (Ass. Jewish Children, Philadelphia) **Prediction of adjustment in a group residence: A pilot study.** *J. Jewish communal Serv.*, 1962, 38(3), 304-311.—A report of an investigation to develop and establish criteria suitable for the prediction of the type of child who is most likely to benefit from admission to a boy's group residence. This preliminary study gives some indication that a rating scale covering the boy's attitude toward placement, his degree of social conformity, his emotional control, the history of his emotional relationship to his parents, their support of his placement, his psychosexual adjustment, his ability to use psychotherapy, and other factors is related to the degree of success or failure in adjustment to the environment of the group residence. Further studies on this as well as upon the degree to which modification of structure, staff, and equipment can be made in the residential environment are being continued.—M. A. Seidenfeld.

880. Hartley, Ruth E., Hardesty, Francis P., & Gorfain, David S. (Long Island U.) **Children's perceptions and expressions of sex preference.** *Child Developm.*, 1962, 33(1), 221-227.—As part of a larger project investigating children's concepts of women's roles, the present study has examined 2 sets of data in an attempt to determine empirically whether children perceive an adult partiality for males and whether any such partiality is reflected in children's expressions of their own sex preference. As a whole these findings seem to call into question the validity of the assumption that a culturally enforced partiality for males is generally operant in children's sex-role identification and development.—W. J. Meyer.

881. Institut für Jugendkunde und Jugendbildung. **Beiträge zur Diagnostik der Persönlichkeit.** [Contributions towards personality diagnosis.] Bremen, Germany: IJJ, 1961. 72 p. DM 4.80.—6 articles commemorate 50 years of existence of Bremen's Institute of Youth Investigation and Education. Topics covered are: chronicle of the Institute (T. Valentiner), mother and child (E. Noltenius), educational problems in children (G. Ehlers), an observation center for disturbed children (H. Schulte, L. Meyer, and M. Vogt), occupational aims and personality development in industrial and trade training (H. Dombrowsky), and treatment of strong- and weak-willed children (T. Valentiner). The demonstrations are partly statistical and partly based on individual case records.—J. C. Brengelmann.

882. Kanner, Leo. **Emotionally disturbed children: A historical review.** *Child Developm.*, 1962, 33(1), 97-102.—Prior to the 19th century there had been little interest in emotionally disturbed children

and it was not until the 1930s that systematic studies were made of severely disturbed children. A major problem emerging from this historical survey involves the meaningfulness of diagnostic categories and the need for greater specificity than that conveyed by the term "emotionally disturbed."—W. J. Meyer.

883. Kanous, Lawrence E., & Cohn, Thomas S. (Wayne State U.) **Relation between heterosexual friendship choices and socioeconomic level.** *Child Developm.*, 1962, 33(1), 251-255.—Using a partial-rank order sociometric procedure, children from Grades 2 through 8 were asked to make choices on 2 situations. Analyses of the opposite sex choices of boys and girls from 2 socioeconomic levels (high vs. low) indicated that more heterogeneous choices were made by the children from the lower socioeconomic group. The results contradict the idea that latency is a biogenetically determined phenomenon and suggest rather that it is at least partially determined by sociocultural influences.—W. J. Meyer.

884. Kitano, Harry H. **Adjustment of problem and nonproblem children to specific situations: A study in role theory.** *Child Developm.*, 1962, 33(1), 229-233.—"This study explored a hypothesis drawn from concepts derived from role theory. The findings indicate that, in situations where role expectations are clear, where there is consensus, and where role prescriptions are readily enforceable, there is a high degree of adjustment on the part of both 'normal' and 'problem' children. It also appears that the diagnosis of a 'problem child' is based on other evidence than that supplied by his or her behavior in this type of specific situation. It is suggested that an analysis of the total situation of the child, including the various demands and expectations placed on him, should be part of any definition of what constitutes a 'problem child.'"—W. J. Meyer.

885. Koch, Helen L. (U. Chicago) **The relation of certain formal attributes of siblings to attitudes held toward each other and toward their parents.** *Monogr. Soc. Res. Child Developm.*, 1960, 25(4, Whole No. 78), 134 p.—Representing a part of a study concerned with the effects upon the child's personality of various formal characteristics of his sibling, this unit reports responses to interview questions of 360 children, 5 and 6 years old, from 2-child, urban, native-born, white, intact families. Attitudes concerning the following are discussed: (a) association with the sibling, (b) quarrels, (c) parent alignments, (d) own and sibling's lot, (e) conditions contributing to stress, and (f) school. (56 ref.)—J. S. Braun.

886. Lynn, D. B. (U. Colorado) **Sex differences in identification development.** *Sociometry*, 1961, 24, 372-383.—This paper contains a theoretical formulation for sex differences in identification development, reviews relevant studies, and presents data generally supporting the position. The theory emphasizes early identification with the mother by both sexes, followed by an early shift to a masculine model by males and a late shift by females. Varied demographic data on public and private hospital patients are employed to support the position.—H. P. Shelley.

887. Maccoby, Eleanor. (Stanford U.) **The taking of adult roles in middle childhood.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 493-503.—The

relationship of reaction to transgression of adolescents and reaction to transgression in their families when they were age 5 was investigated. The Ss are part of a follow-up study (7 years later) on patterns of child rearing (Sears et al., 1957). Imitation of attitudes towards transgression was strongest in Ss whose families were highly nurturant. Sex differences in modes of acquiring rule-enforcing attitudes were found.—G. Frank.

888. Marui, Sumiko. A study on the Cloud Picture Test by children. *Tohoku psychol. Folia*, 1961-62, 20(3-4), 97-103.—The responses of young children are compared with those of adults. Whole responses are different from adults; there is little human response; the pattern is enumerative, not intuitive, and shows greater suggestibility. Children differ according to richness of content, degree of suggestibility, intuitive patterns, degree of form-binding, degree of imagination, and enumeration.—G. Rubin-Rabson.

889. Paivio, Allan. (U. New Brunswick) Personality, success and failure, and preferred degree of public exposure. *Bull. Maritime Psychol. Ass.*, 1961, 10, 50-58.—The technique of allowing a group of 155 children to individually determine the level of light intensity in which they would be exposed to an audience was tested for its reliability as a measure of, and its relation to, personality variables. The results indicated (a) a reliability of .82, (b) no effect of audience size, and (c) a significant tendency for Ss scoring high in audience anxiety to reduce the level of illumination after failure. Substituting a mirror for the audience, or allowing the Ss to manipulate the light intensity themselves, bore no significant relation to success or failure.—J. Bucklew.

890. Pareek, Udai. (National Inst. Education, New Delhi) Developmental patterns of Rosenzweig P-F Study variables in Indian children. *MANAS*, 1960, 7(1), 19-35.—Data from about 1000 children of ages 4-13 reveal interesting developmental trends in Indian children. The categories of extrapunitive and ego-defence, Factors E and I, superego patterns of E-E and M-I predominate all age groups. There is a trend in the decline of extrapunitive with increase in age, with a corresponding increase in intropunitive and impunitive. GCR scores readily rise at age 12 and 13. Decline of E with increase in age takes a bimodal form, the figure reaching very high at the age of 8 and suddenly declining at the age of 9. E and E-E also steadily decrease with advance in age. The various trends have been interpreted.—U. Pareek.

891. Peixotto, Helen E. (Catholic U.) Personality dynamics of American children as revealed by Despert fables (Düs Fables). *Vita hum.*, Basel, 1961, 4(4), 242-248.—The Despert fables (revised and expanded by Ruben Fine) have been found to constitute a satisfactory projective test for use with children 3-8 years of age. It is possible to derive from their production, dynamics of personality, particularly in the areas of rejection, hostility, and maturity. For example, with their use, the responses of clinic children have been found to be more characteristic of defense mechanisms than the responses of normal children. However, the fables do not appear to be adequate for differential diagnosis.—J. L. Yager.

892. Perry, Doris Cahoon. (U. Florida) Self-acceptance in relation to adjustment. *Dissert. Abstr.*, 1961, 22(1), 317-318.—Abstract.

893. Petrie, I. R. J. (Manchester Education Authority) Residential treatment of maladjusted children: A study of some factors related to progress in adjustment. *Brit. J. educ. Psychol.*, 1962, 32(1), 29-37.—23 maladjusted children in a special boarding school were observed for at least 12 months. Progress was compared with various test scores. Not all tests were equally reliable and valid in the sample; improvement was shown on all tests except WISC. Inconsistency in rate of improvement also appeared. (19 ref.)—B. T. Jensen.

894. Salfeld, D. J. Über kindliche Entfremdungserlebnisse. [The alienation experience in childhood.] *Acta paedopsychiat.*, Basel, 1962, 29, 33-40.—Feelings of depersonalization, derealization, and the like are unusual in children, and until puberty, occur only once in 200 cases. Prognosis for remission is good in $\frac{3}{4}$ of the cases—spontaneous cure taking place within weeks or months. Duration of symptoms is shorter than among adults. In addition to psychotherapy, change of environment is indicated. Alienation can be manifested in the presence of any degree of normality. In alteration of consciousness, anxiety is the essential factor producing alienation.—G. Rubin-Rabson.

895. Schneider, Shirley Chichester Sime. (U. Michigan) An analysis of presurgical anxiety in boys and girls. *Dissert. Abstr.*, 1961, 21(12), 3857-3858.—Abstract.

896. Sears, R. R. (Stanford U.) Relation of early socialization experiences to aggression in middle childhood. *J. abnorm. soc. Psychol.*, 1961, 63(3), 466-492.—A follow-up study (7 years after) on the Ss in the original investigation on patterns of child rearing (Sears et al., 1957). Parental attitude towards child rearing and attitudes towards aggression when S was 5 were related to patterns of aggressive behavior and attitudes toward aggression expressed by Ss at age 12. The manner of expressing aggression was seen to be a function of sex of the child and specific familial attitudes.—G. Frank.

897. Stewart, Lawrence H. (U. California, Berkeley) Relationship of two indices of interest stability to self satisfaction and to mother-son identification. *Calif. J. educ. Res.*, 1962, 13(2), 51-56.—29 boys who had taken the Strong Vocational Interest Blank as high school juniors and seniors and again 2½ years later, had, at the 1st testing, made Q sorts on immediate self-perception, on ideal self-perception, and on how they thought their mothers would like them to be. Their mothers also sorted in terms of how they perceived their sons and what they would like them to be. Intercorrelational analysis failed to suggest identification in SVIB patterning.—T. E. Newland.

898. Stith, Marjorie, & Connor, Ruth. (Florida State U.) Dependency and helpfulness in young children. *Child Developm.*, 1962, 33(1), 15-20.—"A time-sampling technique and predetermined categories were utilized to determine the frequency and proportions of helpful and dependent behavior exhibited by 65 preschool children during 1300 2-minute observations. While, as age increased, dependent contacts with adults decreased in both frequency and

proportion, helpful contacts with both adults and children increased significantly. Although dependent contacts with children also increased with the age of the initiator, this change was not statistically significant. The sex of the initiator was not significantly related to either helpful or dependent contacts with either adults or children."—*W. J. Meyer.*

899. Wolff, Sulamith. (Jewish Hosp. Brooklyn) Social and family background of pre-school children with behaviour disorders attending a child guidance clinic. *J. child Psychol. Psychiat.*, 1961, 2(4), 260-268.—43 children were studied to determine how they differed from a national sample of children of similar age. No significant differences were found in occupational class of fathers, employment of mothers, overcrowding in the home, family size, ordinal position, maternal age, and broken homes. 2 factors appeared significant: (a) the parents had experienced deprivation, i.e., loss of one or both of their parents, in their own childhoods; (b) there was a high incidence of psychiatric disturbance in these parents.—*J. M. Reisman.*

900. Wolff, Sulamith. (Jewish Hosp. Brooklyn) Symptomatology and outcome of pre-school children with behaviour disorders attending a child guidance clinic. *J. child Psychol. Psychiat.*, 1961, 2(4), 269-276.—43 children were evaluated 3-6 years following their 1st visit. Most initially presented symptoms were no different from the range of behavior usually found at their age. At follow-up, all types of symptoms had become less frequent with a marked decline in aggressive symptoms in boys and phobic symptoms in girls. On all measures of outcome, boys were assessed as more disturbed than girls. No direct relationship was found between outcome and the number of visits to the clinic.—*J. M. Reisman.*

Parent-Child Relations

901. Anthony, E. James. (Washington U. School Medicine, St. Louis) Impressions of research on parental attitudes and child behavior from the point of view of a psychiatrist. In John C. Glidewell (Ed.), *Parental attitudes and child behavior* (see 37: 913). Pp. 149-153.—Although much research and theorizing has been developed, very little in the way of fresh or original ideas have emerged.—*W. J. Meyer.*

902. Arnon, Yosef. Hahorim vehayeladim begil haneurim bakibuts. [Parents and adolescent children in the kibbutz.] *Ofakim*, 1961, 15, 28-36.—In the summer of 1960 a questionnaire was administered to 7th-12th graders in 6 district kibbutz schools and at the same time to their parents. The aim was to find out "how parents see their children within the framework of kibbutz education and how children evaluate their parents." The main questions asked were: how many times a week do you visit your parents in their rooms, does your child visit you in your room, and is this number of visits sufficient in your opinion. The answers make possible an examination of parent-adolescent conflicts and an evaluation of educating factors (parents, educators, friends) and the educational method accepted in the kibbutz.—*H. Ormian.*

903. Bettelheim, Bruno. *Dialogues with mothers.* New York: Free Press, Glencoe, 1962. 216 p. \$3.50.—

"This book is not a practical guide to child care" but "is meant for those who have read the books and find that the books disagree or don't quite fit their own child and his problem." Consisting of reports of group discussions with parents, this book is basically concerned with "getting them [parents] to analyze a particular situation in their own words, on the basis of their own anxieties, notions and ideas." The recurring question asked of these parents is "what kind of child do you want?"—*J. Walters.*

904. Bronfenbrenner, Urie. (Cornell U.) The changing American child: A speculative analysis. *J. soc. Issues*, 1961, 17(1), 6-17.—An analysis of changes in child-rearing over the past 25 years suggests that parents are becoming more permissive, freer in expression of affection, more inclined to use indirect disciplinary techniques (appeals to reason or to guilt), and that the father tends to be more affectionate and less authoritarian. These phenomena seem to prevail in all social classes so that class differences in child rearing are less distinct. Although such love-oriented techniques are effective in producing well-socialized behavior, they tend to produce adjustment patterns characterized by conformity, anxiety, and diminished aggressiveness. Implications of these observations are discussed.—*A. Barclay.*

905. Bronfenbrenner, Urie. (Cornell U.) Toward a theoretical model for the analysis of parent-child relationships in a social context. In John C. Glidewell (Ed.), *Parental attitudes and child behavior* (see 37: 913). Pp. 90-109.—The concept of optimal level "implies a curvilinear relationship between either parental affection or authority on the one hand and child behavior on the other. . . . At the same time, the critical level—the maximum, the point on the graph at which the slope of the curve changes from positive to negative—is presumed to occur at different levels of parental behavior for the two sexes and to appear at lower levels for girls than for boys." Data showing the relationship between parental power serve as empirical support of the optimal level notion.—*W. J. Meyer.*

906. Brown, Mortimer. (Vanderbilt U.) Attitudes and personality characteristics of mothers and their relation to infantile colic. *Dissert. Abstr.*, 1961, 22(1), 319.—*Abstract.*

907. Bunch, Marion E. (Washington U., St. Louis) Impressions of research on parental attitudes and child behavior from the point of view of a psychologist. In John C. Glidewell (Ed.), *Parental attitudes and child behavior* (see 37: 913). Pp. 154-158.—The conference has provided excellent techniques for the identification of parental attitudes. What is needed now is an examination of how these attitudes are translated into parental behaviors and in turn how the child's behavior is influenced by these procedures. Similarly, there is a need to study how the child's behavior influences parental behavior.—*W. J. Meyer.*

908. Cass, Loretta K., & Wessen, Albert F. (Washington U., St. Louis) Determinants of parental attitudes. In John C. Glidewell (Ed.), *Parental attitudes and child behavior* (see 37: 913). Pp. 207-214.—Recent research suggests that the distinction between intrapsychically and environmentally located variables is artificial and that both are important in any study of the source of parental atti-

tudes. Thus, the origins of parental attitudes can be traced to definable aspects of the parents' experience and we should examine the specific way in which one's broad cultural background affects this experience. The variable of social class is analyzed as an example of this approach.—*W. J. Meyer.*

909. **Emmerich, Walter.** (Purdue U.) **Variations in the parent role as a function of the parent's sex and the child's sex and age.** *Merrill-Palmer Quart.*, 1962, 8(1), 3-11.—For middle-class parents of children ranging in age from 6 to 10 years, a questionnaire study of parental role characteristics showed that mothers were more nurturant and less restrictive than were fathers. Parents exerted more power toward same-sex than toward opposite-sex children. A finding of cyclical variation in parental nurturance-restriction as a function of the child's age is interpreted with caution.—*E. L. Robinson.*

910. **Fanshel, David, & Maas, Henry S.** (Child Welfare League America, NYC) **Factorial dimensions of the characteristics of children in placement and their families.** *Child Developm.*, 1962, 33(1), 123-144.—All of the 882 children constituting the sample, had been separated from their families and placed in agency-supervised families or institutions for foster care or adoption. These children were placed because of their dependency and not because of illness or delinquency. Data on the children and their families were factor analyzed. Long time care was found to be one factor of considerable importance to the children's sense of self-identity.—*W. J. Meyer.*

911. **Farber, Bernard.** (U. Illinois) **Marital integration as a factor in parent-child relations.** *Child Developm.*, 1962, 33(1), 1-14.—The generally low correlations between indices of marital relations and the adequacy of parent-child interactions may be attributable to inappropriate indices for probing the marital relationship. A sample of 109 families, all of which had at least one normal child, aged 11-16, and 1 retarded child, were administered 5 inventories which measured marital integration as well as parental perceptions of their children. It was concluded that the more direct measures of parental perceptions of their children along with indices of marital relations provide a productive approach to understanding parent-child interactions.—*W. J. Meyer.*

912. **Glidewell, John C.** (Washington U., St. Louis) **On the analysis of social intervention.** In John C. Glidewell (Ed.), *Parental attitudes and child behavior* (see 37: 913). Pp. 215-239.—"Intervention occurs whenever a new class of objects, organisms, persons, feelings, ideas, skills are introduced or an old one withdrawn; whenever new ways of involving resources are introduced or old ones withdrawn." The ways in which parents and children might influence each others behavior is examined in terms of the social intervention notion.—*W. J. Meyer.*

913. **Glidewell, John C. (Ed.)** (Washington U., St. Louis) **Parental attitudes and child behavior.** Springfield, Ill.: Charles C Thomas, 1961. xx, 253 p. \$8.50.—The contributions to this volume, (see 37: 901, 905, 907, 908, 912, 914, 915, 916, 919, 923, 927, 931, 1344, 1920) had been originally presented at a workshop-type conference conducted by the Social Science Institute of the Washington University of

St. Louis. In Section I, original research relevant to maternal attitudes and behavior is presented. Section II is concerned with the current status of research in this area and needs for future research. Section III consists of papers prepared after the conference which were designed to contribute to the definition of problems and to the development of proposals for the next phases of contribution toward a science of parent-child relations.—*W. J. Meyer.*

914. **Gouldner, Alvin W.** (Washington U., St. Louis) **Impressions of research on parental attitudes and child behavior from the point of view of a sociologist.** In John C. Glidewell (Ed.), *Parental attitudes and child behavior* (see 37: 913). Pp. 159-164.—Despite the high level of technical sophistication in the construction of paper-and-pencil tests there is a need for studies in naturalistic settings. There is a need for "more studies which are concerned with the identification of differing modes of organization of the American family, with an effort to relate these, and their different needs to the consequent patterns or problems manifested in child behavior."—*W. J. Meyer.*

915. **Grant, Quentin Rae, & Kantor, Mildred B.** (Washington U. School Medicine, St. Louis) **Some limitations of the effects of maternal attitudes on child behavior.** In John C. Glidewell (Ed.), *Parental attitudes and child behavior* (see 37: 913). Pp. 183-187.—Research on parent attitudes and child behavior should "take the behavior of the child as the dependent variable and to study the effect of the attitude-behavior-perception complex on it; and to study the relationship defined above in terms of the following factors: (a) personal factors, such as health and childhood influence; (b) socio-cultural factors, such as economic position . . . and (c) family factors, such as the number of children, age of children."—*W. J. Meyer.*

916. **Hamblin, Robert L., & Vanderplas, James M.** (Washington U., St. Louis) **Some notes on the strategy of research.** In John C. Glidewell (Ed.), *Parental attitudes and child behavior* (see 37: 913). Pp. 188-206.—"We have proposed that the goal of research on parent-child relations is to isolate the controlling variables which account for the major portion of variation in parent-child relations. We have proposed that this goal can be better approached by 1) further developing reliable definitions of the concepts used to identify the significant variables, 2) attend to methods of increasing the reliability of measuring devices, but 3) budgeting theory development and data collection to provide better balance and greater opportunity for creative theory development based on data, 4) quantitatively assessing the proportionate degree of specific multivariate relations, and 5) employing experimental methods to demonstrate causation."—*W. J. Meyer.*

917. **Hartup, Willard W.** (State U. Iowa) **Some correlates of parental imitation in young children.** *Child Developm.*, 1962, 33(1), 85-96.—Having developed a measure of like-sex parental imitation in preschool children, the relation of this measure to sex-typing, sex of child, CA, and maternal attitudes was explored. The Ss were 29 girls and 34 boys, ages 3-6 and 5-6. A significant relation between imitation of the like-sex parent and appropriate sex-typing was found for girls, but not for boys. 3 maternal attitude scales reflecting authoritarian at-

titudes toward children and family life were positively related to girls' imitation of the mother. Maternal attitudes reflecting authoritarian, intrusive or suppressive attitudes were related to imitation of the father by boys.—*W. J. Meyer.*

918. Heilbrun, Alfred B., & McKinley, Roger. (State U. Iowa) **Perception of maternal child-rearing attitudes, personality of the perceiver, and incipient psychopathology.** *Child Developm.*, 1962, 33(1), 73-83.—The hypothesis that the child-rearing attitudes attributed to their mothers by young daughters with presumed incipient psychopathology will be more deviant than the perceived attitudes of young normal daughters was supported. The data are based on differences in perception of mother as seen by one group of college females who showed abnormal elevations on the MMPI with a group of college females who did not.—*W. J. Meyer.*

919. Hunt, Raymond G., & Winokur, George. (Washington U. School Medicine, St. Louis) **Some generalities concerning parental attitudes with special reference to changing them.** In John C. Glidewell (Ed.), *Parental attitudes and child behavior* (see 37: 913). Pp. 174-182.—Attitudes can be expressed behaviorally in a variety of specific ways. Research should be directed toward categorizing such behaviors and examining their influence on child behavior. Approaches to modifying parent behavior and, subsequently, parent attitudes, are explored.—*W. J. Meyer.*

920. Kelley, H. H., & Ring, K. (U. Minnesota) **Some effects of "suspicious" versus "trusting" training schedules.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 294-301.—The structure of child training was translated into the paradigm of learning in a human engineering situation. The parent is conceived as having a role for the trainee (the child) to learn and employs a schedule of reinforcement. The "suspicious" training schedule involved the trainer always assuming an incorrect response has been given, and uses punitive action (electric shock); "trusting" schedule assumes a correct response, reward being a green light to proceed. Ss were college students; the task involved deciding which of 2 statements reflected greater psychopathology. S had the choice of revealing his selection or not. The hypothesis was that the S exposed to the "suspicious" routine would be more inclined to bring his response to the attention of the evaluator to correct the impression of being wrong, and to more readily learn to adopt trainers' frame of reference. In general, the results support the hypotheses.—*G. Frank.*

921. Lavin, David Edwin. (New York U.) **Parent decision processes in child rearing: A comparison of individual and group performance.** *Dissert. Abstr.*, 1961, 21(10), 3182-3183.—*Abstract.*

922. Lefkowitz, M. M. (Rip Van Winkle Found., Hudson, N. Y.) **Some relationships between sex role preference of children and other parent and child variables.** *Psychol. Rep.*, 1962, 10(1), 43-53.—Norms for 421 boys and 403 girls were established on a Games and Activities Preference List (GAP). A number of variables were compared for deviant and nondeviant sex role preference groups. Significant findings were that nondeviant boys have nurturant mothers, discipline by both parents, higher social status, higher intelligence, and higher identification

with own sex than deviant boys. Several hypotheses were discussed in relation to the data.—*B. J. House.*

923. Loevinger, Jane, & Sweet, Blanche. (Washington U. Medical School, St. Louis) **Construction of a test of mother's attitudes.** In John C. Glidewell (Ed.), *Parental attitudes and child behavior* (see 37: 913). Pp. 110-123.—The Family Problems Scale, a partially disguised objective test intended primarily for use with mothers, yields 4 homogeneous clusters of attitudes: authoritarian Family Ideology (AFI), Conventionality-Anxiety (C-A), Orderliness, and Rejection of Woman's Biological Role (RB). Of the 4 clusters, AFL is by far the most salient both statistically (it has the highest coefficient of homogeneity) and in terms of the psychological implications of the attitudes for child rearing practices.—*W. J. Meyer.*

924. Lynn, R., & Gordon, I. E. (Exeter U.) **Maternal attitudes to child socialization: Some social and national differences.** *Brit. J. soc. clin. Psychol.*, 1962, 1(1), 52-55.—As in the United States, middle-class mothers were found to be more permissive and less punitive in socializing their children than working-class mothers. British mothers as a whole were found to be less permissive and more punitive than American mothers.—*C. M. Franks.*

925. Platt, Henry; Jurgensen, Gretchen, & Chorost, Sherwood B. (Devereux Found., Devon, Pa.) **Comparison of child rearing attitudes of mothers and fathers of emotionally disturbed adolescents.** *Child Developm.*, 1962, 33(1), 117-122.—"Normative data for the Inventory of Family Life and Attitudes, an adaptation of the Parental Attitude Research Instrument (PARI), was compiled for a population consisting of 129 mothers and 132 fathers of adolescents, with behavioral and educational adjustment problems, in residential treatment at the Levereux Schools. Significant differences were found between the scores of mothers and fathers on 12 of the 23 scales of the Inventory. Attitudes of Authoritarian Control and Parental Warmth were compared for the fathers and mothers. The Authoritarian Control scores for fathers were significantly higher than those of mothers. No significant difference was found between Parental Warmth scores of mothers and fathers."—*W. J. Meyer.*

926. Robbins, Lillian Cukier. (New York U.) **Parental recall of aspects of child development and of child-rearing practices.** *Dissert. Abstr.*, 1961, 22(1), 348.—*Abstract.*

927. Schaeffer, Earl S. (National Inst. Mental Health, Bethesda, Md.) **Converging conceptual models for maternal behavior and for child behavior.** In John C. Glidewell (Ed.), *Parental attitudes and child behavior* (see 37: 913). Pp. 124-146.—"A number of researches that appear to be converging upon similar parsimonious conceptual models for the universes of maternal behavior and social emotional behavior of the child have been reviewed here. A law of neighboring has been used to develop organizations of several sets of data. A hypothetical conceptual model for maternal behavior, with reference dimensions of love-hostility and autonomy-control, has been proposed."—*W. J. Meyer.*

928. Srivastva, Suresh Chandra. (U. Michigan) **Intergenerational transmission of motives.** *Dissert. Abstr.*, 1961, 21(12), 3876-3877.—*Abstract.*

929. Stein, Jean F., & Longnecker, E. D. (Philadelphia Child Guidance Clinic) **Patterns of mothering affecting handicapped children in residential treatment.** *Amer. J. ment. Defic.*, 1962, 66 (5), 749-757.—The Parental Attitude Research Instrument was administered to 115 child-care staff members of a residential school for retarded, brain-damaged, and emotionally disturbed children, and to 37 mothers of children in residence. A comparison of own mothers and mother substitutes on each of 23 subscales showed a consistent difference of opinion among groups on all the 16 Factor A (Authoritarian-Control) scales. Own mothers and psychiatric staff members were least in favor of authoritarian-controlling attitudes; teachers, unit supervisors, and nurses were next; and housemothers and attendants were most in favor. Absolute mean differences were smaller, and the rankings of high- and low-scoring groups were less consistent, for the scales making up the other 2 factors: Factor B, (Hostility-Rejection), and Factor C (Democratic Attitudes). Analysis of attitudes did not support the assumption that the children met a uniformly lower level of achievement demand in parent substitutes at school. Instead, they pointed to important discrepancies among the kinds of achievement expected by own parents and parent substitutes of different ages and educational backgrounds.—V. S. Sexton.

930. Stineman, William Frederick. (St. Louis U.) **An analysis of urban and rural boys' evaluation of their fathers.** *Dissert. Abstr.*, 1961, 21(10), 3184.—Abstract.

931. Stringer, Lorene A., & Pittman, David J. (St. Louis County Health Dept., Mo.) **The unmeasured residual in current research on parental attitudes and child behavior.** In John C. Glidewell (Ed.), *Parental attitudes and child behavior* (see 37: 913). Pp. 167-173.—A factor considered of major importance which has been lacking in parent attitude research concerns the parents' experiences with their own parents. Thus a major determinant of parent-child relations may well be the quality of the parent-grandparent relationship.—W. J. Meyer.

932. Tyler, Forrest B., Tyler, Bonnie B., & Rafferty, Janet E. (Southern Illinois U.) **Need value and expectancy interrelation as assessed from motivational patterns of parents and their children.** *J. consult. Psychol.*, 1961, 25(4), 304-311.—A complex process of scoring by example is developed to rate need value and expectancy for 45 children and 90 parents. Intercorrelations indicate that need value and expectancy are specific to the need category under study and to age and sex of Ss.—E. R. Oetting.

933. Vincent, Clark E. **Unmarried mothers.** New York: Free Press Glencoe, 1961. x, 308 p. \$6.00.—Results of a study of 736 unwed mothers drawn from private practice (175), a Salvation Army maternity home (189), and a county hospital (372) in Alameda County, California, during 1954. Ss were studied in relation to: socioeconomic, age, racial, and educational variables; personality patterns; familial factors; and adoption aspects. (193 ref.)—D. G. Brown.

934. Yampey, Naim, & de Hojman, Raquel K. **La relación materno-filial en el periodo del recién nacido: Investigación por medio de entrevistas grupales.** [The mother-child relation in the post-

natal period: An investigation by means of group interviews.] *Acta neuropsiquiat. Argent.*, 1961, 7(3), 184-186.—Mothers were organized into discussion groups of 6. The results of the discussions over a period of 6 months are presented. Such groups should be incorporated into every maternity service, since they perform a valuable prophylactic function for the future mental health of the child by correcting initial defects in the mother-child relation and by helping to resolve difficulties arising from maternal conflicts and inexperience.—W. W. Meissner.

935. Zurich, Michael. (Texas Woman's U.) **Relationship between maternal behavior and attitudes toward children.** *J. genet. Psychol.*, 1962, 100, 155-165.—This study sought to test the hypotheses that (a) maternal attitudes toward children are related to selected behaviors of mothers, observed in interaction with their children and (b) maternal behavior is independent of the sex of the child with whom the mother interacts. The Ss were 40 middle-class mothers who were white, American born, 20-35 years old, and full-time homemakers. Laboratory observations of mother-child interaction were conducted through a 1-way vision mirror in the child study laboratory at Texas Woman's University. Each mother-child pair came to the laboratory for a 30-minute period of observed interaction, recorded under predetermined categories. Of the 272 comparisons made by means of Spearman rank correlation coefficients computed between frequencies in the 17 maternal behavior categories and the 16 attitude subscales, 12 evidenced significant relationships at the .05 level or beyond. Of the 17 behavior categories, only 2 showed a significant relationship ($P < .05$) with the sex of the child when the median test was applied to frequencies of maternal contacts with sons and daughters.—Author abstract.

ADOLESCENCE

936. Amatora, Mary. (St. Francis Coll., Fort Wayne, Ind.) **Home interests in early adolescence.** *Genet. Psychol. Monogr.*, 1962, 65, 137-174.—A study of home interests in early adolescence was based upon replies of 674 boys and girls in 12 schools in 10 different states in widely separated geographical regions of the United States. Data were analyzed according to 1st, 2nd, and 3rd choices of interest; according to grade level; and according to sex. 23 categories of interest emerged for the boys, and 21 for the girls. For the boys, the 10 highest ranking interests were television, family, hobbies, play, radio, pets and animals, work, sports, reading, and food in that order. Rank order of the highest 10 for girls were television, work, cooking, family, hobbies, reading, radio, baby-sitting, play, and music.—S. M. Amatora.

937. Bril, F. (Mental Health Clinic, Ramat Hen) **Beayot nafshiyot begil hahitbagrut.** [Mental problems in adolescence.] *Dap. refuim*, 1961, 20, 475-480.—Psychology and psychopathology as well as treatment methods in the adolescent period are summarized from the psychoanalytical point of view; adolescence is explained as an existential problem. The therapeutic approach is explained on the basis of seeing adolescence as a period of crisis. (English & French summaries)—H. Drmian.

938. Dechêne, Hans C. (Theresienstr. 25, Munich, Germany) **Über jugendlichen Reisedrang.** [On

the youthful urge to travel.] *Z. exp. angew. Psychol.*, 1961, 8(4), 461-507.—Questionnaires and short essays revealed a stronger urge to travel in the younger group (age 15) than in the older group of Ss (age 19). In both groups 3 motives, not mutually exclusive, were clearly distinguishable: a general tendency to be some other place, tension within the ego and search for the "you," and an attempt to accelerate maturation.—*W. J. Koppitz*.

939. de Radelli, Amalia L., & Zac de Filc, Sara. *Problemática y desarrollo psicosexual del joven*. [Psychosexual problems and the development of youth.] *Acta neuropsiquiat. Argent.*, 1961, 7(3), 188-190.—Study of several groups of secondary school students suggests that the lack of integration between the affective and sexual spheres reflects the need for: (a) better knowledge of sexuality, integrated within the framework of the family, education, and society; (b) control of sexual conduct, recognizing that the norms of previous generations were regressive and accepting greater sexual liberty based on scientific knowledge and acknowledgement of sex in its totality; (c) elimination of taboo attitudes in communicating about sex; and (d) a clear distinction between sexual promiscuity and sexual liberty.—*W. W. Meissner*.

940. Elitsur, Barukh, & Pade, Benjamin. *Hagoremim hakeshurim bahalikhat noar lemoaddon shekhunati*. [Factors connected with youth attendance at a quarter club.] *Megamot*, 1962, 12, 89-91.—A survey carried out on a random sample of 275 children 10-16 years old. Inasmuch as the club is considered interesting and the children are socially active, the probability of attendance is high. The amount of free time and family background do not influence attendance. (English summary)—*H. Ormian*.

941. El Koussy, A. H. (Cairo, Egypt) *The characteristics of rural and urban adolescents in Egypt*. *World ment. Hlth.*, 1961, 13(1), 15-20.—Attitudes toward self and environment, and aims and expectations were content-analyzed from protocols of 800 students in rural and urban areas. It was found that "urban groups . . . are similar. . . . breakaway from the family starts earlier with boys than with girls and earlier with urbans than with rurals. . . . there is on the whole adherence to the family which tends to be both protective and domineering . . . respect for older members of the community and deep regard for parents and the family. . . . self evaluation reflects more or less traditional standards . . . than comes from the standards derived from peers."—*J. C. Franklin*.

942. Garelli, Maritha, & Pousseur, Nicole. *Image de soi, image des autres chez l'adolescent*. [Image of the self and of others among adolescents.] *Enfance*, 1961, No. 4-5, 313-380.—Selected TAT plates were used with 60 males and 60 females, ages 13-20. Protocols were analyzed in terms of objects, persons, content, relations, and the Ss' relations to the task. Baumgarten's proverbs test was used with 30 boys and 24 girls, ages 14-18. All Ss had had poliomyelitis. Results are tabulated extensively, sample protocols and profiles are presented, and numerous tentative inferences are made. Major conclusions are that males are chiefly concerned with their occupational future and their adaptation to society. They know too little about occupational opportunities, are fearful of society, and are uncertain. Girls are less

concerned with their vocational future and more with self-actualization. Both boys and girls have high levels of aspiration and an inclination to distrust themselves.—*S. S. Marzolf*.

943. Harmin, Merrill. (New York U.) *Have adolescents changed? A consideration of possible changes in adolescents in recent years*. *Dissert. Abstr.*, 1961, 21(10), 3181.—*Abstract*.

944. Khanna, Adarsh. (National Inst. Education, New Delhi) *A study of friendship in adolescent boys and girls*. *MANAS, Delhi*, 1960, 7(1), 3-18.—300 adolescents of mean age 13.5 years were administered a questionnaire. Growth in age is characterized by narrowing of the wide circle of friends. Early adolescence is characterized by friendship with the same sex. Talking together is the most common occupation of friends. Factors in the formation of friendship are: similar socioeconomic status, similar achievement, same age and same neighborhood. Traits emphasized both by boys and girls for social acceptance were: clever in studies, good nature, honest, kind, helping nature, same age, social nature, good habits, cheerful nature, same school subject, good singer, sympathetic, beautiful. (25 ref).—*U. Pareek*.

945. Khanna, Adarsh. (National Inst. Education, New Delhi) *A study of social rejection in adolescent boys and girls*. *MANAS, Delhi*, 1960, 7, 45-65.—"The investigation has covered 300 adolescent boys and girls reading in 8th and 9th grades. The factors responsible for the rejection of the peers have been discussed in relation to the socio economic status, age and sex. . . . a significant percentage of girls see teachers and parents as interfering in their rejection of the peers."—*U. Pareek*.

946. Lief, Harold I., & Thompson, William G. *The prediction of behavior from adolescence to adulthood*. *Psychiatry*, 1961, 24(1), 32-38.—Predictions on the adult adjustment of 17 Negro youths made by 2 psychiatrists on the basis of material obtained in 1938 by Allison Davis and John Dollard (*Children of Bondage: The Eighth Generation*) were checked against the findings of a 15-year follow-up. Methodological problems in prediction research are discussed. Results are illustrated by 2 case reports. Errors resulted primarily from overlooking or underestimating personality strengths.—*C. T. Bever*.

947. Livson, Norman, & McNeill, David. (U. California, Berkeley) *Physique and maturation rate in male adolescents*. *Child Developm.*, 1962, 33, 145-152.—"With a sample of 177 males drawn from 3 longitudinal growth studies, an attempt was made to replicate earlier reports that maturation during adolescence proceeds more rapidly for mesomorphs than for ectomorphs. Using subgroups of contrasting somatotypes, the obtained differences in age at reaching 90% of mature height (an index of maturation rate) is consistent in direction with the previous work but of small and insignificant magnitude."—*W. J. Meyer*.

948. Nixon, Robert E. *An approach to the dynamics of growth in adolescence*. *Psychiatry*, 1961, 24(1), 18-31.—Psychiatric observation of 600, psychologically normal, female Vassar College students revealed an organic developmental step during mid-adolescence: "the advent of self-cognition." Illustrated by 3 case histories, this hypothesis is placed

in its theoretical perspective and is proposed as the basis for a 3-part typology of "acceptors," "compilers," and "rebels."—C. T. Bever.

949. Peck, R. F., & Galliani, C. (U. Texas) **Intelligence, ethnicity and social roles in adolescent society.** *Sociometry*, 1962, 25(1), 64-72.—"The general purposes of this study were to investigate the relationship of intelligence to social visibility, the differentiation of different social role groups according to their intelligence, and the possibility of ethnic influences on such social visibility. Three Texas communities supplied the sample of 1217 eighth-grade boys and girls both Anglo-American and Latin-American." Intelligence is generally associated with visibility and is related to some roles and not to others. Adolescents are discriminating in their judgments of role assignments. "Ethnic factors, however, decidedly bias the judgments of adolescents in these mixed communities." Anglos are disproportionately more likely than Latins to be named to any role.—H. P. Shelley.

950. Rabinow, Irving. (Jewish Child Care Ass., NYC) **The significance of structure in a group residence program.** *J. Jewish communal Serv.*, 1962, 38(3), 297-303.—The author presents his views on the role of structure in a group residence program carried on in 6 residential units for adolescents. He emphasizes the importance of giving proper consideration to the unique needs of the young person and the significance of the various elements structured into the on-going program and philosophy of the treatment environment.—M. A. Seidenfeld.

951. Shapir, Avraham. (Mental Health Clinic, Ramat Hen) **Tipul nafshi begil hahitbagrut.** [Mental treatment in adolescence.] *Dap. refuim*, 1962, 21, 53-57.—Following Anna Freud's views on adolescence as "destruction of past identifications and creation of new, mature ones." 2 cases of adolescents with psychopathological syndroms are presented to show how they can be helped in overcoming the adolescent crisis of identification. (English & French summaries)—H. Ormian.

952. Shilo, Ilan. (Hadassah Medical Organization, Jerusalem) **Seker al hathalat havevet ben benot batey hasefer birushalayim.** [Survey on the age of menarche in school pupils in Jerusalem.] *Harefuah*, 1960, 59, 305-307.—In 1958-59 the average age of 13.9 was found as the age of menarche by inquiry of 2832 girls in the 7th-10th grades. Girls of occidental origin had a significantly earlier onset of menstruation (13.5) than those of oriental origin (14.0), whereas girls of Israel-born fathers are between these 2 groups (13.8). The menarche of girls from lower income classes appears at age 14.2, whereas in those from higher income classes, it appears at age 13.8½. Additional studies are suggested. (English & French summaries)—H. Ormian.

953. Straus, Murray A. (U. Minnesota) **Conjugal power structure and adolescent personality.** *Marriage fam. Liv.*, 1962, 24, 17-25.—The theory was submitted that "variations in conjugal power structure are functionally interrelated with the personality of the adolescent participating in the family system." Hypotheses drawn from this theory were tested with data representing the nonfarm 11th- and 12th-grade male population of a Wisconsin county. Findings and discrepancies from theory were discussed in detail.—L. Shatin.

954. Van Krevelen, Alice. (Grinnell Coll.) **Characteristics which "identify" the adolescent to his peers.** *J. soc. Psychol.*, 1962, 56, 285-289.—65 adolescent girls in a summer camp were asked to write down 5 characteristics which would best describe a camping friend to a person who did not know the friend. The Ss were asked not to use age or physical characteristics such as hair and eye color. The campers had been living with each other for 7 weeks at the time the study was done. It was assumed that the personality traits used most often in the descriptions would throw some light on the characteristics considered important by adolescents in evaluating one another. The results showed differences among the 13-, 14-, and 15-year-olds in the frequency with which they used various characteristics in their descriptions. For the group as a whole, the characteristics which were most often used in the descriptions of other campers could be subsumed under such categories as good natured, peppy, full of fun, and cheerful. Other categories most often used were consideration for others, sense of humor, and friendliness.—Author abstract.

955. Webb, Allen Paul. (U. Southern California) **Sex-role preferences of early adolescents in relation to adjustment.** *Dissert. Abstr.*, 1961, 21(12), 3859-3860.—Abstract.

956. Zohar, Ezra, & Rieher, Ezra. (Tel Hashomer Governmental Hosp.) **Gil hofaat havevet baedot hayehudiyot beyisrael.** [The age of menarche in different Jewish communities in Israel.] *Harefuah*, 1960, 59, 303-305.—The age of menarche was determined by interviewing 1000 healthy young women at the beginning of their military service (average age 18). The overall mean was found to be 13.287 (± 0.43) years. No significant differences were found between ethnic groups or between girls born in Israel and abroad. Evidently, ethnic and climatic factors do not influence the age of menarche. (English & French summaries)—H. Ormian.

MATURITY & OLD AGE

957. Axelrod, S., & Eisdorfer, C. **Senescence and figural after-effects in two modalities.** *J. genet. Psychol.*, 1962, 100, 85-91.—Visual and kinesthetic aftereffects were measured at 0, 20, 40, 60, 90, and 120 sec. after 60-sec. inspection periods in senescent and young adult men (total N = 65). No significant differences between 2 groups were obtained. Intermodality correlations were uniformly negative and mostly nonsignificant. The results were interpreted as failing to support the assumptions that (a) susceptibility to aftereffects is a direct correlate of the efficiency of CNS functioning, and (b) there is a general personality or physiological basis for susceptibility to aftereffects across modalities.—Author abstract.

958. Birren, James E., Riegel, Klaus F., & Morrison, Donald F. (National Inst. Mental Health) **Age differences in response speed as a function of controlled variations of stimulus conditions: Evidence of a general speed factor.** *Gerontologia*, 1962, 6(1), 1-18.—30 young and 20 elderly Ss were compared in a standardized experimental context which systematically varied the complexity of stimuli while keeping the response form constant. The Ss task was to respond serially to 1 of 10 signal lights by pressing 1 of 10 buttons. A total of 22 experi-

mental conditions were used ranging from simple movement and reaction times through numbers, letters, colors, symbols, and word relationships of a pre-determined nature. Under all experimental conditions the elderly Ss were slower than the young. The largest age differences in speed appeared for the superordinate, coordinate, and part word relations and for the color and color symbol associations. The smallest differences were found for choice reaction time and adjective word relations. Age differences in speed of response were not limited to the simple motor aspects of tasks but extensively involved the verbal process. Older Ss "tend to show a characteristic slower speed response, whereas young adult subjects are more task-specific in their response speed." (15) —L. Shatin.

959. Blenker, Margaret. Control groups and the "placebo effect" in evaluative research. *Soc. Wk.*, 1962, 7(1), 52-58.—2 designs developed for research with aging populations are described and the placebo effect is discussed.—G. Elias.

960. Conrad, Frederick A. (U. Arizona) Sex roles as factors in longevity. *Sociol. soc. Res.*, 1962, 46(2), 195-202.—Sex differences in longevity and recent increases in such differences have been attributed to constitutional differences. This hypothesis needs further testing against other factors in the sociocultural environment. The purpose of this study was to indicate the relation of sex roles to sex mortality differentials and the need of exploring the sociological and psychological aspects of the problem.—C. W. Page.

961. Cowen, Emory L., Reimanis, Gunars; Davol, Stephen H., & Stiller, Alfred. (U. Rochester) The social desirability of trait descriptive terms: Two geriatric samples. *J. soc. Psychol.*, 1962, 56, 217-225.—Social desirability (S-D) ratings for 118 trait descriptive adjectives were obtained from an institutional and a community geriatric sample each consisting of 40 white male Ss ranging from about 60-80 years of age. S-D perceptions of these groups were compared to each other and to those of (a) younger medical control patients, (b) a relatively "intact" schizophrenic group, and (c) college males. Both older groups were found to rate positive and negative adjectives significantly more favorably than did any of the other reference groups. This response tendency, which was interpreted as reflecting a denying, whistling-in-the-dark type of adaptation, was more extreme in the case of the domiciliated group. The geriatric samples were also more variable in their rating behaviors than the other groups. Despite the communalities between the 2 geriatric samples in comparison to the other normative groups, the data suggested that the S-D perceptions of the community oldersters were closer to the mainstream of the population-at-large.—Author abstract.

962. de Ropp, Robert S. Man against aging. New York: Grove, 1962. 305 p. \$.75 (paper).—A paperback edition of the 1960 edition.—E. Y. Beeman.

963. Fletcher, H. J., & Mowbray, J. B. (U. Wisconsin) Note on learning in an aged monkey. *Psychol. Rep.*, 1962, 10(1), 11-13.—Performance of a 34-yr.-old rhesus monkey on 10 simple object discrimination problems was inferior to that of 2 equally naive but younger controls.—B. J. House.

964. Glasser, Paul H., & Glasser, Lois N. Role reversal and conflict between aged parents and their children. *Marriage fam. Liv.*, 1962, 24, 46-51.—The personal problems of Jewish clients who requested aid from a metropolitan social agency were explored from the standpoint of the economic dependency of the aged parent upon the child.—L. Shatin.

965. Gruen, Arno. (Maimonides Hosp., Brooklyn, N. Y.) Psychologic aging as a pre-existing factor in strokes. *J. nerv. ment. Dis.*, 1962, 134(2), 109-116.—"Comparison of a stroke group with an older, non-stroke group on tests of rigidity, affective coarctation, somatic pre-occupation, drive, logical thinking and so on indicated that psychologic factors associated with old age were also characteristic of the behavior of the stroke group. Since these features in the stroke group were not directly related to differences in degree of sensory and motor impairment, we believe that a psychologic "aging" process predates the actual stroke occurrence, and may be an early manifestation of cerebral vascular disease."—N. H. Pronko.

966. Hulicka, I. M. (VA Hosp., Buffalo, N. Y.) Verbal WAIS scores of elderly patients. *Psychol. Rep.*, 1962, 10(1), 250.—Analysis of variance of subtest scores for 4 intelligence levels of 60 elderly males divided on the basis of total scale score (verbal) of the WAIS showed significant test differences and interaction between level and test.—B. J. House.

967. Kogan, Nathan, & Shelton, Florence C. (Educational Testing Service) Beliefs about "old people": A comparative study of older and younger samples. *J. genet. Psychol.*, 1962, 100, 93-111.—The present study inquired into the differences and similarities between older and younger Ss in beliefs about old people. The older (46 males and 55 females) and younger (44 males and 49 females) Ss were highly comparable in education and intelligence. A sentence completion instrument was used to assess the beliefs. The instrument consisted of 20 items, each referring to a different aspect of old people's lives or tapping the Ss' personal experiences with old people. Categories were derived from Ss' responses to the items. The responses were scored by 2 independent judges with high interjudge reliability. The statistical significance of age differences for each item was tested by chi square. Where significance was obtained, individual scoring categories within items were compared across age samples by means of critical ratios. A total of 6 items yielded significant age differences for both males and females. 2 items achieved statistical significance for males only, and 3 items for females only. For 9 items, no significant age differences were observed. Examination of the items significant for both sexes revealed a considerable degree of similarity in the beliefs held by younger and older Ss about old people. It was further noted that the belief systems had become stabilized in a manner suggestive of majority-minority group conflict. Implications of the findings were considered, with particular reference to the problem of changing beliefs about old people.—Author abstract.

968. Kogan, Nathan, & Shelton, Florence C. (Educational Testing Service) Images of "old people" and "people in general" in an older sample. *J. genet. Psychol.*, 1962, 100, 3-21.—A sentence

completion procedure was employed to determine whether differences in the image of "old people" and "people in general" observed in younger Ss would also be found among older people themselves. The sample was comprised of 109 women and 89 men, ranging in age from 49 to 92 years, noninstitutionalized and of apparently good health. An "experimental" sentence completion form containing 20 stems referring to "old people" was administered individually to approximately $\frac{1}{2}$ of the Ss. The remaining $\frac{1}{2}$ received the "control" form, which referred to "people in general," but was otherwise identical in content. Code categories relevant to each item pair were derived, and a set of independent judges scored the material with a high degree of agreement. Significant differences were obtained for 17 of the 20 item pairs. Results for each item pair were discussed in detail, and underlying themes cutting across particular item pairs were considered.—*Author abstract.*

969. Levinson, Boris M. (Yeshiva U.) Jewish subculture and WAIS performance among Jewish aged. *J. genet. Psychol.*, 1962, 100, 55-68.—A study of aged Jews indicated that their average Full Scale WAIS IQ was 96.04. The men had higher IQs than the women. The native born men had higher IQs than the foreign born women. The hierarchy of IQs followed the occupational level. At almost all occupational and educational levels, as well as age levels studied, the Verbal IQ was higher than the Performance IQ. When 50 pairs of IQs of aged men and women were matched, it was found that women had a different constellation of WAIS subtests than men. These did not follow normative standards.—*Author abstract.*

970. Lynn, R. (Exeter U., England) Aging and expressive movements: An interpretation of aging in terms of Eysenck's construct of psychoticism. *J. genet. Psychol.*, 1962, 100, 77-84.—The theory is proposed that aging can be regarded in terms of Eysenck's personality theory as entailing a shift along the psychoticism dimension towards psychoticism. From this theory it can be predicted that (a) there should be a progressively higher incidence of older people suffering psychotic breakdown—this is so, (b) tests differentiating psychotics from normals should differentiate old people from young—this is so with tests of speed, fluency, reversible perspective, vigilance, time judgments, and perceptual efficiency, (c) since expressive movements differentiate psychotics from normals they should differentiate young people from old. 2 tests of expressive movements were given to groups of old and young people. One test differentiated the groups at the $P < .01$ level; the other showed a nonsignificant trend in the predicted direction. It was proposed that psychoticism can be interpreted either as a function of insensitivity to stimuli, or as a function of high levels of inhibition.—*Author abstract.*

971. Maddox, George, & Eisdorfer, Carl. Some correlates of activity and morale among the elderly. *Soc. Forces*, 1962, 40(3), 254-260.—Limited support is afforded the frequently-found hypothesis that activity tends to decrease with age. Such a formulation "tends to obscure important antecedent and intervening variables such as socioeconomic status and self-assessments of one's ability to be active." Also partially supported is the view which

perceives a positive relationship between activity and morale. Inventory scores of 250 members of a volunteer panel participating in a longitudinal study of human aging are discussed.—*A. R. Howard.*

973. Maxwell, A. E., (Maudsley Hosp., London) Trends in cognitive ability in the older age ranges. *J. abnorm. soc. Psychol.*, 1961, 63(2), 449-452.—A factor analysis of previously presented WAIS data (Doppelt & Wallace, 1955) isolated 3 factors descriptive of groups ranging in age between 60-75 and over. As age increased, general reasoning decreased, but verbal comprehensions remained high; capacity for psychomotor coordination decreased, and ability for conceptual reasoning remained fairly well intact, though power of inductive reasoning decreased.—*G. Frank.*

974. Meyers, Marvin Daniel. (New York U.) A longitudinal analysis of the factors related to adjustment in retirement. *Dissert. Abstr.*, 1961, 21(11), 3541.—*Abstract.*

975. Pelz, K., Pike, F., & Ames, L. B. A proposed battery of childhood tests for discriminating between different levels of intactness of function in elderly subjects. *J. genet. Psychol.*, 1962, 100, 23-40.—This study reports an attempt to determine level of intactness of personality and performance in a group of elderly Ss on the basis of their performance on a battery of psychological tests used customarily at the preschool and early school levels. The hypothesis is offered, and apparently confirmed, that in spite of seeming intactness of function (good vocabulary, reasonably good memory, apparent social adequacy), many elderly individuals are functioning, at least in some respects, at what amounts to a preschool level. The Ss for the present study were 60 guests at the Masonic Home in Wallingford, Connecticut, divided on the basis of their Rorschach responses into groups of 7 "normal," 24 "intact presenile," 16 "medium presenile," and 13 "deteriorated" Ss. These Ss were given a battery of preschool tests which included the Gesell cubes, Gesell copy forms, Gesell Incomplete Man test, Monroe Visual I and III, The Lowenfeld Mosaic Test, and the verbal battery of the WISC. These tests, except for the WISC, did yield differential diagnoses among the several groups as follows: The intact presenile Ss were distinguished from normal Ss in that they failed Visual III and did not make objects on the Mosaic. The medium presenile Ss failed the steps, responded to the Mosaic at only a 4-year-old level, and added neither eyes nor feet to the Incomplete Man. The deteriorated Ss failed bridge, gate, and steps; failed diamond and rectangle; failed Visual I; and added only 3 parts to the Incomplete Man.—*Author abstract.*

976. Saul, Shura; Segal, Arthur, & Saul, Sidney R. (Jewish Guild for the Blind, NYC) The use of the small group in orienting new residents to a home for the aged: The admissions group. *J. Jewish communal Serv.*, 1962, 33(3), 256-263.—A discussion of the role played by the admissions group in aiding newly admitted residents of the Home for the Aged Blind People in Yonkers, New

York, to adapt themselves to communal living in a new environment.—*M. A. Seidenfeld.*

977. Schludermann, E., & Zubek, J. P. Effect of age on pain sensitivity. *Percept. mot. Skills*, 1962, 14, 295-301.—A dolorimeter was used to measure the pain sensitivity of 171 male Ss ranging in age from 12 to 83 yr. Measurements were taken on forehead, upper arm, forearm, thigh, and leg. Overall pain sensitivity remained constant between the teens and the late 50's but declined thereafter. The various body areas differed in the rate of decline and the age at which decline began. The pain threshold of a higher socioeconomic group (college group) was found to be much higher than that of the corresponding age section of the main experimental group.—*W. H. Guertin.*

978. Talland, George A. (Massachusetts General Hosp., Boston) The effect of age on speed of simple manual skill. *J. genet. Psychol.*, 1962, 100, 69-76.—The effects of aging were tested by speed of performance in 2 motor tasks. 3 age groups were sampled: men in their early 20s, between 40 and 63, and between 77 and 89. The tasks were: (a) continuous working of a manual counter, (b) moving beads with tweezers from one receptacle to another, (c) selecting beads of one hue from a mixed stock and moving them with tweezers. These tasks were performed singly, and each of the latter 2 was also performed in combination with the 1st (which was always done by S's nondominant hand). Each single or combined operation was performed continuously for 2 or more 60-sec. periods. Rate of performance dropped significantly on each task for all age groups. The results suggest that even the simplest motor skill, involving little exertion or coordination of component operation, declines in speed with age. The rule that increases in difficulty result in larger absolute but smaller relative increases in response time did not hold true for the present study. Increasing the difficulty of the visual motor task of moving beads (by imposing on it the restriction of a selective criterion) slowed down the performance of all 3 age groups, and to much the same extent in either absolute or relative terms. Increased difficulty arising from the concurrent performance of 2 tasks reduced rate of performance to a greater extent in the older age groups than in the younger. However, this differential age effect appeared almost entirely in one of the combined tasks.—*Author abstract.*

979. Upchurch, Harley M. A tentative approach to the study of mortality differentials between educational strata in the United States. *Rural Sociol.*, 1962, 27(2), 213-217.—Census figures indicate that the advantage in life survival of college graduates decreases in old age, while the comparison is more favorable for the high school graduate. Suggested causes are given.—*H. K. Moore.*

980. Wallin, J. E. Wallace. (Lyndalia, Del.) The psychological, educational, and social problems of the aging as viewed by a mid-octogenarian. *J. genet. Psychol.*, 1962, 100, 41-46.—Facts dealing with the psychological, educational, and social problems of the aging submitted as background material at the Governor's Conference on the Aging at Smyrna, Delaware, on June 15, 1960, and at the Wilmington Council on Aging on September 19, 1960. The author stresses the need of individualization in the psychological, educational, and social ad-

justment of the aged because of the great individual differences found among them. The unfavorable public image of the oldster is in need of revision. Many deteriorative processes can be prevented, arrested, or ameliorated by proper medical treatment and by activity therapies, especially in the form of interesting, creative, remunerative work, which constitutes a "unifying, integrative, objectifying, rejuvenating force." Many of their mental and social maladjustments are socially produced and can be prevented or overcome. The writer protests against the adoption of involuntary, automatic retirement systems at an arbitrary age, and sounds a plea for the humanization of all such systems in accordance with scientific findings, and the institution of programs of retraining and updating of fit oldsters for remunerative job placement.—*Author abstract.*

SOCIAL PSYCHOLOGY

981. Boulding, Kenneth E. (U. Michigan) Conflict and defense: A general theory. New York: Harper, 1962. ix, 349 p. \$7.00.—"This is a work in abstract social theory. It purports to identify and build theoretical models of a set of social processes related to the phenomenon of conflict. Its theory is ethically neutral." The early chapters are concerned with "Static Models of Conflict"; "The Dynamics of Conflict"; "The Contribution of Game Theory"; "The Theory of Viability"; "The Individual as a Party to Conflict"; "The Group as a Party to Conflict"; "The Organization as a Party to Conflict"; and "Conflict between the Individual, the Group, and the Organization." Later chapters apply this theory to economic, industrial, international, and ideological conflicts. The author concludes with "Conflict Resolution and Control" and "Epilogue: The Present Crisis of Conflict and Defense."—*C. J. Adkins.*

982. Braun, J. R., & Haven, G. A., Jr. Weber fraction analogues in social perception: Further investigation. *Percept. mot. Skills*, 1962, 14, 282.—3 groups (Abstract, Agreement, Disagreement) indicated what they felt would be a "real" difference in magnitude between majority and minority groups of varying sizes. For each of the 3 groups Delta M/M was not invariant over different values of M ($p=.001$). The findings are consistent with those of Levy but the authors interpret them as failing to support the existence of a Weber Fraction Analogue in social perception.—*W. H. Guertin.*

983. Camilleri, Santo F. (Stanford U.) Theory, probability, and induction in social research. *Amer. sociol. Rev.*, 1962, 27(2), 170-178.—"The primary function of the scientist is to develop verified systematic theory. Probability considerations enter into the research process in three basic ways: intrinsically, as postulates in the theory; in auxiliary manner, as a part of the process of observation, including the explanation of errors of observation; and inductively, as a part of the logical structure of verification. The practices of sampling from finite populations, as in survey research, and of randomized experimentation are auxiliary uses of probability. The scope of induction provided in each by the method of sampling is inadequate for scientific purposes. To extend that scope requires the formulation and verification of theory. Statistical inference is

inadequate as an inductive policy for logical and pragmatic reasons. The objective of systematic theory suggests the criterion of systematic import as part of a more adequate inductive policy."—*L. Berkowitz*.

984. **Desmonde, William H.** *Magic, myth, and money: The origin of money in religious ritual.* New York: Free Press Glencoe, 1962. xx, 208 p. \$5.00.—This text explores the original symbolisms associated with money. The author indicates that "money did not, as economists have taught, originate as a medium of exchange, for it was first used in societies where the market institution barely existed and the exchange of economic goods was largely confined to the redistributive economy of the household. The meaning of money was to be found in the emotions and values associated with the family. By relating money to the ritual of the sacred family meal, the bull ritual, and many other ancient symbolisms, the author offers a provocative interpretation that employs anthropological data and the insights of psychoanalysis and sociology to explain the origins of what continues to be one of man's potent symbols."—*N. De Palma*.

985. **Hochheimer, Wolfgang.** *Probleme einer politischen Psychologie.* [Problems in political psychology.] *Psyche, Stuttgart*, 1962, 16(1), 1-33.—A psychology of political life is important for the additional understanding it gives to publically understated features of human beings. It is particularly necessary in view of the way in which human possibilities are masked and misrepresented by ideologies that place particular emphasis on the intellect, narrowly conceived. The Nazi movement in a depth psychological perspective is presented as an example of what a psychology of politics has to offer.—*E. W. Eng*.

986. **Richards, James McDowell, Jr.** (U. Utah) *A test of the cue additivity principle in a restricted social interaction situation through use of a mathematical learning theory.* *Dissert. Abstr.*, 1961, 21(10), 3183-3184.—*Abstract*.

987. **Rose, Arnold M. (Ed.)** (U. Minnesota) *Human behavior and social processes: An interactionist approach.* Boston, Mass.: Houghton Mifflin, 1962. xv, 680 p. \$7.50.—Commencing with a summary of symbolic interaction theory, 35 different writers examine facets, nuances, and implications demonstrating the utility of the theory to provide testable hypotheses of the relationship of self and society. From this common theoretical viewpoint a number of diverse models for research are provided, as well as results of empirical investigations. Inadequacies and gaps in the theory are recognized both implicitly and explicitly.—*C. W. Page*.

988. **Spaulding, Irving A.** (U. Rhode Island) *Social system concepts as successive approximations.* *Sociol. soc. Res.*, 1962, 46(2), 176-180.—5 social system concepts that have appeared in the literature of sociology and anthropology are given critical scrutiny as successive approximations. Regarded as a construct of symbols, each is evaluated with respect to specific premises and criteria of adequacy. The development of approximations is reflected in the evaluation.—*C. W. Page*.

989. **Swanson, G. E.** (U. Michigan) *Mead and Freud: Their relevance for social psychology.* *Sociometry*, 1961, 24(4), 319-339.—"Mead's work is generally considered fundamental but without fruitful implications for research; Freud's as provocative but wrong." Mead's theories are barren of problems for investigation, his most relevant premises are untestable, and the testable aspects are not social-psychologically relevant. When instinct and Lamarck are taken out of Freud, 2 useful ideas remain. One has to do with "the source of conditions that precede, accompany, and follow the presence of mind and provide limits to gratification." The other concerns "features of instrumental relations of mind."—*H. P. Shelley*.

990. **Williams, Thomas Rhys.** (Sacramento State Coll.) *A critique of some assumptions of social survey research.* *Publ. Opin. Quart.*, 1959, 23(1), 55-62.—"Social scientists who utilize the questionnaire survey technique would further their scientific aims if they would critically examine the assumptions which underlie and shape the character of their research." In particular, note is taken of: "(1) the assumption of the validity of a survey response as a social datum, and (2) the assumption of dynamic equivalence among survey responses, or between such responses and actual social behavior."—*E. P. Hollander*.

CULTURE & CULTURAL RELATIONS

991. **Bronfenbrenner, Urie.** (Cornell U.) *Personality and participation: The case of the vanishing variables.* *J. soc. Issues*, 1960, 16(4), 54-63.—A discussion of the findings of the Springdale project with respect to the complex and elusive part played by personality characteristics in community participation. The tendency toward acquiescence, besides being a complicating factor in measuring other variables, showed a significant negative correlation with community participation. Social class and "rosiness of outlook" correlated positively with participation.—*E. Y. Beeman*.

992. **Brown, Morgan C.** (Southern U.) *Selected characteristics of southern rural Negroes exchanged to a southern urban center.* *Rural Sociol.*, 1962, 27, 64-70.—The Negroes residing in United States cities numbered 750,000 in 1870, 2 million in 1900, 4 million in 1930, 12 million in 1957. Of the 312 male adult Negroes who moved to Baton Rouge, Louisiana, most of them came from within 50 miles, were better educated than those who did not move, and were usually laborers.—*H. K. Moore*.

993. **Devereux, Edward C., Jr.** (Cornell U.) *Community participation and leadership.* *J. soc. Issues*, 1960, 16(4), 29-45.—A review of the "findings with respect to the correlates of different levels and types of community participation" in Springdale, a small community in south central New York State.—*E. Y. Beeman*.

994. **Devereux, Edward C., Jr.** (Cornell U.) *Neighborhood and community participation.* *J. soc. Issues*, 1960, 16(4), 64-84.—A discussion of the social ecology of Springdale, the differentiation of the rural sections into "neighborhoods," how these differ from one another, and "how they are related to one another and to the central community." Some of the

findings of the Springdale project with respect to ecological analysis are presented.—*E. Y. Beeman.*

995. Devereux, Edward C., Jr. (Cornell U.) **Springdale and its people.** *J. soc. Issues*, 1960, 16(4), 7-15.—A description of Springdale (a small community in south central New York State), its history, and the dynamics of its present status.—*E. Y. Beeman.*

996. Devereux, Edward C., Jr., Bronfenbrenner, Urie, & Harding, John. (Cornell U.) **Community participation as a research problem.** *J. soc. Issues*, 1960, 16(4), 1-6.—A description of the Springdale project, an interdisciplinary research project "carried on since 1950 by a team of staff members of Cornell University's Department of Child Development and Family relationships," the article serves as an introduction to this issue of the journal which presents some of the findings of the project. (16 ref.)—*E. Y. Beeman.*

997. Fernández-Marín, Ramón. **The Puerto Rican syndrome: Its dynamics and cultural determinants.** *Psychiatry*, 1961, 24(1), 79-82.—The hyperkinetic episodes of the Puerto Rican syndrome, identified as hysterical attacks, function as basic ego defenses against psychotic breaks and regressions and originate in the heteroclitic dependency of Puerto Rican infants.—*C. T. Bever.*

998. Fischer, H., & Trier, J. P. **Das Verhältnis zwischen Deutschschweizer und Westschweizer: Eine sozialpsychologische Untersuchung.** [Differences between German- and French-speaking Swiss: A social-psychological investigation.] Bern, Switzerland: Hans Huber, 1962. 82 p. DM 11.50.—A Kent-Rosanoff-like list was administered to a total of 1500 German-speaking and French-speaking students at 5 Swiss universities to determine differences in autostereotypes within and between the 2 language groups. A factorial analysis of the data yielded 3 principal components labeled evaluation, strength, and activity. Cultural and historical influences are discussed. Tables and figures are included.—*K. J. Hartman.*

999. Goodchilds, Jacqueline D., & Harding, John. (Matrix Corp., Los Angeles) **A case study of community participation.** *J. soc. Issues*, 1960, 16(4), 46-53.—A discussion of a community project to raise money to repair a dam in the village.—*E. Y. Beeman.*

1000. Goodchilds, Jacqueline D., & Harding, John. (Matrix Corp., Los Angeles) **Formal organizations and informal activities.** *J. soc. Issues*, 1960, 16(4), 16-28.—An analysis of the formal organizations (government and welfare, service and sociability, lodges, cultural and recreational, and church) and the informal leisure time activities of Springdale, a small community in south central New York State.—*E. Y. Beeman.*

1001. Gorer, Geoffrey, & Rickman, John. **The people of Great Russia.** New York: Norton, 1962. xli, 235 p. \$1.65 (paper).—First published in 1949 by Cresset Press, this book is now out in a paperback edition with a new introduction by Gorer. Included are "Ten Sketches of Russian Peasant Life (1916-1918)" by Rickman and a discussion of the childhood training, character development, and psychology of the Russian people by Gorer.—*E. Y. Beeman.*

1002. Janov, Arthur. (Claremont Graduate School) **A study of the polarities of Jewish identification.** *Dissert. Abstr.*, 1961, 21(10), 3182.—*Abstract.*

1003. Katz, Elihu, & Zloczower, Awraham. (U. Chicago) **Ethnic continuity in an Israeli town: I. Relations with parents.** *Hum. Relat.*, 1961, 14(4), 293-308.—The responses of 2nd-generation Yemenites and Ashkenazim (age 24 years) are compared for indications of intergenerational continuity. This continuity is reflected in greater acceptance of parental authority and in the affirmation of traditional values and attitudes. The evidence supports greater continuity among the Yemenites, although in both groups changes are taking place which seem gradual and selective rather than rebellious and total. Yemenite group culture in this particular structure is suggested as an explanatory factor.—*W. W. Meissner.*

1004. Katz, Elihu, & Zloczower, Awraham. (U. Chicago) **Ethnic continuity in an Israeli town: II. Relations with peers.** *Hum. Relat.*, 1961, 14(4), 309-327.—(See 37: 1003) The prior study of intergenerational continuity between 24-year-old Yemenites and Ashkenazim is extended here to intragenerational relations. Results based on the responses of 90 Ss from both ethnic groups indicate that friendships tend to be homogeneous as to age, sex, and ethnic group. Differences between the groups were found in the importance attributed to friendship, in the extent and cohesiveness of friendships, and in the sociometric structure of relations with age-peers. The most elaborate friendship patterns are found in Ashkenazi men and the least elaborate in Yemenite women. In general, friendship is more important for the Ashkenazim.—*W. W. Meissner.*

1005. Kluckhohn, Clyde. **Culture and behavior.** New York: Free Press Glencoe, 1962. viii, 402 p. \$6.75. The author's collected essays (21 in number) are edited by Richard Kluckhohn. They concern the following subjects: theory of culture, archaeological dating, Navaho ethnology, Navaho personality, Russian character, socialization, Indian-white relations in the United States, theory and sociology of values, and education.—*L. M. Hanks, Jr.*

1006. Lantis, Margaret. **Eskimo childhood and interpersonal relationships: Nunivak biographies and genealogies.** Seattle, Wash.: Univer. Washington Press, 1960. xv, 215 p. \$4.75.—Biographies of 18 Alaskan Eskimos, usually in their own words, are recorded together with explanatory notes. Also included are sequels to the life histories from a subsequent visit, an ethnographic conclusion, Rorschach summaries, and genealogies.—*L. M. Hanks, Jr.*

1007. Lee, Frank F. (Adelphi Coll.) **Negro and white in Connecticut Town.** New York: Bookman, 1961. 207 p. \$5.00.—A report of a "field study of Negro-white relations in a small New England town." This study had two objectives. The first . . . was to determine the 'place' of the Negro in the community." The 2nd objective "aimed to ascertain the means of controlling and perpetuating the race relations pattern. We wished to find out what processes of social control operate to keep Negroes 'in their place.'" The findings indicated that "in such a town as this one, social control in race relations tends to be unofficial, informal, situational,

subtle, and indirect." Biographical data is provided for both Negro and white informants. (182-item bibliography).—*C. J. Adkins.*

1008. Maccoby, E. E. (Stanford U.) **The choice of variables in the study of socialization.** *Sociometry*, 1961, 24, 357-371.—Variables coming from laboratory studies of learning, from psychoanalytic theories, and from the sociological literature on socialization are examined to show "the way in which different theoretical systems, and different social-science disciplines, have converged to define and elaborate some of the variables which have been used in studies of socialization. In some cases this convergence has produced confusion over the meaning of variables. More importantly, it has produced a startling range of findings which have not yet been integrated into a theory of socialization."—*H. P. Shelley.*

1009. Martin, D. A. **The denomination.** *Brit. J. Sociol.*, 1962, 13, 1-14.—As a social phenomenon, the denomination is peculiarly characteristic of the United States and the British Commonwealth; and some of the differentiae of those societies, their liberalism, individualism, pragmatism, and disunity within consensus, are at least related to the specific differentiae of denominationalism. The denomination flourishes in conditions and in countries where social change proceeds at a steady pace according to agreed criteria.—*R. M. Frumkin.*

1010. Nadad, Avraham, & Ahiham, Efraim. **Hanikhey aliyat hanoar bahayim atsmayim.** [Students of youth immigration in their independent life.] Jerusalem, Israel: Jewish Agency for Israel, Youth Immigration Department, 1962. 117 p.—A survey carried out in 1955-56 in order to follow up the 45,000 students of the Youth Immigration Department during the 20-year period from February 1934 until the end of 1953. The following topics are described and analyzed: pupils of the Youth Immigration Department in the past, their occupations today, satisfaction with work, dwelling conditions, level of knowledge of Hebrew, and survivors of Nazi disaster.—*H. Ormian.*

1011. Sanua, V. D. (Yeshiva U.) **Differences in personality adjustment among different generations of American Jews and non-Jews.** In M. K. Opler (Ed.), *Culture and mental health* (see 34: 7593). Pp. 443-466.—The Rorschach Multiple Choice Test and an adaptation of the Thurstone Personality Schedule were administered to Jewish and non-Jewish high school students. The 3rd-generation Jewish group gave the healthiest mean score on the objective test, and the poorest mean score on the Rorschach. Their identification with their minority group was the weakest. Socioeconomic status and synagogue affiliation (Reform, Conservative, Orthodox) did not affect the test results. It was hypothesized that conflict and stresses arising from weaker identification with the minority group would be strongest with the 3rd generation. The 3rd-generation student, being the most "acculturated," seemed to "know" the right answers on the objective test, while there was evidence of anxiety on the projective test.—*Author abstract.*

1012. Sanua, V. D. (Yeshiva U.) **Sociocultural factors in responses to stressful life situations: The behavior of aged amputees as an**

example. *J. Hlth. hum. Behav.*, 1960, 1, 17-24.—This study was designed to test the hypothesis that there are sociocultural components in patients' reactions to stress situations and disabilities. Elderly male amputees comprising Jews, Catholics, Protestant, and Negroes of low socioeconomic status were interviewed in 5 New York hospitals where they were undergoing rehabilitation. Among other findings, the study showed that the Jewish patient tends to mourn the loss of his limb much longer than the other patients, presents more somatic complaints, and has a pessimistic outlook in his rehabilitation.—*Author's abstract.*

1013. Smit, Claude M. (U. Pretoria, South Africa) **Comparative analysis of results from Kraus-Weber Test of minimum muscular fitness in South African children.** *J. soc. Res., Pretoria*, 1961, 12(1), 1-20.—"The Kraus-Weber Test was applied to 2,130 white and 496 Bantu scholars between the ages of 6 through 16 years and the results compared with those obtained by Kraus and Hirschland. Both groups were found to be superior to the American children but inferior to Austrian, Italian and Swiss children." The difference between American and European groups is ascribed to the difference between physical education programs and the highly mechanized labor-saving devices in the United States. (Dutch & English summaries)—*N. De Palma.*

1014. Straus, M. A. (U. Minnesota) **Deferred gratification, social class, and the achievement syndrome.** *Amer. sociol. Rev.*, 1962, 27(3), 326-335.—"The theoretical and research literature on self-imposed postponement of gratifications or satisfactions is reviewed with emphasis on the relation of such a 'Deferred Gratification Pattern' (DGP) to social class and social mobility. Three hypotheses growing out of this review were tested on 338 male high school students. The hypothesis of a deferred gratification pattern received some support from the fact that scales with reproducibilities from .92 to .96 were developed for deferment of five adolescent needs: affiliation, aggression, consumption, economic independence and sex; and by the intercorrelation of these scales. The hypothesis of positive correlation between the DGP scales and socioeconomic status was not supported. The hypothesis of positive correlation between the DGP scales and achievement role-performance and role-orientation was supported. These relationships were not eliminated by controls for socioeconomic status and intelligence. Findings are interpreted as supporting the theory that need deferment is functional for social mobility in American society."—*L. Berkowitz.*

1015. Sumotirto, B. W. (Gadjah Mada U., Jogjakarta) **Social attitudes among high school students in Indonesia.** *Brit. J. educ. Psychol.*, 1962, 32(1), 3-11.—512 high school students in various Indonesian towns gave choices of actions in 15 situations. They also indicated what would be realistic to expect. Responsibility towards society or country ranked high but differences existed between "normative" and "realistic" levels. 4 social types were identified.—*B. T. Jensen.*

1016. Taft, R. (U. Western Australia) **Adjustment and assimilation of immigrants: A problem in social psychology.** *Psychol. Rep.*, 1962, 10(1), 90.—A discussion of methods for studying the role

of psychological variables in assimilation of immigrants and a brief description of results of previous studies of immigrants to Western Australia—*B. J. House*.

1017. Taft, Ronald. (U. Western Australia) **The assimilation of Dutch male immigrants in a Western Australian community.** *Hum. Relat.*, 1961, 14(3), 265-281.—Richardson's study of the assimilation of British immigrants was replicated with Dutch immigrants. Richardson's conclusions—(a) that assimilation can be divided into satisfaction with life in Australia, identification with Australia, and acculturation and (b) that a certain amount of satisfaction is needed for identification to occur, and both are needed for a high level of acculturation—are supported by the findings on the Dutch Ss.—*W. W. Meissner*.

1018. Weinstein, Edwin A. **Cultural aspects of delusion: A psychiatric study of the Virgin Islands.** New York: Free Press Glencoe, 1962. 215 p. \$5.00.—A demonstration (by reference to 5 sub-cultures in the Virgin Islands) that delusions are condensed and caricatured forms of social language with meaning to the patient in relation to, and as a result of, his culture. Implications of such an orientation for treatment are noted. Using psychiatric and anthropological concepts the Sapir-Whorf interaction hypothesis is illustrated as economical for a variety of research purposes of this nature.—*C. W. Page*.

1019. Willcox, W. B. (U. Michigan) **An historian looks at social change.** *J. soc. Issues*, 1961, 17(1), 50-65.—A discussion of the historical approach to analyses of social change, this discussion points up the difficulties of describing social change adequately because of the relative multiplicity of probable causative factors that impinge upon a given historical event.—*A. Barclay*.

1020. Yoshida, Masaaki; Moriyama, Minako, & Tamai, Chizuko. **Structure of authority in the Japanese mind.** *Jap. J. Psychol.*, 1962, 32, 353-366.—Various social positions were rated on their attributes, such as social status, and the resultant rankings appear to coincide with the current social hierarchy. The intercorrelations of the attributes were factored and the resulting factors are discussed.—*A. Barclay*.

1021. Zajonc, Robert B., & Wahi, N. Kishor. (U. Michigan) **Conformity and need-achievement under cross-cultural norm conflict.** *Hum. Relat.*, 1961, 14(3), 241-250.—The relation between conformity and achievement was studied in 30 male Indian students. The results indicate that the relation is mediated by the instrumental value of conformity, and that when conformity is so perceived, a positive rather than a negative relation will be obtained. The high-achievement group was more sensitive to the instrumental value of conformity than to the congruence of the norms; the opposite was found in the low-achievement group. The groups did not differ in susceptibility to situational pressures.—*W. W. Meissner*.

SOCIAL STATUS & STRUCTURE

1022. Berger, Bennett M. (U. Illinois) **The myth of suburbia.** *J. soc. Issues*, 1961, 17(1), 38-49.—An analysis of current conceptualizations about

suburban life, as reflected in both the popular and the scientific literature, indicates that the current image of suburban life is wide of the mark and that the generality of the comments about "suburbia" is quite limited and probably does not hold for the majority of such suburban settings.—*A. Barclay*.

1023. Blalock, H. M., Jr. (Yale U.) **Occupational discrimination: Some theoretical propositions.** *Soc. Probl.*, 1962, 9(3), 240-247.—The general problem of occupational discrimination is closely related to the nature of the occupation in which discrimination is practiced. To illustrate some theoretical propositions concerning occupations in which there is relatively little discrimination the author discusses the integration of Negroes in professional baseball. Professional baseball is one of those highly competitive occupations in which individual performance is easily evaluated and in which high individual achievement is closely related to high group performance and productivity. The theoretical propositions set forth have some rather practical applications with respect to the occupational status of Negroes and other minority group members.—*R. M. Frumkin*.

1024. Campbell, Vincent Neal. (U. Colorado) **Assumed similarity perceived sociometric balance, and social influence: An attempted integration within one cognitive theory.** *Dissert. Abstr.*, 1961, 21(11), 3516.—*Abstract*.

1025. Cohen, Yehudi A. (Columbia U.) **Social structure and personality: A casebook.** New York: Holt, Rinehart & Winston, 1961. 527 p. \$7.50.—An account of the relationship between personality and social-structural arrangements of society. The focus is upon conditions in which people function and the consequences of these conditions. The conclusion is that similar social environments (e.g., systems of reward and punishment, patterns of interpersonal relations, etc.) will affect personality similarly despite differing traditional cultures. Effects of particular "personality constellations" upon social structure (as in legal, military, and economic institutions) are also discussed. About ¼ the book consists of research studies cited to document various theoretical points.—*N. G. Burton*.

1026. Dirks, Heinz. **Probleme des beruflichen Auf- und Abstiegs.** [Problems of professional ascent and descent.] *Psychol. Rdsch.*, 1962, 13(2), 117-130.—The material, social, and psychological conditions of vertical mobility within an open society are discussed.—*W. J. Koppitz*.

1027. Kadushin, Charles. (Columbia U.) **Social distance between client and professional.** *Amer. J. Sociol.*, 1962, 67, 517-531.—The effect of social distance between client and professional on the stability of their interaction is studied from reports of the former clients of ministers, physicians, and psychotherapists who are now applying to a psychiatric clinic. On 4 dimensions of social distance—normative, interactive, cultural, and personal—ministers are closest, physicians are more distant, and psychotherapists are the most distant from their clients. Stable interaction between client and professional is most likely when internalized norms, common expectations, and optimum cathexis exist among the role partners. These conditions are best met by the ministers and counselees, and least of all met by psychotherapists and patients. Social prox-

imity and distance each have advantages and disadvantages in maintaining the conditions of stable interaction.—R. M. Frumkin.

1028. Kosa, John; Rachiele, Leo D., & Schommer, Cyril O. (Cornell U.) The self-image and performance of socially mobile college students. *J. soc. Psychol.*, 1962, 56, 301-316.—Using a sample of 369 male and 182 female college students, this study attempted to separate some psychological factors in social mobility. While the "mobile" and "non-mobile" Ss, taken as total groups, did not differ significantly on the traits examined, an analysis of the sample by selected categories (sex, levels of aspiration, ethnic origin, and financial support) did yield meaningful differences. Among the mobile male students, 3 personality factors emerged: (a) an anticipatory adjustment to the desired higher class, (b) a technique for coping with special impediments, and (c) a high motivation associated with self-confidence and high achievements. In contrast, mobile female students generally manifested timidity and self-undervaluation.—*Author abstract.*

1029. Maccoby, E. E. (Stanford U.) Class differences in boys' choices of authoritative roles. *Sociometry*, 1962, 25(1), 117-119.—Included in a questionnaire administered to 245 6th-grade boys in the greater-Boston area were 6 items asking the boys to choose between 2 occupations. "We believe we have demonstrated that boys' occupational choices, in relation to their social class of origin, do not simply mean that boys from 'higher' occupational groups want 'higher' occupations in terms of the greater money and prestige that the higher-status occupations entail. Apart from these factors, the sons of upper-middle-class families seem to have acquired some interest in occupations which involve training, supervising, or controlling others.—H. P. Shelley.

1030. Rainwater, Lee. (Social Research, Inc., Chicago) Social status differences in the family relationships of German men. *Marriage fam. Liv.*, 1962, 24, 12-17.—Approximately 140 relatively unstructured interviews were conducted with men under 50 at various class status levels in West Germany, excluding Berlin. Qualitative interclass analysis and comparisons were made for the patterns of family relationship. These results were discussed in the light of familial patterns of men in the United States.—L. Shatin.

1031. Reisman, David. (Harvard U.) Styles of response to social change. *J. soc. Issues*, 1961, 17 (1), 78-92.—An analysis of the differential effects of social class in the production of social change, pointing out that the pressures of social change are experienced primarily by the middle class in an active sense and more passively by the lower classes, and that changing cultural values are reflected largely in changes in middle-class attitudes rather than being reflected in lower classes or upper classes.—A. Barclay.

1032. Ross, John A. (Albion Coll.) Social class and medical care. *J. Hlth. hum. Behav.*, 1962, 3(1), 35-40.—Data from 2 years of national health surveys (1957-59) indicate that a positive correlation is present not only between social class and frequency of medical service, but for type of service (upper class medicine is more preventive). The intermediate links

which help create these relationships are as follows: "Unequal purchasing power, differing interpretations of illness, unlike theories of illness and orientations toward treatment, and differential knowledge and use of information across the several social classes, all emerge as significant." (17-item bibliogr.)—L. A. Ostlund.

1033. Sewell, W. H. (U. Wisconsin) Social class and childhood personality. *Sociometry*, 1961, 24, 340-356.—Studies on the relationship of social class and child personality are briefly reviewed. Among the conclusions reached are: (a) at least some of the variability in child personality is related to the socioeconomic status (SES) of the child, (b) there is no evidence for greater middle-class neuroticism, and (c) despite the great attention to such disciplinary procedures as nursing, weaning, and toilet training, little or no relationship has been found with child personality. Suggestions for future research include: (a) a large scale community study using several SES indicators and personality measures; (b) intensive study of the relationship between SES and personality in a community with clear subcultures; (c) mobility, occupational orientations, age, sex, and intraclass variations should be studied in the effort to learn more about social influences upon personality.—H. P. Shelley.

1034. Thomas, R. Murray. (U. California, Santa Barbara) Reinspecting a structural position on occupational prestige. *Amer. J. Sociol.*, 1962, 67 (5), 561-565.—Rankings of occupational prestige in Indonesia, a nonindustrialized nation, are found to correlate highly with prestige rankings reported for 6 industrialized nations. These results cast doubt on the adequacy of the structuralist position offered by Inkeles and Rossi for identifying the most important determinants of job status. An alternative explanation is provided by identifying 6 dimensions of occupational prestige which interact to determine the status of particular jobs, namely: power, financial reward, crucial role, education, mental-physical, service-to-society.—R. M. Frumkin.

1035. van der Merwe, W. Stratification in a Cape colored community. *Sociol. soc. Res.*, 1962, 46(3), 302-311.—A comparative study was made of the past and present stratification patterns of a Cape Colored Community. It was found that the bases of status have shifted from ascribed racial factors to achieved factors. By means of a specific technique the spontaneous comments made by 10 raters while rating were recorded and analyzed in an effort to determine different subcultural value systems in the community. The results of this analysis, supplemented by a questionnaire administered to a representative sample of the community, suggest the advisability of a distinction between bases and correlates of status, and warn against the use of arbitrary criteria to measure status without investigating subcultural and individual values on which status may be based.—*Journal abstract.*

1036. Works, Ernest. Residence in integrated and segregated housing and improvement in self-concepts of Negroes. *Sociol. soc. Res.*, 1962, 46(3), 294-301.—An attempt was made to investigate the hypothesis that Negroes in integrated housing have more positive self-concepts than do Negroes in segregated housing. While our data did not confirm this hypothesis, it did show that Negroes in integrated

housing tend to undergo more improvement in self-concept than do Negroes in segregated housing. This suggests that an improvement in the status of the Negro is associated with an improvement in the Negro's self-concept.—*Journal abstract.*

ATTITUDES & OPINIONS

1037. American Association for Public Opinion Research. *Proceedings of the Fourteenth Annual Conference: May 14-17, 1959. Publ. Opin. Quart.*, 1959, 23(3), 407-449.—Abstracts of papers and round table discussions, and a summary of proceedings of the annual business meeting.—*E. P. Hollander.*

1038. Blood, Robert O., Jr., & Nicholson, Samuel O. The attitudes of American men and women students toward international dating. *Marriage fam. Liv.*, 1962, 24, 35-41.—This study of random samples of men and women students at the University of Michigan reveals a permissive climate of student opinion toward dating between American girls and foreign men.—*L. Shatin.*

1039. Braun, J. R. (U. Bridgeport) Three tests of the McClelland discrepancy hypothesis. *Psychol. Rep.*, 1962, 10(1), 271-274.—Nonsense syllables and pseudo-words were rated by 2 groups of 23 college students on a pleasant-unpleasant scale. For both types of material, items tended to be liked to the extent to which they resembled actual words. A 3rd group of 20 students provided evidence that familiarization training with nonsense syllables increases pleasantness rating.—*B. J. House.*

1040. Brown, L. B. (U. Adelaide) Religious belief and reports of childhood experiences. *Psychol. Rep.*, 1962, 10(1), 269-270.—"No relationship between strength of religious belief and reports of childhood experiences was found for 258 University students."—*B. J. House.*

1041. Byrne, Donn. (U. Texas) Interpersonal attraction as a function of affiliation need and attitude similarity. *Hum. Relat.*, 1961, 14(3), 283-289.—An attitude scale, dealing with 26 issues, was administered to 84 students. After 2 weeks, the same scale—supposedly filled out by another student, but in fact by E—was presented for rating on several scales. Affiliation need was also evaluated using 4 TAT cards. Results indicate (a) that a stranger with attitudes similar to the S's was rated equally positively by Ss both high and low in affiliation need and (b) that a stranger with dissimilar attitudes was rated more negatively on measures of interpersonal attraction.—*W. W. Meissner.*

1042. Carter, Richard F. (Stanford U.) Bandwagon and sandbagging effects: Some measures of dissonance reduction. *Publ. Opin. Quart.*, 1959, 23(2), 279-287.—In a study of a school bond issue election where 2 prevalent norms—citizen responsibility to vote and the expectation of low voter turnout—which offered alternative foci for resolving a conflict of attitudes and behavior, 2 distinct changes took place in the nonvoters. Persons who saw their attitude as relevant to the 1st norm "appear to have increased their attitudinal level in relation to their communicatory activity level. . . . We have called this the 'bandwagon' effect." Persons who saw their attitude as relevant to the 2nd norm "appear to have decreased their attitudinal level in relation to their

communicatory activity level. . . . We have called this the 'sandbagging' effect. Both these mechanisms reflect the individual's search for a stability in his cognitive structure . . . illustrative of Festinger's dissonance theory."—*E. P. Hollander.*

1043. Catton, William R., & Sung Chick Hong. (U. Washington) The relation of apparent minority ethnocentrism to majority antipathy. *Amer. sociol. Rev.*, 1962, 27(2), 178-191.—To determine whether "majority hostility is associated with the appearance of ethnocentrism in minorities," 557 students at the University of Washington completed a questionnaire on which they indicated (a) the apparent ethnocentrism of various minority groups, (b) the social distance they desired between themselves and each of these groups, and (c) their level of anti-Semitism. Antipathy toward the various minority groups and the apparent ethnocentrism of these groups was found to be curvilinearly related even for the nonstereotyping, non-anti-Semitic judges. A 3rd variable, "social dominance," positively correlated with social nearness, could have masked the ethnocentrism-antipathy relation. After social dominance is taken into account, "residual majority antipathy is related to apparent minority ethnocentrism in such a way as to support the conclusion that to appear ethnocentric entails measurable costs for the group in intergroup relations."—*L. Berkowitz.*

1044. Christensen, Harold T., & Carpenter, George R. Timing patterns in the development of sexual intimacy: An attitudinal report on three modern western societies. *Marriage fam. Liv.*, 1962, 24, 30-35.—Attitude toward premarital coitus by casual dates, by couples in love, and by couples in love and formally affianced was measured with a carefully constructed questionnaire. College students of 3 geographical areas were compared: United States midwestern (N=355), United States intermountain (primarily Mormon) (N=168), and Denmark (N=235). Their dating, petting, and coital patterns were reported and analyzed.—*L. Shatin.*

1045. Davis, Morris. (U. Wisconsin) Community attitudes toward fluoridation. *Publ. Opin. Quart.*, 1959, 23(4), 474-482.—"There is one recent scientific advance whose adoption has held much public attention . . . fluoridation of public water supplies . . . [on which] the public at large has been summoned in many communities to issue its sovereign Yes or No." A review of the opposition to fluoridation suggests the hypothesis that "antifluoridationism" derives from a more general attitudinal syndrome. "If publics are to decide on scientific questions, they must be able to penetrate to the merits of the cases. This they cannot do until they are at least somewhat familiar with scientific method and outlook. . . . It is folly for the publics to be allowed to decide what is to be done with scientific achievements if their decision rests on whether or not they believe in scientific method."—*E. P. Hollander.*

1046. Davis, Warren C. (Rochester Inst. Technology) Inventory of attitudes and ideals. *Personnel J.*, 1962, 41(6), 290-292.—The Inventory of Attitudes was given to 225 sophomores and juniors (100 in 1961 and 125 in 1947-49) at the Rochester Institute of Technology and to 20 faculty members in the College of General Studies. In general, the students were more conservative in their attitudes than the faculty. There were some marked changes,

in the students' attitudes including: (a) decreased belief in annual wage contracts, (b) increased interest in sending manpower to assist nations fighting to preserve democratic principles, (c) decreased interest in making grounds for divorce more difficult, (d) decreased desire to eliminate taxes on basic necessities, (e) decreased interest in declaring war by voting, (f) decreased belief that machines tend to create more jobs than they destroy, and (g) increased approval of a checkoff system for union dues.—*M. B. Mitchell.*

1047. Eddy, Elizabeth Marie. (Columbia U.) **Attitudes towards desegregation among southern students on a northern campus.** *Dissert. Abstr.*, 1961, 21(12), 3872.—*Abstract.*

1048. Esterson, Harold Herman. (New York U.) **A study of the self attitudes and attitudes towards authority of conservatives and radicals.** *Dissert. Abstr.*, 1961, 21(10), 3164-3165.—*Abstract.*

1049. Evan, William M. (Columbia U.) **Cohort analysis of survey data: A procedure for studying long-term opinion change.** *Publ. Opin. Quart.*, 1959, 23(1), 63-72.—"The purpose of this paper is, to present and illustrate . . . a method of analysis which combines the long-run perspective of the trend study with the panel-study focus on process. . . . Repeated interviews enable the panel analyst to study not only net change but 'turnover.' The trend analyst, on the other hand, is restricted to the study of net change. However, the analogue of a group of specific panel respondents in successive cross-sectional surveys is a 'cohort' . . . a group of persons born at a particular time, whether in a given year, in a five-year period, or in any other interval." By an age breakdown adjusted to the interval between a series of cross-sectional surveys, opinion changes of a cohort can be studied. A methodology for this is presented with illustrations, and limitations are discussed.—*E. P. Hollander.*

1050. Fishbein, Martin, & Raven, Bertram H. (U. Illinois) **The AB scales: An operational definition of belief and attitude.** *Hum. Relat.*, 1962, 15(1), 35-44.—"Belief" is defined as the probability dimension of a concept, and "attitude" as the evaluative dimension. A set of semantic differential scales, containing 5 scales measuring attitude and 5 measuring belief, were selected through role-playing procedures. Communications to different groups seemed to affect attitude and belief independently, and the reliability and validity of the distinction was established. "Belief in" a concept is distinct from "belief about" a concept; namely, the belief in the existence of a number of relationships between the concept and other concepts. Change in attitude toward a given concept can result from a change in belief about that concept. (20 ref.)—*W. W. Meissner.*

1051. Freedman, Mervin B. (Vassar Coll.) **Changes in six decades of some attitudes and values held by educated women.** *J. soc. Issues*, 1961, 17(1), 19-28.—Comparison of 6 decades of Vassar alumni on the California Public Opinion Survey (the authoritarianism and ethnocentrism scales) were made, with the finding that the various decades from 1904-56 differed significantly in their answers. It was considered that these findings reflected real differences in general attitude change and that the differences are related to cultural attitudes prevailing

at the time these individuals were in college. General conclusions were that present day attitudes are more flexible or, perhaps, more conforming in areas assessed by the F scale.—*A. Barclay.*

1052. Frumkin, Robert M. (State U. New York, Oswego) **Scientific millennialism as the coming world ideology.** *J. hum. Relat.*, 1962, 10(2-3), 145-162.—Scientific millennialism is an ideology based on the integration and reconstruction of 4 converging, somewhat utopian, ideologies: pacifism, humanism, cosmopolitanism, and internationalism. It is the idea that "the good life" is best achieved through science united with religion. According to this view, science and religion both fulfill the same basic need of people to know, to have some answers, some understanding of the basic questions concerning the nature of man and the universe. Scientific millennialism is defined in terms of the following factors: ultimate goals; character structure and life organization; role models; competition; cooperation; wealth and property; social change, intellectual inquiry, and creativity; war; some representative associations and groups; adequacy of normative structure; and meaning for the contemporary world.—*Author abstract.*

1053. Geiser, Robert L., & Newman, Roger W. (Boston U.) **Psychology and the legal process: Opinion polls as evidence.** *Amer. Psychologist*, 1961, 16, 685-690.—The purpose of this paper was "to describe the actual and potential use of . . . polls and surveys as legal evidence and to comment on relevant legal decisions for the benefit of interested psychologists." The value of public opinion polls was indicated in change-of-venue decisions, in attitudes toward euthanasia, in determining the moral climate of a community, and in determining whether a certain statement or epithet is capable of being defamatory in the public mind in connection with evidence of libel or slander. It was pointed out that the potential uses of survey evidence in litigation are numerous, and that the courts are showing increasing acceptance of this evidence. Steps toward insuring the psychologist's acceptance as an independent expert and areas of preparation by the psychologist for court testimony are suggested.—*S. J. Lachma.*

1054. Glantz, Oscar. (Michigan State U.) **Protestant and Catholic voting behavior in a metropolitan area.** *Publ. Opin. Quart.*, 1959, 23(1), 73-82.—Voting behavior of different religious groups may be complexly related to class, national origin, and region. Data are presented from an interview study in Philadelphia with 201 white male Protestants and 199 white male Catholics, following the 1952 presidential election. Comparison with data obtained at Elmira, New York, by Berelson, et al. in 1948 revealed these affirmations: "(1) At the middle and lower stratification levels, there was approximately twice as much Republicanism among Protestants as there was among Catholics; (2) these differences were still apparent . . . when Protestants and Catholics were compared within various class-identity and politico-economic groupings; and (3) among younger and older labor-union Protestants, the younger group returned a large vote to the Democratic party." No difference obtained between the religious groups' voting within the top economic level in Philadelphia; also, in the business and white-collar classes there, younger Catholics were less inclined than their elders to vote Republican.—*E. P. Hollander.*

1055. Himmelstrand, U. (Uppsala) **Social pressures, attitudes and democratic processes.** Stockholm, Sweden: Almqvist & Wiksell, 1960. 471 p.—4 empirical studies dealing with attitudes toward legal abortion, attitudes toward child-rearing practices, and political attitudes and behavior are described and related to a theoretical framework. The book is in 2 parts, the 1st theoretical, the 2nd empirical, with a discussion of the relation of the data to the theory. The data were collected in Sweden, and Swedish and English versions of the interview questions are provided. A bibliography and a list of symbols and abbreviations are included.—T. J. Banta.

1056. Hollander, E. P. (American U.) **Some effects of perceived status on responses to innovative behavior.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 247-250.—The degree of perceived status of an individual and its effect on the consequent evaluation of that person's behavior was studied. Persons perceived with a greater degree of status are more acceptable as authority figures and their idiosyncratic behavior receives greater acceptance.—G. Frank.

1057. Jahoda, Marie. **What is prejudice?** *World ment. Hlth.*, 1961, 13(1), 38-45.—A question and answer discussion of the subject reprinted from the 24, May 1960 issue of *Look Magazine*.—J. C. Franklin.

1058. Jones, Edward E., Gergen, Kenneth J., & Davis, Keith E. (Duke U.) **Some determinants of reactions to being approved or disapproved as a person.** *Psychol. Monogr.*, 1962, 76(2, Whole No. 521), 17 p.—2 groups of 40 female students each were selected from 210 who had taken the 4th revision of the Christie's Mach Scales designed to measure Machiavellian values. Those selected for the 2 comparison groups were from the upper 3rd and the lower 3rd of the scoring range, respectively. They were then interviewed in groups of 10, by 10 male graduate students. $\frac{1}{2}$ were urged to create a favorable impression. At the time of the 2nd interview the instructions were reversed. Following each interview the Ss received a standardized communication from her interviewer indicating his positive or negative reaction to her as a person. Her 2nd interview was with a different interviewer. The principal findings were that: (a) the S's impression of a disapproving source were far more negative in tone than that attained from an approving source; (b) those who received approving feedback considered themselves to be more accurate in self-presentation than those who created a negative impression; (c) Machiavellianism had no effect on the S's impression of the interviewers; (d) Ss became more self-deprecatory after negative interviews than after positive ones; (e) different patterns of reaction in self-presentation occurred depending upon where the Ss stood on the Mach scales, with the low's being more responsive to variations in feedback.—M. A. Seidenfeld.

1059. Kay, Herbert. (International Research Associates) **A new approach to projective testing in survey research.** *Publ. Opin. Quart.*, 1959, 23(2), 267-278.—The use of projective techniques in survey studies creates special problems. A report is presented of the trial of a projective test of anxiety employing pictures, the "Disguised Anxiety Scale." With Likert-type scoring, the corrected split-half reliability for 2 samples ($N=110$; $N=64$) was in each case .64 for 12 pictures. "This reliability may

be a bit too low to warrant the use of the scale for individual testing, but it seems adequate enough for large-scale use. . . . The DAS does not measure exactly the same thing that the Taylor Scale of Manifest Anxiety does, though there is some relationship between the two."—E. P. Hollander.

1060. Kelly, E. Lowell. (U. Michigan) **The reassessment of specific attitudes after twenty years.** *J. soc. Issues*, 1961, 17(1), 29-37.—Ss were re-examined after 20 years by means of Likert-type items relating to marital compatibility. Results indicated some stability of attitudes over time but wide changes in attitude were also found. Changes were generally in the direction of acceptance of more conventional positions, reflecting perhaps a tendency toward conformity to prevailing cultural values and attitudes.—A. Barclay.

1061. Koenig, Frederick W., & King, Morton B., Jr. **Cognitive simplicity and prejudice.** *Soc. Forces*, 1962, 40(3), 220-222.—Interviews with 175 students in a southwestern university supported the hypothesis that cognitive simplicity and prejudice are positively related. Devices used were questions about admitting Negroes to specific campus activities and facilities and a Crespi thermometer for indicating personal attitude toward integrating or not integrating the university. Intolerant students were less accurate in predicting the responses of others and showed a greater tendency to perceive others' responses as like their own.—A. R. Howard.

1062. Kosa, J., & Schommer, C. O. (U. North Carolina) **Sex differences in the religious attitudes of Catholic college students.** *Psychol. Rep.*, 1962, 10(1), 285-286.—From responses of 362 male and 174 female college students on 2 indices of religious attitude, it was observed that males score lower and show greater variability as a function of socioeconomic and scholastic factors than females.—B. J. House.

1063. Kraus, Sidney. (Indiana U.) **Modifying prejudice: Attitude change as a function of the race of the communicator.** *Audiovis. Commun. Rev.*, 1962, 10(1), 14-22.—An experiment concerned with the relative effectiveness of Negro and white actors in changing attitudes toward Negroes as measured by semantic differential scales. Four 11-minute kinescope, 2-actor recordings were produced with similar dialog but with either 2 white, 2 Negro, Negro-white, or Negro-white (reversed role) performers. The films were shown to various samples of 11th-grade white children. The film versions using both Negro and white performers produced greater "attitude change" than the other 2 versions.—R. E. Schultz.

1064. Lingoes, James Charles. (Michigan State U.) **Multiple scalogram analysis: A generalization of Guttman's scale analysis.** *Dissert. Abstr.*, 1961, 21(11), 3524-3525.—Abstract.

1065. Lustig, Norman I. **The relationships between demographic characteristics and pro-integration vote of white precincts in a metropolitan southern county.** *Soc. Forces*, 1962, 40(3), 205-208.—A 1958 Democratic primary in Florida between 2 candidates of clearly opposed views was analyzed. 5 demographic variables (education, income, sex ratio, age, and percentage of children) were correlated with pro-integration vote in 45 precincts.

Education and income revealed statistically significant relationships.—A. R. Howard.

1066. McCormack, Thelma H., Elkin, Frederick, & Westley, William A. (U. Toronto) *Anxiety and persuasion. Publ. Opin. Quart.*, 1959, 23(1), 127-133.—A questionnaire study was conducted on attitudes toward a Red Cross blood donation drive of 260 male university students, representing donors and nondonors. A campaign to reduce anxiety by appealing to group values, e.g., loyalty to fraternity, was found to alienate some students and be insufficient for others. "Left to his own ideational devices, the individual overcame his anxiety by defining blood donation as a high moral imperative. The pattern of preference for idealistic symbols, transcending personal and immediate advantage, is contrary to current theories of persuasion, which emphasize the effectiveness of reference group values, ego involvement . . . and other concepts centering about primary group behavior and pragmatic symbols."—E. P. Hollander.

1067. McCoy, Edward P. (Michigan State U.) *Influence of color on audiences' rated perception of reality in film. Audiovis. Commun. Rev.*, 1962, 10(1), 70-72.—4 10-20-second film scenes were printed in both black-and-white and color versions. The black-and-white scenes were shown to 61 Ss in 3 summer college classes; the color scenes to 103 Ss in 4 classes. On 3 of the 4 scenes the black-and-white version "elicited a higher percentage of responses indicating belief that the scenes were shot from actuality."—R. E. Schutz.

1068. McGuire, W. J. (Columbia U.) *Resistance to persuasion conferred by active and passive prior refutation of the same and alternative counterarguments. J. abnorm. soc. Psychol.*, 1961, 63(2), 326-332.—College students were Ss in a study to test hypotheses regarding the vulnerability of arguments to counterarguments. The effect of prior active or passive participation in defense of an idea held; the strength of the present counterargument, and whether the counterargument involved the same or novel material, upon attitude change was investigated. Differential interaction effects were found which indicated that immunization against change was best only under certain conditions. The results are related to previous work by the author and others.—G. Frank.

1069. Martin, James G. (Northern Illinois U.) *Intergroup tolerance-prejudice. J. hum. Relat.*, 1962, 10, 197-204.—Group prejudice is defined as: negative, unfavorable, hostile (or positive, favorable, friendly) attitude toward a group which results in prejudgment of its members." There are 2 basic forms of group prejudice: (a) ethical and (b) empirical. The ethical form is simply a generalized value judgment, e.g., "I don't like Italians." The empirical form, however, is an invalid impression of a group related to prejudice, e.g., "I don't like Italians because they are blond-haired." Various arguments are presented against the practice of prejudice, the most significant one demonstrating that it is socially dysfunctional.—R. M. Frumkin.

1070. Mehling, Reuben. (Indiana U.) *A simple test for measuring intensity of attitudes. Publ. Opin. Quart.*, 1959, 23(4), 576-578.—With 2 groups of 16 Ss each, a scatter diagram was made in which

every S's rating for each intensity scale was plotted against his response to the related semantic differential scale, and a V-shaped curve resulted similar to that found by Cantril and by Suchman in their studies of attitudes. "It would appear that the semantic differential as used in this study does measure both the direction and intensity of attitude."—E. P. Hollander.

1071. Merrill, Irving R. (U. California, San Francisco Medical Center) *Attitude films and attitude change. Audiovis. Commun. Rev.*, 1962, 10(1), 3-13.—Specially prepared paper-pencil measures of "salience, cognitive change, and affect" were administered to 181 Navy reservists both before and after viewing either an "information," "attitude," or "non-related" traffic safety film. Results were analyzed to determine the effect of type of film viewed, time of post-test, and performance on the Flexibility scale of the California Psychological Inventory on shifts in pre- and posttest scores.—R. E. Schutz.

1072. Middleton, Russell. *The civil rights issue and presidential voting among southern Negroes and whites. Soc. Forces*, 1962, 40(3), 209-215.—130 Negro and 147 white registered voters were asked just prior to the general election of 1960 whether they would vote for Nixon or Kennedy. A sampling of respondents via mail survey, immediately following the election, indicated a slight shift in voting intentions after having been interviewed. The college-educated white tended to support Nixon; the college-educated Negro leaned toward Kennedy. White voters emphasized party loyalty; Negro voters laid more stress on issues. "The civil rights issue will clearly continue to play a major role in American presidential elections."—A. R. Howard.

1073. Minkowich, A., & Shaked, A. *Haishiyut hasamkhutit. [The authoritarian personality.] Megamot*, 1962, 12, 24-47.—After theoretical explanations and a review of studies on the authoritarian personality, a pilot study carried out in Israel is given. It aims to study the authoritarian tendency and to compare norms of different ethnic and cultural strata in Israel. A Hebrew application of the F scale is described. 280 university and secondary school students, soldiers, and working youngsters (age 16.5-21; education 8-15 years) were examined in 2 stages. The connection between F scores and education, age, sex, and ethnic origin is given, as well as intercultural comparisons with the tendency to authoritarianism in the United States, Lebanon, and Germany. (English summary)—H. Ormian.

1074. Nunnally, Jum C., & Bobren, Howard M. (U. Illinois) *Attitude change with false information. Publ. Opin. Quart.*, 1959, 23(2), 260-266.—192 undergraduates were given 1 of 6 written messages, 4 concerning different explanations of catatonic schizophrenia and 2 messages (control) not concerned with mental illness; 2 of the "catatonic" messages gave incorrect explanations, and 2 gave plausible explanations. A semantic differential form elicited effects of these treatments on attitudes toward mental illness. Ss who read any of the 4 "catatonic" messages expressed more favorable attitudes than those who read "control" messages. "The results of this study suggest that the popular fear of mental illness and the mentally ill will be reduced if plausible-sounding information is given. . . . It is not suggested that the public be provided with incorrect

information in order to promote favorable attitudes. However, the wisdom of destroying false beliefs when there are no correct beliefs to give in return is questionable . . . [since] existing false beliefs sometimes serve a useful purpose in reducing feelings of 'threat.'"—E. P. Hollander.

1075. Ohashi, M. [Studies on choice behavior and interpersonal perception: V. A replication study with a somewhat different procedure.] *Jap. J. Psychol.*, 1962, 32, 395-404.—A study on relationships analyzing the triad of p's attitude toward q, p's attitude toward o, and q's attitude toward o as perceived by p. Results of previous experiments were not consistent with Heider's theory of balance but were consistent with the author's predictions. This replication was completely compatible with the author's results but not with Heider's.—A. Barclay.

1076. Raven, B. H., Fishbein, M. (U. California, Los Angeles) **Acceptance of punishment and change in belief.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 411-416.—Ss were placed in a situation wherein they were led to expect to experience ESP phenomena. To report no ESP reception led to the experience of electric shock. It was hypothesized that to reduce the cognitive dissonance that had been created, S would reject belief in ESP thereby justifying the experience of the shock. Belief in ESP, before and after the experimental conditions, was determined from an attitude scale regarding this phenomenon (Fishbein & Raven, 1959). The results supported the hypothesis, particularly with regard to the females, less so for the males. It was assumed that males had greater tolerance for the shock, hence the divided findings.—G. Frank.

1077. Reigrotski, Erich, & Anderson, Nels. (UNESCO Inst. Social Sciences) **National stereotypes and foreign contacts.** *Publ. Opin. Quart.*, 1959, 23(4), 515-528.—In 1956-1957, in an attempt to identify and examine the national stereotypes of the Germans and the French as held by other people and by themselves, a coordinated questionnaire was used to interview people in Belgium (482 Flemish and 597 Walloons), France (2006), Germany (2041), and Holland (1000). Respondents were: (a) given 12 descriptive terms and asked which seemed to describe the other peoples and their own people, (b) asked to describe in their own words each of the peoples, and (c) which of the others they considered easiest and which most difficult to get along with. "More important than the identification of stereotype traits, this study lends support to the idea that stereotypes tend to be modified through education and through foreign contact and acquaintance."—E. P. Hollander.

1078. Rettig, S., & Pasamanick, B. (Ohio State U.) **Invariance in factor structure of moral value judgments from American and Korean college students.** *Sociometry*, 1962, 25(1), 73-84.—The factorial structures of the value judgments of 489 American and 513 South Korean college students were compared by "transformation analysis. . . the structure of moral judgments on a specified set of moral issues is considerably invariant across two very different cultures. . . [Lack of invariance appears when] historical conditions predominately [affect] . . . the structure of only one dimension, puritanical morality, which accounts for less than 10 per cent of the explained variance of 50 moral issues

under study. Thus, the thesis of complete ethical relativity appears to be seriously challenged when the structure of moral judgments is the criterion for comparison."—H. P. Shelley.

1079. Rhodes, A. Lewis. (Southern Methodist U.) **Authoritarianism and alienation: The F scale and the Srole scale as predictors of prejudice.** *Sociol. Quart.*, 1961, 2, 193-202.—A modified version of the California F scale and the Srole scale of anomie were administered to a sample of 1027 white male and female high school seniors in Tennessee. Data were also obtained on the educational attainments, religious preferences, and occupational levels of the students' parents and on the peer group activities of the students. There was a significant linear relationship between F scale and anomie scores ($r = +.41$), but a curvilinear relationship ($\eta^2 = .82$) seemed better to describe the data. The moderate, positive relationship between F scale and anomie scores held up when controls for various background factors were introduced, indicating that the relationship was partially independent of social structural factors.—K. E. Davis.

1080. Rosenbaum, Milton E., & Zimmerman, Isabel Madry. (State U. Iowa) **The effect of external commitment on response to an attempt to change opinions.** *Publ. Opin. Quart.*, 1959, 23(2), 247-254.—78 male university students known to hold pro-segregation attitudes were exposed to a facsimile radio program, some in a "private" condition, others in a "public" condition with fellow Ss. Before this, about $\frac{1}{3}$ had been told they were chosen for their pro-segregation position (congruent commitment), another $\frac{1}{3}$ for their antisegregation position (incongruent commitment), and the last $\frac{1}{3}$ nothing (control). Questionnaire responses indicated that "attribution of attitude position by an external source appears to affect response to a succeeding influence attempt when the attribution is congruent with the original position of the individual but not when it is incongruent. . . . No significant effect is found in terms of the public-private dimension as set up here."—E. P. Hollander.

1081. Rothman, Jack. (Columbia U.) **Minority group identification and intergroup relations: A study of Jewish identification and its relationship to outgroup attitudes and associations in a sample of minority group adolescents.** *Dissert. Abstr.*, 1961, 21(12), 3875.—*Abstract.*

1082. Scherke, Felix. **Der politische Charakter.** [The psychological character of politics.] Stuttgart, Germany: Hirzel, 1961. 115 p.—"Political character . . . [is] that aspect of character which is concerned with views and regulations made to arrange and determine attitude and behavior of the individual towards the community and its order, and of the community towards the individual." It develops in 4 stages: (a) undifferentiated, prelogical, harmonic community; (b) differentiated despotism and feudalism; (c) individuation (finding the ego, subjective intellectualism); and (d) maturation (finding the self, objective rationalism). The characterological theory used is that of Kunkel. A chapter on education for a mature community is added.—J. C. Brengelmann.

1083. Searles, Ruth, & Williams, J. Allen, Jr. **Negro college students' participation in sit-ins.**

Soc. Forces, 1962, 40(3), 215-220.—Questionnaire data from over 800 students at 3 Negro colleges seem to support the "thesis that protests were precipitated by Negro students' reference to the white middle class as a standard of comparison." Indications for additional research are cited.—A. R. Howard.

1084. Seth, Madan Gopal. (Boston U.) A study of attitudinal change of Indian students in the United States. *Dissert. Abstr.*, 1961, 21(10), 3160.—Abstract.

1085. Siegman, A. W. (Bar-Ilan U., Israel) A cross-cultural investigation of the relationship between ethnic prejudice, authoritarian ideology, and personality. *J. abnorm. soc. Psychol.*, 1961, 63(3), 654-655.—The studies done re the validation of the relationship between prejudice and authoritarianism on American Ss confounded ethnic prejudice and political attitude by the nature of the sample. An effort was made to investigate ethnic prejudice (as measured by the F Scale) independent of political (radical-conservatism) commitment by using Ss (Israeli students) demonstrating differential attitudes towards Arabs, but unanimity of feeling against Jewish immigrants from North Africa. The results provided a cross-cultural validation of the relationship between prejudice and authoritarianism.—G. Frank.

1086. Walters, E. L., Thomas, E. L., & Acker, C. W. (U. Toronto) Enhancement of punitive behavior by audio-visual displays. *Science*, 1962, 136(3519), 872.—A group of male hospital attendants watched the knife-fight scene from the motion picture *Rebel Without a Cause*. A 2nd control group watched an innocuous educational film. The group who watched the fight (the motion picture with aggressive content), and who were then required to run a conditioning experiment, punished errors more severely, using a significantly higher level of intensity of the punitive electric shock, than did the control group.—Journal abstract.

1087. Weinstein, E. A., & Geisel, P. N. (Vanderbilt U.) Family decision making over desegregation. *Sociometry*, 1962, 25(1), 21-29.—"A sample of 88 Nashville Negro families having children eligible to attend desegregated schools was interviewed. In 38, the child was (or had been) enrolled in a desegregated school; in 50, the child was enrolled in a segregated school." The desegregated group was of a higher socioeconomic status. "Variables characterizing the decision-making process itself were generally similar in both groups. The major differences appeared to be attitudinal, (and remained when SES was statistically controlled.) The desegregated group showed considerably more interest in the general issue of school desegregation and thought it would have more favorable effects on the child. The segregated group was characterized by significantly less favorable attitudes toward 'pioneering' in race relations, and was more socially alienated."—H. P. Shelley.

1088. White, Ralph K. (United States Information Agency) Soviet reactions to our Moscow exhibit: Voting machines and comment books. *Publ. Opin. Quart.*, 1959, 23(4), 461-470.—A report and discussion of Russian visitors' responses to the American Exhibit in Moscow in the summer of 1958. Some summary points: "There were many indications of a basic friendliness to America in the Soviet

public, and great curiosity about life in America . . . evaluations of the Exhibit by way of the voting machines (15,000 'voters') were 85 per cent favorable. . . the seventy-five guides and other Russian-speaking Americans were continually surrounded by eager crowds questioning them about every aspect of American life. . . The voting machines and comment books proved most useful in studying differential reactions to different parts of the Exhibit. . . In evaluating over-all reactions . . . the usefulness of both techniques seems limited by a very sizable positive self-selection bias."—E. P. Hollander.

1089. Withey, Stephen B. (U. Michigan) Public opinion about science and scientists. *Publ. Opin. Quart.*, 1959, 23(3), 382-388.—The public remains in relative ignorance about science, and popular attitudes are naive and unrealistic. Some results are reported from a study conducted for the National Association of Science Writers to determine how people react to the presentation of science in the mass media, and comparisons are drawn with other studies. "About half the adults said that science could study anything! One quarter were not sure of limitations, and another quarter felt science had real limitations, usually in areas of human experience or behavior. When directly queried, only about 1 in 2 would go along with the notion that we can ever really understand human behavior through scientific study. . . The great majority of persons (83 per cent) felt that the world is better off because of science. About 1 in 10 offered some qualification."—E. P. Hollander.

GROUP INFLUENCES

1090. Anderson, N. H., & Barrios, A. A. (U. California, Los Angeles) Primacy effects in personality impression formation. *J. abnorm. soc. Psychol.*, 1961, 63(2), 346-350.—Following the paradigm of research of Asch (1946) and Luchins (1957, 1958), the influence of presentation of data upon the formation of an impression of personality was studied. By presenting some adjectives 1st in one set, 2nd in others, and by delaying presentation of 2nd set of adjectives a few seconds, primacy and recency effects were investigated. In general, primacy effects were significant but recency effects were not.—G. Frank.

1091. Bates, Alan P., & Babchuk, Nicholas. (U. Nebraska) The primary group: A reappraisal. *Sociol. Quart.*, 1961, 2, 181-191.—Cooley's concept of the primary group is held to be in need of clarification if it is to be useful in generating research. The authors argue that in his definition 2 different dimensions have been confused: the sociological dimension (which includes such variables as group size, quantity of interaction, and homogeneity of member characteristics) and the social psychological dimension (which refers to the readiness of members to engage voluntarily in a wide variety of activities together and to the existence of a high level of mutual attraction among group members). The authors assert that the concept should be defined in terms of the social psychological dimension with the sociological variables being considered as conditions affecting the development of primary groups.—K. E. Davis.

1092. Blake, R. R., & Mouton, J. S. (U. Texas) Comprehension of communality in competing solutions. *Sociometry*, 1962, 25(1), 56-63.—"This

study has investigated comprehension of contending group members of points of similarity between proposals submitted by both groups under conditions of inter-group competition. Twenty-six groups, composed of 217 subjects who were in eleven human relations laboratory programs, participated in a standard sequence of ingroup and intergroup activities. During competition groups submitted solutions to a problem. Results demonstrate that, under competitive intergroup conditions, group members are relatively blind to points of communality between their own and contending proposals. The direction of error is for members incorrectly to assign common items to their own solution only, not recognizing that these items are also contained in the position of a competitor.—H. P. Shelley.

1093. Claster, Daniel Stuart. (Columbia U.) Friendship formation in two adjacent interracial housing projects. *Dissert. Abstr.*, 1961, 22(1), 346.—Abstract.

1094. Cleveland, Sidney E., & Morton, Robert B. (Baylor U.) Group behavior and body-image: A follow-up study. *Hum. Relat.*, 1962, 15(1), 77-85.—Barrier scores, representing an index of body-image integrity, were obtained by the administration of the Holtzman Inkblot Test to 69 typical VA openward psychiatric patients. Sociometric questionnaires provided information on group behavior. High barrier Ss received significantly more nominations as influential, independent, active, and goal-striving group members. Low barrier Ss were more frequently designated as parochial and selfish in their group behavior. High barrier Ss were less influenced by group opinion than low barrier Ss.—W. W. Meissner.

1095. Ehrlich, H. J., Rinehart, J. W., & Howell, J. C. (Ohio State U.) The study of role conflict: Explorations in methodology. *Sociometry*, 1962, 25(1), 85-97.—“The results and methods of four role conflict studies were compared in an attempt to ascertain (a) the relative efficacy of various role conflict variables as predictors of role conflict resolutions; (b) the effect of different operational definitions of these variables on the prediction of role conflict; and (c) the degree of stability these variables manifest as predictors of conflict resolution.” With comparable operations and procedures population differences may account for the differences obtained. “Utilizing the perceived expectations of certain audience groups as criteria, approximately the same degree of predictive accuracy was achieved as that achieved using role conflict variables as criteria.” Legitimacy and sanctions are not the most parsimonious predictors.—H. P. Shelley.

1096. Elliott, Charles Henry, Jr. (Cornell U.) Some small group research variables and interaction in the marital dyad as reported by 120 college-educated couples. *Dissert. Abstr.*, 1961, 21(12), 3873.—Abstract.

1097. Exline, R. V. (U. Delaware) Need affiliation and initial communication behavior in problem-solving groups characterized by low interpersonal visibility. *Psychol. Rep.*, 1962, 10(1), 79-89.—Score on n affiliation test was related to content of 1st written message in a group problem-solving task for 16 groups each of 3 men and 3 women. Women had higher n affiliation scores and

wrote more personal messages than men, whose messages were more task oriented. There was a non-significant tendency for high n affiliation scorers to write more personal messages. High scorers made fewer references to group decisions than did low scorers. Several interpretations of the results were discussed.—B. J. House.

1098. Flood, Merrill M. (Ed.) A symposium on game theory. *Behav. Sci.*, 1962, 7, 1-102.—(See 37: 1103, 1104, 1109, 1110, 1112, 1121)—J. Arbit.

1099. Gillis, Willie Mae. (U. Colorado) Influence of position within a social structure upon levels of expected and actual performance. *Dissert. Abstr.*, 1961, 21(10), 3180.—Abstract.

1100. Golembiewski, Robert T. (U. Illinois) The small group: An analysis of research concepts and operations. Chicago, Ill.: Univer. Chicago Press, 1962. xii, 303 p. \$6.00.—“The aim . . . is the determination of the degree of convergence in small-group analysis toward a set of concepts and operations which will permit fruitful integration and synthesis.” Over 1500 reports are reviewed and arranged in a meaningful framework. Among the topics are those dealing with various aspects of small-group dimensions: the structural, the style, and the population. Suggestions for further research are given.—E. D. Lawson.

1101. Graham, D. (U. Durham, England) Experimental studies of social influence in simple judgment situations. *J. soc. Psychol.*, 1962, 56, 245-269.—A review of the experimental work in this field revealed 3 main factors: (a) relatively asocial, (b) social, and (c) personality. It was felt that insufficient attention had been given to questions of meaning and motivation, and that studies were needed on conforming behavior in real life situations.—Author abstract.

1102. Gurman, E. B., & Bass, B. M. (Mississippi Southern Coll.) Objective compared with subjective measures of the same behavior in groups. *J. abnorm. soc. Psychol.*, 1961, 63(2), 368-374.—“Discussion behavior was measured objectively by a social analog computer, while subjective assessments were made by observers and participants aided by a check list. . . . There tended to be agreement between the two different methods of measurement. . . . Observers and participants had difficulty in inferring private events that took place during the discussion. The difficulty of rating private events suggests that observers' ratings are most appropriate for overt events. Yet the successful study of covert events require reliance on objective measurement.”—G. Frank.

1103. Harsanyi, John C. (Wayne State U.) Measurement of social power in n-person reciprocal power situations. *Behav. Sci.*, 1962, 7(1), 81-91.—“This paper tries to extend the concepts of amount of power and strength of power to n-person reciprocal power situations, where all n participants have some power over one another and over the joint policies of their group. Intuitively, the amount of a person's power is a measure of the probability of his being able to achieve adoption of joint policies agreeing with his own preferences; while the strength of his power is a measure of the strength of the incentives he can provide for the other partici-

pants to agree to his policy proposals, and more generally, the strength of his bargaining position against the other participants. To define the strength of power the paper uses the author's bargaining model for the n-person game. The measure obtained in this way can be regarded as a generalization of the power measure of Shapley and Shubik."—*J. Arbit.*

1104. Harsanyi, John C. (Wayne State U.) **Measurement of social power, opportunity costs, and the theory of two-person bargaining games.** *Behav. Sci.*, 1962, 7(1), 67-80.—Several authors have recently suggested measuring social power in terms of its effects; that is, in terms of the changes that A can cause in B's behavior. This paper argues that an adequate measure of power must also contain information on the 2 parties' opportunity costs—the costs to A of acquiring or using his power over B, which the paper calls the costs of A's power; and the costs to B of noncompliance, which measure the strength of B's incentives to compliance and which the paper calls the strength of A's power over B. For bilateral power situations where both parties can exert pressure on the other, a somewhat different game-theoretical measure for the strength of A's power is developed. (20 ref.)—*Journal abstract.*

1105. Hill, Arthur Henry. (U. Minnesota) **Social influence in interdependent escape.** *Dissert. Abstr.*, 1961, 21(10), 3181-3182.—*Abstract.*

1106. Lerner, Melvin J., & Becker, Selwyn. (U. Kentucky) **Interpersonal choice as a function of ascribed similarity and definition of the situation.** *Hum. Relat.*, 1962, 15(1), 27-34.—The relation between the individual's choice of a "similar" or "dissimilar" other person and his attempts to achieve cognitive "balance" in various situations was tested in 2 experiments. In the 1st, 32 high school students preferred similar others as partners in a game in which both could win. In a game in which one partner won at the expense of the other, Ss picked dissimilar partners. In the 2nd experiment, 29 college psychology students could communicate with either a similar (psychology) or dissimilar (nonpsychology) student, after these others had made a social judgment different from that of S. The results supported the balance hypothesis, which predicted choice of a similar other, when the consequences of interaction were irrelevant; when S had to gain agreement from the other, the balance hypothesis was not supported.—*W. W. Meissner.*

1107. Mazor, Moshe. Darkhey ish veisha. [Ways of men and women: Chapters on the psychology of friendship, love, and sex.] Tel Aviv, Israel: Am Oved, 1962. 207 p.—"My main purpose is to impart to the general cultural reader basic information on a common way of life of the couple within the family." The content is based on experiences of psychotherapeutic, depth-psychology minded counseling in problems of marriage, harmony and disharmony in human relations, and the pathology of sexual life.—*H. Ormian.*

1108. Patterson, Samuel C. (AFL-CIO, Washington, D. C.) **Patterns of interpersonal relations in a state legislative group: The Wisconsin Assembly.** *Publ. Opin. Quart.*, 1959, 23(1), 101-109.—70% of the members of the 1957 Wisconsin Assembly were interviewed in early 1958; and an additional 17% were reached by mail, to study interpersonal

relations in that body. Sociometric analysis revealed that friendship choices paralleled patterns of influence and communication among the legislators, hence friendship roles were functional roles. "Individuals who assume the legislative role have diverse backgrounds and diverse social, political, and economic experience, and different reference groups are salient for them. The informal friendship structure of the legislature tends to lessen such differences, to mitigate against the development of potential conflicts, to provide channels of communication and understanding among members who share goals."—*E. P. Hollander.*

1109. Rapoport, A., & Orwant, C. (U. Michigan) **Experimental games: A review.** *Behav. Sci.*, 1962, 7(1), 1-37.—A review of research into game theory and decision making. The review considers both 2- and n-person games, zero-sum and non-zero-sum games, games where payoffs are known and unknown, and simulations which involve games. A glossary is appended. (47 ref.)—*J. Arbit.*

1110. Rapoport, Anatol; Chammah, Albert; Dwyer, John, & Gyr, John. (U. Michigan) **Three-person non-zero-sum nonnegotiable games.** *Behav. Sci.*, 1962, 7(1), 38-58.—4 experiments are reported in each of which 3 persons participated. Communication among the parties was, in general, impossible. The findings are analyzed, and a mathematical model is proposed which is relatively effective in predicting the gross percentage of cooperative behavior in each game. The differing personalities of the players significantly affected their selections of strategies.—*Journal abstract.*

1111. Rosenberg, L. (Purdue U.) **Group size, prior experience, and conformity.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 436-437.—An effort was made to validate the findings of 2 previous workers regarding the effect of the size of a group (Asch, 1952) and prior experience (Mausner, 1953, 1954, 1957) upon conformity in the judgment of the length of lines. The results of Asch and Mausner were reproduced; there is a curvilinear relationship between size of a group (from 2 to 5) and influence on S to conform to what he believes are the estimates of the lines made by others. Prior experience in making judgments of the lines was also found to influence the accuracy of judgment.—*G. Frank.*

1112. Shapley, L. S. (RAND Corp., Santa Monica, Calif.) **Simple games: An outline of the descriptive theory.** *Behav. Sci.*, 1962, 7(1), 59-66.—Simple games refer to multiperson games in which each coalition that might form is either all-powerful or completely ineffectual. The mathematical techniques and theoretical structure involved in these simple games are discussed. Comments are made regarding the application of this model to the United States Congress, the United Nations Security Council, or "any 'political' structure in which power and authority, rather than a monetary type of payoff, is the fundamental driving force." Implications for organizations, committees, and "neural nets" are noted.—*J. Arbit.*

1113. Shaw, M. E., & Penrod, W. T., Jr. (U. Florida) **Validity of information, attempted influence, and quality of group decisions.** *Psychol. Rep.*, 1962, 10(1), 19-23.—"Five groups of three persons each were run in each cell of a 2 × 4 fac-

torial design involving two degrees of attempted influence (weak and strong) and four degrees of information validity (.00, .331%, .662%, & 1.00). Each group was required to make a series of binary choices." A confederate, posing as an S, in each group proposed choices. "Information validity was positively related to the group's performance score, even when the confederate's information resulted in well below chance performance." No difference was obtained between weak and strong influence.—*B. J. House.*

1114. Smith, Alexander B., Bassin, Alexander, & Froehlich, Abraham. (Kings County Court) Interaction process and equilibrium in a therapy group of adult offenders. *J. soc. Psychol.*, 1962, 56, 141-147.—This study was part of a larger interdisciplinary study focused on the interaction process and the sociometric relations developed within a therapy group of probationers. It was found that the phase sequence of the probation therapy group did not follow the phase sequence pattern of Bales' laboratory problem solving model. Furthermore, the failure of the probation group to establish equilibrium suggested that this group was more nearly a therapy group of the kind described by Talland than a problem solving group.—*Author abstract.*

1115. Sommer, R. (U. Alberta, Edmonton) The distance for comfortable conversation: A further study. *Sociometry*, 1962, 25(1), 111-116.—38 males and 144 females after touring a large mental hospital were asked to discuss their opinions. Pairs of Ss were ushered to a portion of a large lounge where there were 4 chair separated by previously arranged distances. Data consists of the chairs selected by S for their discussion. Preferences for sitting across from one another have 2 exceptions: when the distance across is too far for comfortable conversation and when the distance across exceeds the distance side-by-side. When the 2 distances are equal, or when the distance side-by-side exceeds the distance across, people strongly prefer to sit opposite one another. Possible modifications on the findings are discussed, e.g., size of the room, topic being discussed, relationship between people.—*H. P. Shelley.*

1116. Strodtbeck, F. L., & Hook, L. H. (U. Chicago) The social dimensions of a twelve-man jury table. *Sociometry*, 1961, 24, 397-415.—"The multidimensional scaling . . . of a matrix of post-session preferences of jurors resulted in the identification of table length, visual accessibility, and table width as the three primary components of 'social distance' which . . . was postulated to be inversely related to the square root of preferences received. The End and Middle positions were shown to have smaller contributions from each of the components of 'social distance' than the Flank and Corner positions. The 'nearness' of a person . . . to a given juror is believed to have arisen because his reactions to the trial could be inconspicuously watched, and when this was done, the reference juror tended to deduce that he was likeminded and dependable to a greater degree than jurors whose reactions were less easily observed."—*H. P. Shelley.*

1117. Tannenbaum, A. S. (U. Michigan) Reactions of members of voluntary groups: A logarithmic function of size of group. *Psychol. Rep.*, 1962, 10(1), 113-114.—In a study of groups of League of Women Voters it was found that reactions

of members were correlated more highly with log size of group than with linear size. A group analogue to the Weber-Fechner law is discussed.—*B. J. House.*

1118. Turk, Theresa, & Turk, H. (U. North Carolina) Group interaction in a formal setting: The case of the triad. *Sociometry*, 1962, 25(1), 48-55.—"Conferences held by three-person nursing teams permitted both special propositions about the triad and general propositions about the small group to be investigated within a formal 'natural' setting. The research confirmed Caplow's prediction that three-person systems will be free of coalitions if the power of one member is greater than that of the other two combined. It also confirmed predictions, felt to hold true for any small group, that both the volume of communication and the rate of positive socio-emotional support between any pair of members is a function of the combined power of the pair, with the higher-powered member communicating more to the other and supporting him more. The implications of these findings for research in formal organization are discussed in functional terms."—*H. P. Shelley.*

1119. Vidulich, R. N., & Kaiman, I. P. (Louisiana State U.) The effects of information source status and dogmatism upon conformity behavior. *J. abnorm. soc. Psychol.*, 1961, 63(3), 639-642.—This study explored the relationship between degree of authoritarianism, as measured by Rokeach's (1960) Dogmatism Scale, and susceptibility to influence by individuals of high and low social status. College Ss were placed in the autokinetic problem (see 10: 1332); a confederate of E, introduced as either a research scientist or a high school senior, gave his responses to the situation prior to S. The confederate's judgments were contrived so as to disagree with S's. Ss high in authoritarianism tended to agree with (conform to) the responses of the "scientist"; Ss low in authoritarianism, with the "high school student."—*G. Frank.*

1120. Wiest, William M., Porter, Lyman W., & Ghiselli, Edwin E. (U. California, Berkeley) Relationship between individual proficiency and team performance and efficiency. *J. appl. Psychol.*, 1961, 45(6), 435-440.—Using 64 pairs of college students doing jigsaw puzzles, team and individual performance was compared. They could work the puzzles better alone than when doing it in pairs cooperatively, however, relatively poor prediction is obtained from measures of individual proficiency. The performance of the most efficient member of a team, however, predicted slightly better both team performance and team efficiency. "The more similar the two members of a team were in individual proficiency, the more likely they were to form a proficient and effective team."—*J. W. Russell.*

1121. Wilson, Kellogg V., & Bixenstine, V. Edwin. (Nebraska Psychiatric Inst.) Forms of social control in two-person, two-choice games. *Behav. Sci.*, 1962, 7(1), 92-102.—In this paper, the importance of power as an influence on choice of strategies is analyzed; and the application of game theoretic concepts to real-life social conflicts is discussed. In mixed-motive games, the amount of control which a player can exercise over his own and his opponents' gains and losses obviously has an important influence on choices of strategy for both.—*Journal abstract.*

1122. Wilson, W., & Miller, N. (Northwestern U.) Shifts in evaluations of participants following intergroup competition. *J. abnorm. soc. Psychol.*, 1961, 63(2), 428-431.—"Intergroup competition was simulated by having two-man teams compete against two stooges on several tasks. Winning and losing was manipulated by having the stooges win against half the teams and always lose against the other half. The difference in favorability of a team's before and after ratings of the other participants on 27 personality traits was the dependent variable . . . the hypothesis that 'liking' is increased by interaction received . . . support."—G. Frank.

LEADERSHIP

1123. Armila, Jose. (U. Michigan) Leader-follower frame of reference in political behavior. *Dissert. Abstr.*, 1961, 21(12), 3869-3870.—*Abstract.*

1124. Barlund, Dean C. (Northwestern U.) Consistency of emergent leadership in groups with changing tasks and members. *Speech Monogr.*, 1962, 29, 45-52.—A situational theory of leadership proposes that people are leaders because their talents are momentarily essential to a group. To measure the degree of consistency in leadership status, 25 Ss were randomly assigned to 6 groups attempting to solve problems having motor, artistic, mathematical, literary, social, and spatial characteristics. Upon concluding each stage leaders were nominated for another round of a similar activity. Leadership was found to depend upon situational variables, 2 of which seemed to involve changes in group tasks and membership.—D. Lebo.

1125. Cohen, Arthur M., & Bennis, Warren G. (Boston U.) Continuity of leadership in communication networks. *Hum. Relat.*, 1961, 14(4), 351-367.—A Leavitt-type arrangement (see 25: 7439) was employed in 2 experiments on leader selection in various communication systems. The 1st experiment showed that groups which were changed from a wheel system to a circle system tended to organize themselves into the more efficient chain system, but with different leaders than in the antecedent wheel arrangement. The 2nd experiment confirmed this finding and also indicated that the opportunity to maintain or change leaders in the antecedent wheel networks led to greater continuity of leadership when the groups developed into chains. (17 ref.)—W. W. Meissner.

1126. Kipnis, David, & Lane, William P. Self-confidence and effective leadership. *USN Bur. Naval Personnel tech. Bull.*, 1962, No. 62-3. iv, 11 p.—This study deals with the relationship between petty officers' confidence in their leadership abilities and the kinds of techniques of supervision they use. Petty officers who lacked self-confidence more frequently placed reliance upon administrative regulations, such as placing a man on report, as well as unofficially turning their supervisory problems over to a superior. Petty officers high in self-confidence were more likely to place reliance upon face-to-face discussions with subordinates. The findings suggest a need to provide the young petty officer with training and experience in handling men and in solving supervisory problems before he is given direct leadership responsibilities.—*USN BNP.*

1127. Scarborough, O., & Harris, B. M. (U. Texas) Graduate students' perceptions of leader-

ship roles. *J. teacher Educ.*, 1962, 13, 60-64.—An investigation of patterns of role perceptions of graduate students in educational supervision indicated the existence of a variety of perceptions of expert process and resource roles for the administrator and consultant. In general the students saw the administrator as more "the expert" than the consultant.—E. M. Bower.

LANGUAGE & COMMUNICATION

1128. Berelson, Bernard. (Columbia U.) The state of communication research. *Publ. Opin. Quart.*, 1959, 23(1), 1-6.—Critical survey of "four major approaches to communication research," and 6 less influential ones, from the past 25 years. Includes as major: "political approach" (Laswell), "sample survey approach" (Lazarsfeld), "small-groups approach" (Lewin), and "experimental approach" (Hovland). The "great ideas . . . of the major figures . . . have to a substantial extent worn out. No new ideas of comparable magnitude have appeared to take their place." One can regret this or "be grateful that the field has a period of time to assimilate, incorporate, and exploit the imaginative innovations of the major figures." Separate commentaries follow by Wilbur Schramm, David Riesman, and Raymond A. Bauer.—E. P. Hollander.

1129. Bergin, Allen Eric. (Stanford U.) Personality "interpretations" as dissonant persuasive communications. *Dissert. Abstr.*, 1961, 21(11), 3520.—*Abstract.*

1130. Bern, Henry A. (Indiana U. Audiovisual Center) Audiovisual "engineers?" *Audiovis. Commun. Rev.*, 1961, 9(4), 186-194.—This article has presented some of the "qualifications" of audiovisual communication to absorb and transmit to the field of education as a whole the impact of the technological revolution of our day. To support the claim of closeness of relationship between audiovisual communication and technology, evidence was offered in relation to (a) suitability of theoretical concepts, (b) orientation of leadership, and (c) research rooted in engineering frameworks. Finally, the hypothesis was offered that the underlying basis for these qualifications is a concern with information and communication theory which audiovisual communication has "absorbed," principally through contact with the field of human engineering.—E. L. Borrowman.

1131. Brosnahan, L. F. The sounds of language. Cambridge, England: Heffer, 1961. vi, 250 p. 25s.—Language, usually studied as a social and cultural phenomenon, is investigated for influences of hereditary factors. Relations between individuals, groups, and populations and the sounds of their speech are examined. Patterns of sound differences and similarities between languages are scrutinized as are sound changes within a language.—E. Y. Beeman.

1132. Cohen, A. M.; Mennic, W. G., & Wolkon, G. H. (Boston U.) The effects of continued practice on the behaviors of problem-solving groups. *Sociometry*, 1961, 24, 416-431.—"This study was concerned with the effects of continued practice on the behaviors of groups trying to solve a relatively large number of problems [60]. 10 groups of 5 men were assigned to 1 of 2 communication networks: a wheel and a circle. Questionnaires were completed measuring answer certainty, satisfaction with job, other

members and task, and perception of leadership. Some of the differences found were (a) wheel groups were more effective in all criteria except satisfaction with job, task and other members; and (b) wheel groups learned faster. Since the groups continued to learn over longer periods than previous studies, short duration studies may lead to erroneous conclusions regarding learning.—H. P. Shelley.

1133. Davison, W. Phillips. (RAND Corp.) On the effects of communication. *Publ. Opin. Quart.*, 1959, 23(3), 343-360.—A view of communication in terms of cause and effect (involving a message sent from its source to its destination) may overlook the recipients' activities, needs, and characteristics, and the way in which communications may improve their relationships with their environment. Data are presented from a study of American foreign affairs officials.—E. P. Hollander.

1134. Durand, Marguerite. La spécificité du phonème application au cas de r/l. [Phonemic specificity: The case of (r) and (l).] *J. Psychol. norm. pathol.*, 1960, 57(4), 405-419.—The consonants (r) and (l) are not differentiated in some languages at all, are etymologically interchangeable in some, and represent 2 or more distinct phonemes in still others. The present analysis finds that the relationship between the 2 consonants varies with the phonemic characteristics of (r).—M. L. Simmel.

1135. Greenberg, Bradley S., & Tannenbaum, Percy H. Communicator performance under cognitive stress. *Journalism Quart.*, 1962, 39(2), 168-178.—The effect on a communicator of information which attacks his beliefs (thus putting him under stress) was studied by exposing one group to attack on a strongly held belief, while another received supportive treatment and a 3rd was not stimulated. Ss who were placed under cognitive stress took longer to communicate, made more errors, and communicated less adequately.—D. E. Meister.

1136. Gregory, John Robert. (U. Illinois) Some psychological aspects of motion picture montage. *Dissert. Abstr.*, 1961, 22(1), 317.—Abstract.

1137. Hartman, Frank K. (Dickinson Coll.) Single and multiple channel communication: A review of research and a proposed model. *Audiovis. Commun. Rev.*, 1961, 9(6), 235-262.—The review is concerned with 3 channels of information presentation—pictorial, auditory verbal, and print—with emphasis on "the effects of these channels when used in combination to present information." (129-item bibliogr.)—E. L. Borrowman.

1138. Jakobovits, Leon A., & Lambert, Wallace E. (McGill U.) Semantic satiation among bilinguals. *J. exp. Psychol.*, 1961, 62(6), 576-582.—"The phenomenon of semantic satiation was related to the mediation theory of compound and coordinate bilingualism. It was predicted that compound bilinguals, having interdependent language systems, will exhibit a cross-linguistic satiation effect (cross-satiation), while coordinate bilinguals, having functionally independent language systems, would not exhibit the cross-satiation effect. The results supported the prediction that the two types of bilinguals would behave differently and showed that compounds clearly exhibit the cross-satiation effect while coordinates react in the opposite manner. Some additional analyses were discussed which have a further bearing upon the dif-

ferences in the language structures of compound and coordinate bilinguals."—J. Arbib.

1139. Jakobovits, Leon A., & Lambert, Wallace E. (McGill U., Canada) Semantic satiation in an addition task. *Canad. J. Psychol.*, 1962, 16(2), 112-119.—S repeated a digit aloud for 15 sec. before adding 2 single-digit numbers presented in sequence. When the repeated digit was the same as one of those added, solution time was greater as predicted. It was assumed that the increased latencies resulted from reductions in the meanings of the mathematical symbols. With practice there was a steady increase in the experimental latencies, while control latencies decreased.—R. S. Davidson.

1140. Kaplan, Bernard. (Clark U.) Radical metaphor, aesthetic, and the origin of language. *Rev. existent. Psychol. Psychiat.*, 1962, 2(1), 75-84.—"Radical metaphorizing," a conception introduced by Ernst Cassirer, refers to the representing of an experience in a medium foreign to that of its original expression. By "esthetic" is meant, in general, expressive or imaginative activity. A number of experimental studies are reviewed which suggest the same finding: that when a physically invariant pattern is taken by S to represent different conceptions, he will "esthetically" structure and restructure the pattern "so that a relationship of 'fittingness' obtains between vehicle and referent."—J. Lyons.

1141. King, William A. (Norair Division, Northrop Corp., Los Angeles) Communication theory and the Allport concept of structure. *Audiovis. Commun. Rev.*, 1961, 9(2), 119-128.—Postulates of the Allport event-structure theory are examined as possible bases for communication theory.—E. L. Borrowman.

1142. Lyle, Jack. (U. California, Los Angeles) Communication, group atmosphere, productivity, and morale in small task groups. *Hum. Relat.*, 1961, 14(4), 369-379.—Journalism students were organized into 24 4-man groups and were presented a news-story writing task to study the relations of communication structure and group atmosphere to group oral communication, morale, and productivity. Democratic groups had a higher rate of talk-irrelevant communication and of task-relevant communication. Democratic groups worked fastest with restricted communication, while authoritarian groups worked fastest with open communication; however, the differences were not significant. The denial of feedback to the editor had the effect of lowering morale in democratic, but not in authoritarian groups. (18 ref.)—W. W. Meissner.

1143. McNelly, John T. Meaning intensity and interest in foreign news topics. *Journalism Quart.*, 1962, 39(2), 161-168.—"This experimental study relates the acquisition of interest in the subject matter of news to the acquisition of meaning for it. Subjects who were exposed to news stories about previously unfamiliar topics acquired interest in the topics along with more intense meanings for them."—D. E. Meister.

1144. Nokes, Peter. Feedback as an explanatory device in the study of certain interpersonal and institutional processes. *Hum. Relat.*, 1961, 14(4), 381-387.—The concept of feedback is discussed in terms of the individual and the management of large institutions. Inadequate feedback to the individual

results in anxiety; and where it is available but ignored, it seems to be accompanied by autistic thinking. Parallels on the level of social institutions are pointed out. The conclusion is drawn that psychiatric concepts can be used to explain malfunctioning in large institutions and vice versa.—*W. W. Meissner.*

1145. Oléron, Geneviève. *Compréhension d'un texte et liaisons entre les mots.* [Comprehension of a text and relations between words.] *Année psychol.*, 1961, 61, 377-395.—The successful reconstruction of a text is the criterion of the comprehension of a significant relation between the words and thus of the comprehension of the ideas in the original text. The more the text is broken up, the more difficult is the reconstruction. Constraint imposed by customary verbal associations plays a role as does the uncertainty created by equivalence of the role which several words can play in relation to one other word when the syntax does not completely determine the choice.—*G. Rubin-Rabson.*

1146. Prutsman, Thomas Damon. (Florida State U.) The efficacy of some commonly used verbal stimuli as a function of the response class with which they are used. *Dissert. Abstr.*, 1961, 21(12), 3864.—*Abstract.*

1147. Resnick, A. (International Business Machines, Yorktown Heights, N. Y.) Relative effectiveness of document titles and abstracts for determining relevance of documents. *Science*, 1961, 134(3484), 1004-1005.—Individuals who received documents through a selective dissemination of information system were asked to determine the relevance of documents to their work interests on the basis of titles and of abstracts. The results indicate that there was no significant difference between the usefulness of titles and of abstracts for this purpose.—*Journal abstract.*

1148. Reznikov, L. O. Neopozitivistskaia gnozeologija i znakovaia teoriia iazyka. [Neopositivistic gnosology and the sign theory of language.] *Vop. Fil.*, 1962, 16(2), 99-109.—The author explores the relationship of "language, thought, and objective reality" and, in particular, the problem of whether language should be viewed as merely a "system of signs." He concludes that the sign theory of language is mistaken, since it rests on a "false gnosological basis." From the point of view of a consistent materialism there is no reconcilability between the view that language is the "direct reality of thought" and the view that language is only a system of signs, for the latter leads to a denial of the "reflection of the object in the meaning of the word" or to the "elimination of meaning from the composition of the word and its reduction to mere sounding."—*I. D. London.*

1149. Richmond, Jo F., & Buehler, Roy E. Interpersonal communication: A theoretical formulation. *J. Commun.*, 1962, 12, 3-10.—"Communication is a transactional process, occurring on all levels of biosocial integration. . . . We have defined communication transactions in terms of process which occur on four major levels: the biochemical, the motor gestural, speech and technology. These communication levels are seen as functionally related to the levels of socio-cultural integration."—*D. E. Meister.*

1150. Rossi-Landi, Ferruccio. (U. Padova, Italy) *Significato, comunicazione e parlare comune.* [Meaning, communication and common speech.]

Padova, Italy: Marsilio, 1961. 291 p. L. 2500.—The author examines certain general conditions that render meaning and communication possible in our common speech habits. Some general theories of a cognitive-speculative type are considered. The book consists of the following chapters: "Material and Method," "Universes of Discourse," "Empiricism and Idealism in the Study of Meaning," "Nature and History of Common Speech," "Common Speech and Scant Significance," "The Methodological Function of Speech," "Separate and Associative Meaning," "The Communicative Situation and the Changing Context," "Communication between Diverse Languages and Various Levels of Discourse," and "Some Conclusive Reflections." Name index and appendix are included.—*N. De Palma.*

1151. Runkel, P. J. (U. Illinois) Replicated tests of the attraction-communication hypothesis in a setting of technical information flow. *Amer. sociol. Rev.*, 1962, 27(3), 402-408.—To test the hypothesis that "degree of respect between individuals is associated with the amount of relevant communication which takes place between them," questionnaires were administered to faculty members from 28 secondary schools to determine which staff members they respected in matters of counseling or testing, and then other questionnaires were given to small groups of the faculty members to ascertain the communication patterns among these people. Analyses of the data showed that the general level of respect was higher among people who had frequent communication with each other on relevant matters (dealing with counseling and testing) than among people who communicated with each other less frequently. Official position in the school did not account for any important part of this relationship.—*L. Berkowita.*

1152. Thomas, E. J., Webb, Susan, & Tweedie, Jean. (U. Michigan) Effects of familiarity with a controversial issue on acceptance of successive persuasive communications. *J. abnorm. soc. Psychol.*, 1961, 63(3), 656-659.—The relationship between primacy and recency of communication and familiarity with the topic were explored. Attitudes were measured of high school students towards an article on a controversial subject written from both a pro and a con standpoint. Attempts to establish primacy and recency effects failed.—*G. Frank.*

1153. Upton, Albert. *Design for thinking: A first course in semantics.* Stanford, Calif.: Stanford Univ. Press, 1961. 240 p. \$5.50.—This book, designed for the college freshman, is "about the part language plays in human life." There are 18 chapters each with a set of study questions. The chapter titles are: "Orientation," "Brain and Mind," "Analysis," "Meaning," "Signs," "Ambiguity," "Semantic Growth," "Metaphor," "Communication," "The Psychology of Qualification," "The Theory of Definition," "The Practice of Definition," "Symbolic Instruments," "Chance," "Problem-Solving," "Exposition," "Language and Adjustment," and "The Noblest Function of Language."—*C. J. Adkins.*

1154. Wason, P. C. The retention of material presented through précis. *J. Commun.*, 1962, 12, 36-43.—The aim of the experiment was to determine whether original written material and a précis of that material differed significantly in respect to accuracy and amount of material recalled. Recall from

originals was significantly superior to that from precís.—*D. E. Meister.*

Speech & Linguistics

1155. Boyer, Ernest L., & Garwood, Victor P. Effects of delayed sidetone and speech content on elapsed reading time. *J. Commun.*, 1962, 12, 44-50.—The influence of affective speech content upon the speech performance of 60 Ss under nondelayed and delayed sidetone conditions was investigated. Pleasant, unpleasant, and neutral sentences were read under nondelay and delay conditions. The length of reading time for both the pleasant and unpleasant sentence groups was significantly longer than that for the neutral sentence group.—*D. E. Meister.*

1156. Chase, Richard Allen, & Guilfoyle, George. (St. Elizabeths Hosp., Washington, D. C.) Effect of simultaneous delayed and undelayed auditory feedback on speech. *J. speech hear. Res.*, 1962, 5(2), 144-151.—15 male adults read 50-word passages under normal conditions, undelayed, and delayed auditory feedback, and 3 conditions of combined delayed and undelayed auditory feedback in which the gain was progressively $\frac{1}{2}$ of, $\frac{2}{3}$ of, and equal to that of the delayed auditory feedback. All combined conditions reduced the amount of disturbance in speech due to delayed auditory feedback alone. The largest proportion of improvement resulted from simultaneous synchronous feedback $\frac{1}{2}$ the gain of the delayed auditory feedback.—*M. F. Palmer.*

1157. Creech, Henry B. (Ohio State U.) Distribution of measures for syllable duration, reading rate. *J. speech hear. Res.*, 1962, 5(1), 29.—A 198-syllable passage was read by 10 students enrolled in a university course in elementary speech and was re-recorded at a controlled speed multiplied by a factor of 2. The E monitored the recording and marked the dictionary syllabication. The frequency distribution of syllable duration did not fit a normal curve. 120 university students, also enrolled in an elementary speech course, read 12 5-syllable phrases of which the last 6 were recorded. The mean syllable duration for each reader was put into a frequency distribution. The results indicate that normal readers may be assumed to be distributed normally in their reading rates.—*M. F. Palmer.*

1158. Frijda, Nico H., & van de Geer, John P. Codability and recognition: An experiment with facial expressions. *Acta psychol., Amsterdam*, 1961, 18, 360-367.—The present experiment in the recognition of facial expressions from photographs supports Whorf's theory of the interdependence of language and cognition, but is ambiguous in respect to his claim concerning causal direction. Influences in both directions might be relevant.—*G. Rubin-Rabson.*

1159. Hecker, Michael H. L. (Massachusetts Inst. Technology) Studies of nasal consonants with an articulatory speech synthesizer. *J. Acoust. Soc. Amer.*, 1962, 34, 179-188.—An electrical analog of the nasal cavities was designed for use in conjunction with a dynamically controllable analog of the vocal tract. The acoustical coupling between vocal tract and nasal cavities is electronically variable. It was found that more natural-sounding syllables are obtained when the velopharyngeal coupling varies slowly with time compared to changes in vocal-tract configuration. The experiments demonstrate that

speech can be synthesized from articulatory information in a straightforward and natural manner.—*A. M. Small, Jr.*

1160. Holbrook, Anthony, & Fairbanks, Grant. (Wayne State U.) Diphthong formants and their movements. *J. speech hear. Res.*, 1962, 5(1), 35-58.—6 diphthongs and 10 vowels were spoken in words by 20 males, all native General American speakers. Variations of frequencies and amplitudes of the lower 3 formants showed the following: The durations of the formants were relatively short in /eI/, /OU/, /ju/, and longer in /aI/, /oI/, and /aU/. Formants One (F_1) and Two (F_2) coincided approximately throughout. F_1 and F_2 frequencies diverged during their course in /eI/, /aI/, and /oI/, but tended to maintain a constant ratio as both lowered during /OU/, and converged during /aU/ and /ju/. The coordinated plots of F_1 and F_2 showed extensive overlap of vowel areas, but these were mutually exclusive when the 10 samples closest to the median were considered.—*M. F. Palmer.*

1161. Moll, Kenneth B. (U. Iowa) Velopharyngeal closure on vowels. *J. speech hear. Res.*, 1962, 5(1), 30-37.—Cinefluorographic pictures were taken of 10 adult Ss, who exhibited no abnormal speech patterns, during the production of 60 CVC (constant, vowel, constant) syllables and 4 isolated, sustained vowel sounds. Low vowels exhibit less velopharyngeal closure than high vowels. Vowels adjacent to the consonant /n/ exhibit incomplete velopharyngeal closure, with vowels preceding the nasal consonant having less closure than those following. There were no significant differences between the effects of non-nasal consonant contexts on vowel closure. There was a tendency for less closure on isolated vowels than on those in non-nasal, consonant contexts.—*M. F. Palmer.*

1162. Peterson, Gordon E., & Lehiste, Ilse. (U. Michigan) Duration of syllable nuclei in English. *J. Acoust. Soc. Amer.*, 1960, 32(6), 693-703.—The influence of preceding and following consonants on the duration of stressed vowels and diphthongs in American English was studied. A set of 1263 CNC words, embedded in the same carrier phrase and pronounced by a single speaker, was analyzed spectrographically. Although the influences of various classes of consonants on the duration of the syllable nucleus was determined, the general results show that the final consonant, but not the initial consonant have a significant effect.—*A. M. Small, Jr.*

1163. Shoup, J. E. (U. Michigan) Phoneme selection for studies in automatic speech recognition. *J. Acoust. Soc. Amer.*, 1962, 34, 397-403.—2 methods for the selection of speech material to be used in studies in automatic speech recognition are suggested. The selection can be based on the high frequency of occurrence of the individual phonemes, on the high yield of words by the phonemes, or on some combination of these 2 criteria. A combination of the 2 criteria appears to be most satisfactory. The phoneme selection was derived from the 500 most frequently occurring words, as given by Thorndike and Lorge. Some consideration was also given to the frequencies of occurrence of the phonemes. The phonemes are presented in cumulative order according to the number of words by which the list is increased as each successive phoneme is added.—*A. M. Small, Jr.*

1164. Spuehler, Henry E. (Purdue U.) **Delayed sidetone and auditory flutter.** *J. speech hear. Res.*, 1962, 5(2), 124-132.—10 male and 10 female Ss reading aloud under conditions of auditory delay and flutter show that normal hearing individuals will react to auditory sidetone presentation and auditory flutter rates by deviations in words per minute, phonation time ratio, and average speech power. Male Ss are less affected by the experimental conditions than female Ss. There are some immediate carryover effects on the speech of the individuals.—*M. F. Palmer.*

1165. Thatcher, James W., & Wang, William S.-Y. (Communication Sciences Lab., Ann Arbor, Mich.) **The measurement of functional load.** *USAF OSR Rep.*, 1962, No. 8. 30 p.—The concept of functional load is traditionally used to quantify "extent of contrast" among a set of phonemes. An attempt is made in this paper to associate with the concept a precise meaning within the framework of communication theory. It is suggested that any definition of functional load which conforms to the traditional usage of the concept must satisfy at least the 5 conditions given in this paper. The definitions of functional load given by Greenberg and Hockett, as well as several other possible definitions, are examined with respect to these conditions. Some empirical consequences of this line of investigation are discussed.—*USAF OSR.*

1166. Vanhuyse, A. **Tweetaligheid.** [Bilingualism.] *Tijdschr. Stud.-Beroepsorient.*, 1961, 8, 97-110.—The concept of bilingualism is analyzed from the linguistic and psychological points of view. Pragmatic, cultural, and scholastic factors are found to be determining. A short review of experiments on the subject and of the techniques used by research workers is given.—*R. Piret.*

Mass Communication

1167. Bauer, Raymond A., & Bauer, Alice H. (Harvard U.) **America, "mass society" and mass media.** *J. soc. Issues*, 1960, 16(3), 3-66.—There undoubtedly is "some determinate relationship between a society and its system of communications," and this relationship must work in both directions. This statement would be agreed upon by almost everyone, but more precise assertions stir up conflicts. Contrasting assumptions about America's mass communication are compared, and a general history of this thinking is presented. Research evidence on the mass media is summarized and the concept of "mass society" re-evaluated.—*E. Y. Beeman.*

1168. Bauer, Raymond A., & Bauer, Alice H. (Harvard U.) **Counter-comment. III.** *J. soc. Issues*, 1960, 16(3), 85-87.—The authors answer Mr. Coser's comments (see 37: 1169) on their article (see 37: 1167).—*E. Y. Beeman.*

1169. Coser, Lewis A. (Brandeis U.) **Comments on Bauer and Bauer. II.** *J. soc. Issues*, 1960, 16(3), 78-84.—Comments on the critique of the critics of mass society by Raymond A. Bauer and Alice H. Bauer (see 37: 1167).—*E. Y. Beeman.*

1170. De Fleur, Melvin L., & Petranoff, Robert M. (Indiana U.) **A televised test of subliminal persuasion.** *Publ. Opin. Quart.*, 1959, 23, 168-180.—Subliminal content was broadcast both in a closed-circuit experiment and over a commercial television

station. In the former, significantly better than chance recognition of 1 of 5 symbols was found. For the latter, persuasive content yielded variable effects depending upon combinations of subliminal and more ordinary persuasive techniques. It was concluded that subliminal messages afford only inefficient communication and are not, in themselves alone, effective as persuasive devices.—*E. P. Hollander.*

1171. Jones, Robert L., & Carter, Roy E., Jr. (U. Minnesota) **Some procedures for estimating "news hole" in content analysis.** *Publ. Opin. Quart.*, 1959, 23(3), 399-403.—"Many content analysts who study daily newspaper material wish to express raw amounts of content as percentages of total news space. . . . The main problem involved in calculating the proportions is that of obtaining an appropriate denominator term without spending exceedingly large amounts of time and money in hand-measuring non-advertising space, or 'news hole.' The numerator term usually is no great problem, inasmuch as the space occupied by the relevant categories ordinarily is obtained during the coding process. This article suggests ways in which the content analyst may reduce the size and drudgery of the news-hole task."—*E. P. Hollander.*

1172. MacLean, Malcolm S., Jr., & Crane, Edgar. (Michigan State U.) **Program preferences: Their implications for the educational broadcaster.** *Audiovis. Commun. Rev.*, 1961, 9(2), 85-98.—Samples of adults watched and evaluated "a wide variety of National Educational Television programs. Program content evaluations were correlated and factor-analyzed." The results suggested that 5 types of content held appeal: arts, public affairs, self-improvement, science, and tradition.—*E. L. Borrowman.*

1173. McNelly, John Taylor. (Michigan State U.) **Meaning intensity as related to readership of foreign news.** *Dissert. Abstr.*, 1961, 22(1), 347-348.—*Abstract.*

1174. Parsons, Talcott, & White, Winston. (Harvard U.) **Commentary I: The mass media and the structure of American society.** *J. soc. Issues*, 1960, 16(3), 67-77.—Structural changes have been occurring in the field of communications that are analytically similar to changes in the economic and political systems. Accessibility to cultural content is being extended to ever-widening groups. The media of communication are being more and more differentiated and specialized. The increase of functional capacity seems to be resulting in a qualitative upgrading of offerings.—*E. Y. Beeman.*

1175. Pearlin, Leonard I. (National Inst. Mental Health) **Social and personal stress and escape television viewing.** *Publ. Opin. Quart.*, 1959, 23(2), 255-259.—From interviews conducted with 736 television owners in a southern industrial city, a relationship was found between stressful experience, e.g., "aspirations frustrated," "guardedness," and viewing television for a reported means of escape. "It could be questioned whether escape viewing is perhaps more dysfunctional than functional. The very term escape suggests that one does not face squarely his difficulties. . . . It is worthwhile to entertain the possibility, though, that the mass media, while they might have long-run dysfunctions, provide a day-to-day 'safety valve' function by diverting their audiences from an awareness of the stresses under which they might live."—*E. P. Hollander.*

1176. Pool, Ithiel de Sola, & Shulman, Irwin. (Massachusetts Inst. Technology) *Newsmen's fantasies, audiences, and newswriting. Publ. Opin. Quart.*, 1959, 23(2), 145-158.—An interview study revealed that the journalist is influenced in what he writes by "the affective relationship that he conceived to exist between himself and his imaginary interlocutors . . . who may also be described as reference persons." In a subsequent experiment, 132 journalism students were given 1 of 4 sets of facts to write a story, and then completed a questionnaire to elicit imagery. 3 propositions were confirmed: (a) "good news" gave images of supportive persons, "bad news" of critics; (b) images congruent with kind of news were associated with accurate reporting; and (c) "good news" was more accurately reported than "bad."—E. P. Hollander.

1177. Ruesch, Jurgen. (U. California School Medicine, San Francisco) *Human communication and the psychiatrist. Amer. J. Psychiat.*, 1962, 118(10), 881-888.—The social and psychological changes that mass communication has wrought are first discussed, after which the role of communication in mental disease is presented.—N. H. Pronko.

ESTHETICS

1178. Cohen, Joel E. (Harvard U.) *Information theory and music. Behav. Sci.*, 1962, 7(2), 137-163.—This paper explicates some of the assumptions made in previous applications of information theory to music, surveys the results obtained on the basis of these assumptions, and criticizes these results and assumptions in order to indicate some necessary modifications and possible new areas of research. (64 ref.)—J. Arbib.

1179. Ekman, G., & Künnapas, T. *Measurement of aesthetic value by "direct" and "indirect" methods. Scand. J. Psychol.*, 1962, 3(1), 33-39.—The main features of "direct" and "indirect" methods for psychophysical measurement are briefly reviewed. An experiment is described in which the esthetic value of 18 specimens of handwriting was measured by the direct method of ratio estimation and the indirect method of pair comparisons on the assumption of Thurstone's Case V. The scale constructed by the indirect method was a theoretically expected logarithmic function of the ratio scale obtained by the direct method. If the ratio scale is accepted as a criterion, the results show that a true interval scale may be constructed by the indirect method in this experiment, provided that the assumption of constant variability is replaced by an assumption of proportional variability.—*Journal abstract.*

1180. Fransworth, P. R. *Musicality and abnormality. Confin. psychiat., Basel*, 1961, 4(3/4), 158-164.—A review of the research on the personality characteristics of musicians refutes the popular notion that artistic activity is associated with abnormality. The occasional judgment of artists' femininity is linked with the particular characteristics of American social sex role norms.—E. W. Eng.

1181. Guillot, Marcel. *Sur certaines possibilités psychophysiologiques et physiques d'une technique nouvelle de division des couleurs en peinture. [A new technique of color classification in painting.] J. Psychol. norm. pathol.*, 1961, 58(1), 11-32.—A discussion of the laws of pigment mixtures, light mixtures, and simultaneous contrast, with special emphasis

on the case of mixtures of Prussian blue and yellow ochre.—M. L. Simmel.

1182. Hungerland, Helmut. (Ed.) (Piedmont, Calif.) *Selective current bibliography for aesthetics and related fields: January 1, 1961-December 31, 1961. J. Aesthet. art Crit.*, 1962, 20, 475-491.—Includes a section on psychology.—P. R. Farnsworth.

1183. Meyer, Max F. *Helmholtz's aversion to tempered tuning experimentally shown to be a neurological problem. J. Acoust. Soc. Amer.*, 1962, 34, 127-128.—"Experiments show that the brain of people of ordinary musical endowment, when unsophisticated, enables them to esthetically appreciate melodies that are even more mistuned than the equally tempered scale."—A. M. Small, Jr.

1184. Moulin, Raymonde. *Le marchand de tableaux. [The art dealer] J. Psychol. norm. pathol.*, 1961, 58(3), 309-330.—A study of the cultural role of the art dealer, his relationship with living artists, his motivation underlying the choice of occupation, etc., based on personal interviews with 60 art dealers in Paris.—M. L. Simmel.

PERSONALITY & ABILITIES

1185. Dreger, Ralph Mason. (Jacksonville U.) *Fundamentals of personality: A functional psychology of personality. Philadelphia, Pa.: Lippincott*, 1962. xi, 388 p. \$6.95.—Social, clinical, and experimental approaches to "all major and most minor theories" are brought to bear on the normal adult personality. A concise, systematic treatment of the entire area is offered, with a brief appendix entitled "Dimensions and Factor Analysis." (43-p. bibliogr.)—R. Tyson.

1186. Flyer, Eli S., & Carp, Frances M. (Lackland AFB, Tex.) *The Picture Test: Rationale and one validation of the method. J. appl. Psychol.*, 1962, 46, 226-227.—A procedure has been designed that capitalizes on halo variance in ratings. To test the hypothesis of affective transfer from picture material to response categories, over 300 Ss were tested with one format of the Picture Test, obtaining, indirectly, their attitudes towards 8 religious groupings. Objective scoring of responses to the religious categories was accomplished, and Ss were grouped by their stated religious affiliation. Distributions of responses to the religious categories were consistent and supportive of the test's rationale—that affective transfer from picture material to response categories can occur with the method, and that responses can be meaningfully related to known group characteristics.—*Journal abstract.*

1187. Gaito, J. (Kansas State U.) *Forced and free Q sorts. Psychol. Rep.*, 1962, 10(1), 251-254.—"Statistical and non-statistical aspects of Q sorting are considered. Severe defects appear present for various analysis tests of significance when forced sorting is involved; moderate distortion, when free sort is used. Forced sort procedures may also destroy the subject matter of interest by affecting Ss' spontaneity, force moderation in attitude, affect card counting, and adversely influence S's motivation."—B. J. House.

1188. Sarason, Irwin G. (Ed.) *Contemporary research in personality. Princeton, N. J.: Van*

Nostrand, 1962. xii, 411 p.—A collection of 30 readings in personality research. The articles, by 65 authors, are divided in 9 sections: "Paper and Pencil Measures of Personality"; "Personality Measures Based on Subject's Fantasy"; "Personality Assessment"; "Personality and Development"; "Social, Cultural, and Personality Measures"; "Perception, the Self, and Personality"; "Learning, Stress, and Performance"; "Deviant Behavior and its Treatment"; and "The Case Study."—*E. L. Borrowman.*

1189. **Vernon, Philip E.** *The Measurement of abilities.* (2nd ed.) New York: Philosophical Library, 1961. xii, 276 p. \$7.50.—In this revision of a book originally published in 1939, the 1st 8 chapters are devoted to a presentation of elementary statistics as applied to tests and measurements. The rest of the book discusses new-type (objective) tests, essay examinations, test construction, and hints to testers. It contains a comprehensive list of published mental tests available in Great Britain together with CA or MA range, time, publisher, and price. This list is divided into attainment, achievement, and educational tests, individual intelligence tests, group intelligence tests, aptitude and special ability tests, and personality tests and assessments. Although projective techniques are included here, the Rorschach is noticeably missing.—*R. E. Perl.*

NEW TESTS & TEST CONSTRUCTION

1190. **Angoff, William H.** (Educational Testing Service) *Scales with nonmeaningful origins and units of measurement.* *Educ. psychol. Measmt.*, 1962, 22(1), 27-34.—The reasons usually given for preferring derived score scales for standardized tests include: (a) convenience in handling test score data, (b) comparability in different regions of the scale, (c) comparability of different forms, and (d) incorporating normative meaning. The author does not consider (d) essential because changes occur in score distributions with the passage of time. These changes are illustrated with the Army Alpha and the SAT of the College Board Program.—*W. Coleman.*

1191. **Bricklin, Barry; Piotrowski, Zygmunt A., & Wagner, Edwin E.** (Jefferson Medical Coll., Philadelphia) *The hand test.* Springfield, Ill.: Charles C Thomas, 1962. x, 100 p. \$5.00.—"This test consists of pictures of human hands in various ambiguous poses. The S is asked to tell what each hand may be doing. Administration and scoring require only about 12 minutes. Described are the results obtained from administration of the test in a wide variety of Ss: prison inmates, paroled recidivist and nonrecidivist offenders, acting-out psychiatric patients, non-acting-out psychiatric patients, passive indigents, schizophrenics, psychoneurotics, cases suffering intracranial lesions, epileptics, normals, children with reading problems, and children's control group. A large section is devoted to use of the test in daily clinical practice including diagnostic hints and procedures pertaining to use of the test with the individual case." The test was particularly devised for measuring aggressive acting out tendencies versus tendencies associated with social cooperation. To test the validity of the acting out score, the method of "known groups" was used.—*N. De Palma.*

1192. **Crites, John O., Bechtoldt, Harold P., Goodstein, Leonard D., & Heilbrun, Alfred B., Jr.**

(U. Iowa) *A factor analysis of the California Psychological Inventory.* *J. appl. Psychol.*, 1961, 45(6), 408-414.—Using test scores from 372 Ss, various statistical analyses indicated that a reduced set of 6 scales accounts for about $\frac{2}{3}$ of the total variance in the CPI. "... the reference scales provide more concise and less ambiguous definitions of the variables assessed by the CPI and have considerable promise as measures of the normal personality."—*J. W. Russell.*

1193. **Curtis, H. A., & Kropp, R. P.** (Florida State U.) *Standard and visual administrations of the Concept Mastery Test.* *Audiovis. Commun. Rev.*, 1962, 10(1), 38-42.—Comparisons of the test administered conventionally and by television under various speeded conditions indicate that the projected test "can be speeded greatly without appreciably altering test reliability and validity." Separate norms would be required.—*R. E. Schultz.*

1194. **Ebel, Robert L.** (Educational Testing Service) *Content standard test scores.* *Educ. psychol. Measmt.*, 1962, 22(1), 15-25.—A content standard test score is "a number that indicates the per cent of a systematic sample from a defined domain of tasks which an individual has performed successfully." Although normative standard scores are currently the most popular, to be meaningful test scores they must be related to test content as well as to the scores of other examinees. 2 ways of securing test scores having content meaning are described: (a) use of "scale books" of selected items, and (b) build "the meaning into the test, and hence into the test score, by systematic, explicitly specified processes of test construction." Examples of the use of both methods are provided.—*W. Coleman.*

1195. **Flanagan, John C.** (American Inst. Research) *Discussion.* *Educ. psychol. Measmt.*, 1962, 22(1), 35-39.—With the exception of the requirement that the items in a test form a Guttman Scale, Flanagan agrees with Gardner's position. He does not agree with Angoff though he respects his points as deserving serious consideration. In support of Ebel's "content standard test score," Flanagan cites Robert Seashore's Vocabulary Test, some of his prior recommendations, and work done in Project TALENT to provide for interpretation of scores.—*W. Coleman.*

1196. **Gardner, Eric F.** (Syracuse U.) *Normative standard scores.* *Educ. psychol. Measmt.*, 1962, 22(1), 7-14.—5 desirable properties of test items were discussed: (a) they constitute a representative sample of the domain tested, (b) they form a Guttman Scale, (c) they are arranged along a continuum of the variable under consideration in such a way that the raw scores constitute an interval scale, (d) they are of such a nature that a zero score on the test represents a zero amount of the ability being tested; and (e) they provide a scale unit which is meaningful. The sampling of examinees was also considered. Norms based on a variety of different groups, with the groups well-defined, were recommended. Different types of norms such as grade scores, percentile scores, and standard scores were all said to have their place.—*W. Coleman.*

1197. **Katzell, Raymond A., & Katzell, Mildred E.** (New York U.) *Development and application of structured tests of personality.* *Rev. educ. Res.*,

1962, 32(1), 51-63.—Several hundred books, monographs, and articles have been published during the past 3 years describing the development, application, validity, reliability, and norms of various structured measures of personality. This review was organized according to the particular test studied: Minnesota Multiphasic Personality Inventory, Edwards Personal Preference Schedule, anxiety scales, other personality inventories, and interest and attitude inventories. A brief report on new tests, response sets and distortion, and trends and needs in the field followed. (70 ref.)—*F. Goldsmith.*

1198. Loomba, Ram Murti. (Lucknow, India) **A new type of sentence completion technique and its use in the investigation of a person's self-concept.** *Indian J. Psychol.*, 1961, 36(3), 133-148.—A form of sentence-completion test is described which begins each sentence with a simple, first person pronoun; some of the pronouns being repeated for later sentences. The rationale and advantages of this technique are given, together with results from a preliminary try-out.—*J. T. Cowles.*

1199. Muthayya, B. C. (Sri Venkateswara U. Tirupathi) **The Madras Picture-Frustration Test (MP-F) and its development.** *MANAS, Delhi*, 1961, 8, 29-35.—The test, meant for the 13+–17+ age group, consists of 15 cartoon-like drawings showing everyday frustrating situations. Interrater reliability ranges from 42% to 89%. Matrix reliability (stability) coefficients of the scoring factors range from 36% to 70%. Identity of the responses of the test-retest protocols showed an agreement ranging from 50% to 75%. Tentative validity has been established by pre- and postexperimental frustration comparison, trend analysis, and comparison of delinquent and normal groups.—*U. Pareek.*

1200. Sen, Myra. **A new method of scoring of Haufmann-Kasanin Test.** *MANAS, Delhi*, 1961, 8, 21-27.—New elements introduced in administration and scoring of the test are time limit (25 minutes) and quantitative scoring. Credits ranging from 0 to 5 are given to different degrees of rigidity. Fluidity has been treated from 2 angles: incomplete attempt and arbitrary attempt. "The scores of these two varieties are found from the ratio of each of these two attempts to the total number of attempts."—*U. Pareek.*

1201. Sinha, Durganand. (Indian Inst. Technology, Kharagpur) **Development of two anxiety scales.** *MANAS, Delhi*, 1961, 8, 1-10.—These scales are being developed on a sample of Indian college students. The W-A Self-Analysis Form has 140 items of the "yes-no" type indicating anxiety situations and reactions. The scale has high correlation with the Taylor MA scale.—*U. Pareek.*

TEST STANDARDIZATION & EVALUATION

1202. Field, J. G. **An interpersonal validation of the MPI.** *Acta psychol., Amsterdam*, 1961, 18 (5), 351-353.—Judges selected their own personality doubles—accurately, according to the Maudsley Personality Inventory Neuroticism scale; insignificantly, according to the Extraversion scale in which the best judges were not better than others.—*G. Rubin-Rabson.*

1203. Guertin, Wilson H., Rabin, Albert I., Frank, George H., & Ladd, Clayton E. (U.

Florida) **Research with the Wechsler Intelligence Scales for Adults: 1955-60.** *Psychol. Bull.*, 1962, 59(1), 1-26.—The WAIS, as a measure of intelligence, is a marked improvement over its predecessor. Variables such as sex, age, and numerous environmental factors have been shown to affect scores. As a diagnostic aid, the WAIS remains as questionable as the earlier forms. Research in the latter area has been generally inadequate, a major problem being the lack of an adequate theoretical framework.—*W. J. Meyer.*

1204. Jordan, T. E. (Saint Louis U.) **Normative data on the progressive matrices (1938).** *Psychol. Rep.*, 1962, 10(1), 122.—Percentiles and raw scores on the Progressive Matrices (1938) intelligence scale are presented for a random sample ($N=365$) of an entering freshman class.—*B. J. House.*

1205. Morán, Roberto E. (U. Puerto Rico) **Observations and recommendations on the Puerto Rican version of the Wechsler Intelligence Scale for Children.** *Pedagogia, Rio Piedras*, 1962, 10, 89-98.—The WISC was translated and adapted to Puerto Rican Spanish, and norms were established from the results of a representative sample of Puerto Rican school children. The mean Puerto Rican IQ was 88, SD 22, as compared with the mean of 100, SD 15, on the original version. It had been suggested that a Puerto Rican child with a WISC IQ of 88 would be comparable to an American child with an IQ of 100, and would be considered of average intelligence. The dangers of such an assumption are pointed out, and it is suggested that Puerto Rican WISC IQs be converted to their American equivalents by using the formula $X = M_2 - \sigma_2(M_1 - Y/\sigma_1)$. An explanation of this formula and a conversion table of Puerto Rican IQs to American ones are presented.—*R. E. Morán.*

1206. Muthayya, B. C. **An experimental validation of the Madras Picture-Frustration Study.** *Psychol. Stud., Mysore*, 1962, 7, 10-15.—The test was validated with experimentally produced frustration. No significant differences were found in the frustration reactions between pre- and postexperimental frustration testings.—*U. Pareek.*

1207. O'Connell, Walter E. (VA Hosp., Waco, Tex.) **Item analysis of the WHAT test.** *J. soc. Psychol.*, 1962, 56, 271-276.—This paper reports an analysis of the Wit and Humor Appreciation Test (WHAT). The test is comprised of 30 joke items—10 each following the Freudian paradigms of humor, hostile wit, and nonsense wit. In an earlier study by this investigator, a significant sex difference was discovered with college undergraduates in their preferences for hostile wit and nonsense wit. Women preferred nonsense wit while men favored hostile wit. An item analysis between the sexes for each joke was conducted in an attempt to find other dimensions of jests more specific than the gross categories of humor, hostile wit, and nonsense wit. The 10 items involving hostile wit were examined for sex differences in terms of the subtlety and object of the hostility. Nonsense jokes were classified into puns and retorts, with the assumption that females would prefer the former while men would appreciate the latter. Results of the chi square tests on 330 males and females confirmed the view that within the various gross categories, sex differences in appreciation de-

pend to a large extent upon the amount of hostility expressed in the jest.—*Author abstract.*

1208. **Riddell, S. A.** (Banstead Hosp., Sutton, Surrey) **The performance of elderly psychiatric patients on equivalent forms of tests of memory and learning.** *Brit. J. soc. clin. Psychol.*, 1962, 1(1), 70-71.—2 parallel forms of the Benton Revised Visual Retention Test and of the Inglis Auditory Recall Test (see 34: 4037) were given at intervals of one week between forms to small groups (15 or less) of elderly females. Doubt was thrown upon the equivalence of the 2 forms.—*C. M. Franks.*

INTELLIGENCE & CREATIVITY

1209. **Andrews, Michael F. (Ed.)** (Syracuse U.) **Creativity and psychological health.** Syracuse, N. Y.: Syracuse Univer. Press, 1961. x, 148 p. \$2.25.—Symposia proceedings from the 1960-61 Conferences on Creative Arts Education held at Syracuse University. Contributors included a psychologist, a philosopher, a sociologist, a medical doctor, a textbook publisher, an educational researcher, an art educator, and a specialist in the field of exceptional education. Contributors conceive creativity to be a "positive self-integrating force . . . a process of self-actualization, an expression of being." They present their interpretations of the relationships between creativity and psychological health.—*C. H. Miley.*

1210. **Bradway, Katherine P., & Thompson, Clare W.** (Stanford U.) **Intelligence at adulthood: A twenty-five year follow-up.** *J. educ. Psychol.*, 1962, 53, 1-14.—This paper reports findings from 111 Ss tested with the Stanford-Binet (S-B) at preschool and adolescence who were administered the S-B and WAIS at adulthood. Correlations of preschool IQs with adult S-B and full WAIS IQs are .59 and .64; of adolescent IQs with adult IQs, .85 and .80. Mean S-B IQ increase from adolescence to adulthood is 11 points, indicating that mental growth continues beyond 16 years. Males show more IQ gain after adolescence than do females ($p < .01$). Girls with high IQs increase least. Analysis of increases in percent passing S-B items shows more growth after adolescence in abstract reasoning and vocabulary than in rote memory and practical reasoning. Preschool verbal and memory items are better predictors than nonverbal items of both verbal and performance adult IQs. Pattern of individual differences in relative amounts of these abilities shows some stability over 25 years.—*Journal abstract.*

1211. **Buel, William D., & Bachner, Virginia M.** (Science Research Associates, Chicago) **The assessment of creativity in a research setting.** *J. appl. Psychol.*, 1961, 45(6), 353-358.—Psychometric instruments of varying nature were used to evaluate research personnel in a major cereal and feed company research center. 3 criteria of creativity were collected against which the psychometric instrument validities were calculated. Certain intelligence, interest, and personality variables and the forced-choice instrument were demonstrated to be valid, singly and in combination, for differentiating between relatively creative and noncreative research workers.—*Author abstract.*

1212. **Canisia, M.** (Loyola U.) **Mathematical ability as related to reasoning and use of symbols.**

Educ. psychol. Measmt., 1962, 22(1), 105-127.—A battery of 36 tests was assembled, 10 of which were standardized tests. The tests were completed by 150 11th-grade girls in a private secondary school. The 12 centroid factors extracted were discussed and illustrated. 4 2nd-order factors were extracted by the multiple-group method. "The finding of this study suggest that mathematical thought processes appear to be mainly processes of education, organization, and manipulation of relations. Mathematical thinking seems to be characterized by a fluency and flexibility of thought-material under restricting conditions such as are often imposed by the assumptions, postulates, and definitions of a mathematical problem. The number factor appears to be quite unrelated to the other factors in terms of which mathematical ability was described in this study."—*W. Coleman.*

1213. **Cohen, Irwin H.** (Michigan State U.) **Adaptive regression, dogmatism, and creativity.** *Dissert. Abstr.*, 1961, 21(11), 3522-3523.—*Abstract.*

1214. **Goodenough, D. R., & Karp, S. A.** (State U. New York Downstate Medical Center) **Field dependence and intellectual functioning.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 241-246.—"The present study was designed to test the hypotheses that some intellectual and perceptual tasks have a common requirement for overcoming embedded contexts, and that relationships obtained between measures of field dependence and standard tests of intelligence are based on this common factor. Two factor analyses were conducted on matrices of correlations between cognitive tests, including tests of field dependence and the subtests of the WISC. The results tend to support both hypotheses."—*G. Frank.*

1215. **Gordon, William J. J.** **Synectics: The development of creative capacity.** New York: Harper, 1961. xi, 180 p. \$4.50.—"Synectics theory applies to the integration of diverse individuals into a problem-solving group. It is an operational theory for the conscious use of the pre-conscious psychological mechanisms present in man's creative activity." Case histories illustrating the use of Synectics' operational mechanisms are provided, together with detailed procedures for organizing and operating Synectics groups in industrial contexts. The author's interest in the nature of creative activity culminates in analyses of metaphor and play and their roles in the creative process. (15-p. bibliogr.)—*W. R. Reitman.*

1216. **Isaacs, Ann F.** (Gifted Child Quarterly, Cincinnati, O.) **Sources of motivation in creatively gifted adults.** *Gifted Child Quart.*, 1961, 5, 63-64.—Parents, teachers, and classmates were of greatest influence to the group of artists, authors, and composers interviewed. Insight came at different ages: for the artists between 5 and 22, for the musicians between 4 and 23, and for the writers between 12 and 40. The war, school papers, and merit awards were forces which shaped their destinies. Some obstacles met were time limitations for creativity, insufficient pay, and rejection by the public.—*N. M. Chansky.*

1217. **Ripple, R. E., & May, F. B.** (Cornell U.) **Caution in comparing creativity and IQ.** *Psychol. Rep.*, 1962, 10(1), 229-230.—"By correlating Otis IQs and scores on creative-thinking tests by members of several seventh grade groups, homogeneous or

heterogeneous with respect to IQ, it was demonstrated that the low correlation of these measures reported by other investigators may well be due in part to the restricted IQ ranges in their samples."—*B. J. House.*

1218. Taylor, Calvin W., & Holland, John L. (U. Utah) Development and application of tests of creativity. *Rev. educ. Res.*, 1962, 32(1), 91-102.—Until a few years ago, the complexities of creativity discouraged research studies in this area. Recently, increased research activities in creativity, in which the Ss have most often been scientists, have been exploratory in nature. Many of the researchers have focused on understanding the nature of creativity and of the creative person, rather than hurriedly trying to build a creativity test to market for widespread use. Much of the research reported was directed toward finding concomitant characteristics of creativity that would eventually permit building tests of creativity potential. (44 ref.)—*F. Goldsmith.*

1219. Wallen, Norman E. (U. Utah) Development and application of tests of general mental ability. *Rev. educ. Res.*, 1962, 32(1), 15-24.—During the period reviewed, the largest number of studies pertained to predictive validity and analysis of test intercorrelations. Of the persistent issues, only a few associated with measures of general ability appeared to be reaching the stage where a fairly definite answer would be possible. From a practical standpoint, the most important occurrence during the review was probably the revision of the Stanford-Binet Scale, described by Terman and Merrill (1960). The manual is somewhat lacking in clarity. Wallen would like to see the balance of research shift from interest correlation and simple predictive validity to refinement of tests based on correlations with more useful outside criteria. (62 ref.)—*F. Goldsmith.*

PERSONALITY MEASUREMENT

1220. Baer, Daniel Joseph. (Fordham U.) A factor analytic study of perceptual and personality rigidity tests. *Dissert. Abstr.*, 1961, 21(12), 3841-3842.—*Abstract.*

1221. Cattell, R. B., Knapp, R. R., & Scheier, I. H. (U. Illinois) Second-order personality factor structure in the objective test realm. *J. consult. Psychol.*, 1961, 25(4), 345-352.—7 2nd-order factors (factors based on correlations between 1st-order factors) independently obtained from 5 separate studies are indexed and named. (a) Tied Socialization; (b) Expansive Ego; (c) Temperamental Arousal; (d) Educated Self-Consciousness; (e) History of Inhibiting, Restraining Environment; (f) Narcissistic Development; (g) Tension to Achieve. Evidence of patterns, their matching, and some criterion associations are presented.—*E. R. Oetting.*

1222. Cerbus, George. (Purdue U.) Personality correlates of picture preferences. *Dissert. Abstr.*, 1961, 22(1), 319-320.—*Abstract.*

1223. Cooper, Allan, & Cowen, Emory L. (U. Rochester) The social desirability of trait descriptive terms: A study of feeling reactions to adjective descriptions. *J. soc. Psychol.*, 1962, 56, 207-215.—The present research was concerned with the reactions of Ss, under a "feeling" frame of reference, to a series of 209 trait descriptive adjectives. The adjectives were identical to those employed in 2 prior

investigations using social and personal frames of reference to establish item social-desirability. 46 college students, comparable in background and education to the 2 earlier samples, served as Ss in the current study. Consistent with the previous findings, female Ss under the feeling set used more extreme ratings than males. The cross set intercorrelations were all in the high 90s, indicating a marked consistency in the relative ordering of the concepts. The feeling set was found to produce more extreme mean ratings than did either the social or the personal set. This finding was interpreted in terms of a hypothesis that the feeling set is more ego-involving and response-mobilizing than the other sets. Also, the greater variability of the Ss under the feeling set suggested that it forces a higher proportion of Ss to place positive or negative values on the trait descriptive adjectives.—*Author abstract.*

1224. Decker, Robert Jay. (Temple U.) The psychogrammatical Homograph Test: An investigation of certain aspects of grammatical usage in relation to certain aspects of personality. *Dissert. Abstr.*, 1961, 22(1), 320-321.—*Abstract.*

1225. Eagle, Morris. (New York U.) Personality correlates of sensitivity to subliminal stimulation. *J. nerv. ment. Dis.*, 1962, 134(1), 1-17.—Individual differences in subliminal sensitivity and their personality correlates were studied as part of a broader program designed to throw light on the processes involved in the effects of subliminal stimuli on cognition. Results showed that Ss sensitive to subliminal stimuli were different in consistent ways from insensitive Ss.—*N. H. Pronko.*

1226. Edwards, Allen L., Diers, Carol J., & Walker, Jerald N. (U. Washington) Response sets and factor loadings on sixty-one personality scales. *J. appl. Psychol.*, 1962, 46, 220-225.—Intercorrelations between 58 MMPI and 3 other personality scales, based upon the scores of 151 students, were factor analyzed and the factors rotated orthogonally. Loadings of the scales on the 1st factor correlated .90 with the proportion of items keyed for socially desirable responses and .98 with the zero-order correlations of the scales with the Social Desirability (SD) scale. The proportion of keyed True items correlated .82 with the loadings of the scales on the 2nd factor. The Lie and 3 other scales similar to the Lie scale had substantial loadings on the 3rd factor. The 1st factor is interpreted as reflecting the tendency to acquiesce, and the 3rd as reflecting the tendency to falsify answers.—*Journal abstract.*

1227. Elliott, Rogers. (U. Illinois) Interrelationships among measures of field dependence ability, and personality traits. *Dissert. Abstr.*, 1961, 21(10), 3163.—*Abstract.*

1228. Eson, Morris E., & Greenfield, Norman. (State U. New York Coll. Teachers, Albany) Life space: Its content and temporal dimensions. *J. genet. Psychol.*, 1962, 100, 113-128.—140 Ss, divided into 7 age-sex groups, completed an interview form which required each S to list his thoughts and conversations of the past week or 2; rate each item on a 3-point scale as to its importance; characterize each item as to feeling tone; and label each item either distant past, near past, near future, or distant future. All 7 groups were consistent in placing great emphasis on the future and on pleasant feeling tone in labeling the items. Older males (60-69 yr.) could

not be differentiated with respect to a greater emphasis on the past, or a less hopeful expectancy of the future. The Ss gave little attention to broad aspects of community life and to problems of morals, ethics, and religion. Implications for the use of the interview form as a diagnostic tool were discussed.—*Author abstract.*

1229. Foulds, G. A. Personality traits and neurotic symptoms and signs. *Brit. J. med. Psychol.*, 1961, 34, 263-270.—"Within any agreed frame of reference personality variables must be regarded as universal. A personality trait is taken to be a relatively consistent and enduring position in respect to a personality variable. Symptoms and signs of mental illness are distinguishable from traits in that they are neither universal nor necessarily enduring." Clinicians may often fail to discriminate among these concepts. Certain tests relate to symptoms and signs, while others relate to traits. Data are reported.—*C. L. Winder.*

1230. Glatzer, A. N., & Reece, M. M. Tactility and sexual symbolism. *Percept. mot. Skills*, 1962, 14, 302.—A spherical object and a straight object, both of rubber, were duplicated in wood. 30 students felt, but did not see them, and rated them on Reece's masculinity-femininity semantic differential. Analysis of variance showed the importance of the hard-soft dimension for the concepts of masculinity and femininity.—*W. H. Guertin.*

1231. Lichtenstein, E., Quinn, R., & Hover, G. L. (U. Michigan) Dogmatism and acquiescent response set. *J. abnorm. soc. Psychol.*, 1961, 63(3), 636-638.—"This study was designed to test the hypothesis that Rokeach's Dogmatism Scale [1960], structurally identical to the F scale, is similarly vulnerable to acquiescent response bias." Administration of acquiescent response scales, the F Scale, and the Dogmatism scale to a population of adult neurotics revealed a high intercorrelation, which supports the hypothesis.—*G. Frank.*

1232. Littig, L. W. (U. Buffalo) An empirical relationship between n affiliation and the F scale. *Psychol. Rep.*, 1962, 10(1), 182.—An intermediate n affiliation group scored significantly higher on the F scale than combined high and low groups, indicating a curvilinear relationship between the 2 measures.—*B. J. House.*

1233. Lynn, R. (U. Exeter, England) Introversion-extraversion differences in judgments of time. *J. abnorm. soc. Psychol.*, 1961, 63(2), 457-458.—The differential capacity of introverts (I) and extroverts (E) to make judgments about times was assessed by using college students distinguished on the basis of the Maudsley Personality Inventory (Eysenck, 1959). To some extent, previous findings regarding the differences of Is and Es to make time estimates were reproduced. Evidence was also presented supporting Eysenck's (1957) hypothesis that Es manifest a greater degree of reactive inhibition and dissipate it more slowly than Is. The major contribution was the use of a unique method of assessing judgments of time (Llewellyn-Thomas, 1959).—*G. Frank.*

1234. McClenahan, Mary Louise Phelps. (State U. Iowa) The relationship of test-defined needs to illuminance matches of need-related pictures. *Dissert. Abstr.*, 1961, 21(12), 3862-3863.—*Abstract.*

1235. Miller, Sutherland, Jr. (Columbia U.) The relationship of personality to occupation, setting and function. *Dissert. Abstr.*, 1961, 21(11), 3518.—*Abstract.*

1236. Monro, A. B. (Long Grove Hosp., Epsom, Surrey, England) The self-referent attitudes of neurotic and inadequate personalities. *J. ment. Sci.*, 1962, 108, 37-46.—For a sample of 150 non-psychotic, hospitalized patients, of whom 125 were neurotics and 25 inadequate personalities, a list of 32 traits referring to attitudes towards one's self was constructed and the patients rated on it; inter-correlations resulted in 22 correlation clusters, each trait correlating with every other trait in the cluster to the extent of .5. These then formed 2 nuclei, one of which seemed to be uncritical acceptance of undervaluation of the self; the other appeared to be rejection of undervaluation.—*W. L. Wilkins.*

1237. Muthayya, B. C. (Thirupathi, India) Relationship between level of aspiration, performance and future performance. *Psychol. Stud., Mysore*, 1961, 6(1), 41-46.—3 performance and 3 verbal tests were used with 252 adolescents for the experiment. A significant relationship was found between performance and aspiration. It was found that "the past performance determines the height of the succeeding aspiration level."—*U. Pareek.*

1238. Nicks, Delmer C., & Fleishman, Edwin A. (Yale U.) What do physical fitness tests measure? A review of factor analytic studies. *Educ. psychol. Measmt.*, 1962, 22(1), 77-95.—14 factors of physical proficiency are described as identified from previous research. Additional possible factors are also described. Physical proficiency is a multidimensional problem. Studies comparing American youth with youth of other countries have assessed only a small number of factors. Large scale studies are planned to clarify the structure of physical proficiency, to clarify some of the factor definitions, and to identify new factors. A battery of basic reference tests might be developed eventually, but for the present a battery of possible tests is described.—*W. Coleman.*

1239. Nooney, James B., & Polansky, Norman A. (Western Reserve U.) The influence of perceived similarity and personality on verbal accessibility. *Merrill-Palmer Quart.*, 1962, 8(1), 33-40.—Whether or not greater perceived similarity as measured by Fiedler's Assumed Similarities technique leads to more verbal accessibility depends on the personality of the S. In an experimental condition where similarity could be inferred, college Ss scoring high on the F Scale (Authoritarian) responded with less, rather than with more, indication of verbal accessibility. (16 ref.)—*E. L. Robinson.*

1240. Smith, G. J. W. Effects of incidental stimulation as related to differences in personality and experimental conditions. *Scand. J. Psychol.*, 1962, 3(1), 16-20.—2 series of experiments, where reactions to incidental stimulation as measured by means of the meta-contrast technique have been compared with more general personality characteristics, are reviewed in this paper in an attempt to reconcile apparently contradictory results due to differences in experimental set-up.—*Journal abstract.*

1241. Smith, William M., & Jones, Marshall B. (George Washington U.) Astronauts, Antarctic scientists, and personal autonomy. *Aerosp. Med.*,

1962, 33(2), 162-166.—A study of 26 astronauts and 57 Antarctic scientists compared with groups of naval aviation cadets and naval retrainees. All of the Ss took the Pensacola Z Scale questionnaire to measure personal autonomy. The astronauts and the scientists were more individualistic than the others. The strong positive correlation between the Z score and performance in the Antarctic was found among those men who have had previous polar experience. This suggests that the predictive value of the Pensacola Z Scale for Antarctic scientists and perhaps for astronauts may increase with the experience and level of the applicants.—*J. C. G. Loring.*

1242. Spreen, Otfried. The translation of personality scales and their adaptation for cross-cultural and clinical use. *Acta psychol., Amsterdam*, 1961, 18(5), 337-341.—Because of the changes necessary in objective tests to make them clinically useful in other languages, they cannot be used for cross-cultural comparisons. The procedure and rationale of test translations is illustrated by a new German anxiety scale based on 3 American scales by Taylor, Cattell, and Welsh. Similar work is in progress on the German version of the MMPI.—*G. Rubin-Rabson.*

1243. Wodder, Niels C., & Hall, William E. (Nebraska State Dept. Education, Lincoln) An analysis of peer ratings. *Personnel guid. J.*, 1962, 40(7), 606-609.—The study concerned structural stability of the personality. The primary purpose concerned the ability of peers who live together to rate each other the same after time lapses. Stability of personality as inferred from a measure of reputation was great over a period of 1 week and significant over a period of 1 and 2 years.—*S. Kavruck.*

1244. Wrightsman, Lawrence S., Jr. (George Peabody Coll. Teachers) Authoritarianism and self awareness. *J. soc. Psychol.*, 1962, 56, 179-185.—The California F Scale and a self-rating scale created for this study were given to 93 Ss. The latter scale consisted of graphic ratings of the 10 underlying ideological components of the authoritarian syndrome, as hypothesized by its authors. Ss highest on the F Scale rated themselves significantly higher on most dimensions and on total score than did the least authoritarian Ss. Both high and low authoritarians possessed some self-awareness about the extremity of their positions. This finding is in conflict with some previous research and theory.—*Author abstract.*

Inventories

1245. Azrin, N. H., Holz, W., & Goldiamond, I. (Anna State Hosp., Ill.) Response bias in questionnaire reports. *J. consult. Psychol.*, 1961, 25(4), 324-326.—Students responded to a questionnaire used previously with combat flyers in terms of what is expected by a commanding officer. Rank order for students and flyers is essentially the same, suggesting that results of previous study may be due to response bias.—*E. R. Oetting.*

1246. Bendig, A. W. (U. Pittsburgh) A factor analysis of personality scales including the Buss-Durkee Hostility Inventory. *J. gen. Psychol.*, 1962, 66, 179-183.—9 personality scales and a scale of verbal ability were administered to 251 college students, and 4 centroid factors were extracted from the intercorrelation matrix. The scales included 3 "markers" for the factor of Extraversion-Introversion (EI) taken from the MMPI and the Maudsley Personality

Inventory; 3 scales (including the Manifest Anxiety scale) defining the Emotionality (EM) factor; and measures of "attitudinal hostility" and "motor hostility" obtained by combining certain subscales in the Buss-Durkee Hostility Inventory. The original orthogonal factors were rotated to oblique simple structure using the analytic oblimax criterion. The rotated factors were readily identifiable as EI, EM, Hostility (H), and Verbal Ability (V). The EM and H factors appeared to be moderately and positively correlated. It was suggested that Factor H may be the mirror image of the 2nd-order factor unifying the Friendliness and Personal Relations scales of the Guilford Zimmerman Temperament Survey.—*Author Abstract.*

1247. Borgatta, Edgar F. (Cornell U.) The coincidence of subtests in four personality inventories. *J. soc. Psychol.*, 1962, 56, 227-244.—An analysis of 4 well known personality inventories that stress subtests with orthogonal content, indicates that 2 main clusters occur, one associated with a concept of extraversion and the other with emotional stability. Several additional minor clusters occurred, but in general the alignment of the subtests left much to be desired. The analysis suggested the importance of examining the generality of structures within inventories for males and females separately. The meaningfulness of 2nd-order factors of personality inventory subtests was questioned on the basis of subtest design objectives. Existence of 2nd-order factors among subtests indicated an inadequate criterion. The point was stressed that oblique solutions need not be utilized if items could be located to represent the orthogonal factors, even if the vast majority of items seemed to suggest an oblique solution.—*Author abstract.*

1248. Campbell, David Phillip. (U. Minnesota) Psychometric analysis of response patterns to interest inventory items. *Dissert. Abstr.*, 1961, 21(10), 3156-3157.—*Abstract.*

1249. Edwards, A. L. (U. Washington) Social desirability or acquiescence in the MMPI? A case study with the SD Scale. *J. abnorm. soc. Psychol.*, 1961, 63(2), 351-359.—In this, his Presidential Address to the Division of Evaluation and Measurement of the American Psychological Association, September 1960, the author reviews the research pertinent to the measurement of the dimensions of "social desirability" and "acquiescent response set." Results of new data derived from an analysis of responses to the MMPI were presented to indicate the validity of the explanation in terms of the dimension of social desirability.—*G. Frank.*

1250. Edwards, Allen L. (U. Washington) Social desirability and expected means on MMPI scales. *Educ. psychol. Measmt.*, 1962, 22(1), 71-76.—Based on data from earlier studies the average probability, P , of a socially desirable response, defined as a True response to an item with a socially desirable scale value or a False response to an item with a socially undesirable scale value, was estimated as .81. The average probability, $Q = 1 - P$, of a socially undesirable response was estimated as .19. . . . An equation was presented in which the values of P and Q were applied to the number of items keyed for socially desirable responses and the number of items keyed for socially undesirable responses in each of 43 MMPI scales to obtain predicted

means for the scales. The predicted means were found to correlate .93 with the observed means based upon a sample of 155 males."—*W. Coleman.*

1251. Evans, Gloria Carey. (Swarthmore Coll.) **The influence of "fake" personality evaluations on self description.** *J. Psychol.*, 1962, 53(2), 457-463.—68 undergraduates completed a personality inventory which included 150 adjectives to be answered on a 4-point scale according to the degree to which each adjective characterized the individual. $\frac{1}{2}$ of the Ss (experimental group) subsequently received identical evaluations supposedly based on the personality inventory. All Ss then completed a 2nd questionnaire, which included the same 150 adjectives, and response changes from the 1st to the 2nd admission were scored for each S. The experimental group modified its self-description significantly ($p < .001$) in the direction of the fake evaluations while the control group showed no such modification. Negative evaluations had as much effect on the revised descriptions as did the positive ones.—*Author abstract.*

1252. Eysenck, H. J. (U. London) **Response set, authoritarianism and personality questionnaires.** *Brit. J. soc. clin. Psychol.*, 1962, 1(1), 20-24.—10 measures, based upon data obtained by giving the Maudsley Personality Inventory, part of the MMPI, and the Jackson-Messick version of the F Scale to 137 neurotic Ss, were factor analyzed. As predicted, the personality tests yielded no evidence of response sets of "acquiescence" or "indecisiveness." It was suggested that "acquiescence" response set may be a tendency peculiar to questionnaires of social attitudes, personal opinions, etc.—*C. M. Franks.*

1253. Eysenck, S. B. G. **The validity of a personality questionnaire as determined by the method of nominated groups.** *Life Sci.*, 1962, No. 1, 13-18.—"A study is reported of the validity of the Maudsley Personality Inventory, using the method of nominated groups. Judges nominated persons of their acquaintance whose behavior showed them to be outstandingly high or low on either one or both of the dimensions of extraversion-introversion and stability-neuroticism. Questionnaire answers of these subjects on the Maudsley Personality Inventory, which purports to measure these two dimensions, were found to be related at very high levels of significance to the nominations they had received indicating considerable validity for the Inventory in question."—*C. T. Morgan.*

1254. Finney, Joseph C. (Hawaii Dept. Health, Honolulu) **The MMPI as a measure of character structure as revealed by factor analysis.** *J. consult. Psychol.*, 1961, 25(4), 327-336.—56 Minnesota Multiphasic Personality Inventory scales and 2 individual items are factor analyzed by centroid and rotation to oblique simple structure. Scale loadings and theoretical implication of the resultant factors are discussed. Response set factors prominent in centroid analysis disappear on rotation. K corrected scales show increased purity after rotation, suggesting greater validity of oblique simple rotation factors.—*E. R. Oetting.*

1255. Gauchet, F., & Lambert, R. **Étude factorielle de 3 questionnaires de personnalité: Questionnaires de Cattell, Guilford-Zimmerman et Berger.** [Factorial study of three personality questionnaires: The questionnaires of Cattell, Guilford-Zim-

merman, and Berger.] *Travail hum.*, 1961, 24(3-4), 249-272.—130 students (74 females and 56 males) filled out a questionnaire derived from those of Berger, Cattell, and Guilford-Zimmerman. Factor analysis was made of 3 major traits and their subtraits; (a) emotional stability; (b) cyclothymia, sociability, and activity; and (c) dominance, ascendancy, and polarity. Outside of specific factors, there appeared 4 major factors; emotional stability; activity outside the self; egocentric activity; and secondary behavior, including voluntary control, restraint, and submissiveness.—*R. W. Husband.*

1256. Gynther, Malcolm D., & Gertz, Boris. (South Carolina State Hosp.) **Personality characteristics of student nurses in South Carolina.** *J. soc. Psychol.*, 1962, 56, 277-284.—Edwards Personal Preference Schedule scores were obtained from 222 student nurses who were a representative sample of South Carolina student nurses. 2 raters independently selected the best and worst nurses in terms of technical competence, dependability, initiative, attitude toward patients and colleagues, and related factors. Both raters agreed on 44 "goods" and 43 "poors." Comparison of the results with normative data showed that the student nurses had weaker needs for exhibitionism, dominance, autonomy, and change and stronger needs for orderliness and endurance. The Ss also expressed less need for achievement and were more concerned with guilt feelings than other women their age. The good student nurses had a significantly greater need to be dominant and significantly less interest in orderliness than the poor student nurses. These results suggested that one reason these girls entered the field of nursing was to find security in a well-organized setting in which they did not have to make decisions.—*Author abstract.*

1257. Jackson, Jay M. (U. Kansas) **The stability of Guilford-Zimmerman personality measures.** *J. appl. Psychol.*, 1961, 45(6), 431-434.—In comparing performance on the Guilford-Zimmerman Temperament Survey of the same group of females over a period of time, it was found that the inventory measures "relatively persistent attributes of the persons tested." The N was 96 the 1st time and 49 the 2nd time. (19 ref.)—*J. W. Russell.*

1258. Karr, C. (Portland State Coll.) **Note on the Edwards Personal Preference Schedule and between-subjects variance.** *Psychol. Rep.*, 1962, 10(1), 55-58.—Use of scores on only one variable of a multivariable personality instrument may be unsound in the case of forced-choice inventories (such as EPPS) which produce variable scores about a constant mean and hence are ipsative. However, EPPS variable scores may be more unbiased than scores obtained from inventories with fluctuating means which create variance between Ss. Research is needed to determine the relevance of between Ss variance produced by free-choice instruments.—*B. J. House.*

1259. Krishnan, B. (Mysore U.) **Need for a validity scale in personality inventories.** *Psychol. Stud. Mysore*, 1961, 6(1), 50-54.—A validity scale of 16 statements was prepared to detect lying on a personality test. The scores on "V" scale were found to distribute according to normal probability curve. No sex differences were found. Limits on accepting of data are determined with the "V" scale.—*U. Pareek.*

1260. Lorr, Maurice, & O'Connor, James P. (Catholic U.) **Psychotic symptom patterns in a behavior inventory.** *Educ. psychol. Measmt.*, 1962, 22(1), 139-146.—The Psychotic Reaction Profile (PRP) was designed to measure 10 hypothesized reaction patterns. Observations and ratings were made of 500 male psychotic patients in 47 hospitals. "A multiple group factor analysis confirmed seven of the patterns postulated. The remaining three patterns were represented by an eighth more general factor of Thinking Disorganization."—W. Coleman.

1261. Messick, Samuel. (Educational Testing Service) **Response style and content measures from personality inventories.** *Educ. psychol. Measmt.*, 1962, 22(1), 41-56.—". . . factor analysis was applied to intercorrelations among content scales and stylistic measures as a potential means of separating distinct, but possibly correlated, dimensions of content and style." T/F items were scored separately for 10 relatively homogenous content scales and a measure of defensiveness. The 22 scores that were obtained yielded 3 major factors (about $\frac{2}{3}$ of the common variance) and 5 minor factors. The large factors seemed attributable to response style, but the smaller factors tended to be attributable to specific content dimensions.—W. Coleman.

1262. Phares, E. Jerry, & Adams, Calvin K. (Kansas State U.) **The construct validity of the Edwards PPS Heterosexuality scale.** *J. consult. Psychol.*, 1961, 25(4), 341-344.—High scoring males placed a higher aesthetic value on sexual photographs and may exhibit better retention of sexual material.—E. R. Oetting.

1263. Ray-Chowdhury, K. (Aligarh Muslim U., India) **Allport-Vernon Study of Values (1958 modification) in Indian situation.** *Indian psychol. Bull.*, 1959, 4(2), 67-74.—Score distributions, means, and SDs are presented for a 1958 form of the Allport-Vernon-Lindzey Study of Values, as modified by the author for English-speaking adults in India. Ss were 305 graduate students (of whom 26 were women) in various subject fields at Aligarh Muslim University. K-R reliability coefficients for the 5 value scales are also given, together with intercorrelations of the scales and correlations of these with other personality tests.—J. T. Cowles.

1264. Ray-Chowdhury, K. (Aligarh Muslim U., India) **Allport-Vernon Study of Values (old and new forms) and sex-difference in Indian situation.** *Indian psychol. Bull.*, 1959, 4(2), 52-57.—Summary data are presented for a 1958 form of the Allport-Vernon-Lindzey Study of Values, as modified by the author for English-speaking adults in India; comparative data for the same Ss on the unmodified form of the older Allport-Vernon inventory are also presented. The Ss were 65 baccalaureate students in education at Aligarh Muslim University, about $\frac{1}{2}$ of whom were women. A significant sex difference at the 1% level was found only for the Social scale of the modified form.—J. T. Cowles.

1265. Schutz, Richard E., & Baker, Robert L. (Arizona State U.) **A factor analysis of the Kuder Preference Record: Occupational, Form D.** *Educ. psychol. Measmt.*, 1962, 22(1), 97-104.—Based on a representative sample of 450 freshmen males at Arizona State University, a principal components analysis was performed of the r's for 42 scales of the

Kuder Preference Record. "The analysis yielded seven readily interpretable rotated factors: I. Interperson-Directive, II. Engineering-Physical Science, III. Business-Detail, IV. Business-Aesthetic, V. Verbal-Directive, VI. Outdoor, VII. Health Scientist. The implications of the findings for practical test usage are discussed."—W. Coleman.

1266. Zuckerman, M., & Eisen, B. (Indiana U. Medical Center) **Relationship of acquiescence response set to authoritarianism and dependency.** *Psychol. Rep.*, 1962, 10(1), 95-102.—In one study, with 33 college students, scores on an essay test, designed as an acquiescence-free measure of authoritarianism, correlated significantly with the usual F Scale and the Bass Social Acquiescence Scale, but not with Christie's reversed F scale. In a 2nd study, with 48 students, the Bass measure of acquiescence was significantly correlated with measures of Success-Autonomy in 3 of the 5 techniques measuring this dimension.—B. J. House.

Projective Methods

1267. Borelli, George Louis. (Ohio State U.) **A study of the meanings of Rorschach cards through use of the Semantic Differential technique.** *Dissert. Abstr.*, 1961, 21(10), 3161-3162—Abstract.

1268. Dodds, Josiah Boggs. (Cornell U.) **An experimental study of the determinants of affiliation imagery in Thematic Apperception stories.** *Dissert. Abstr.*, 1961, 21(12), 3842-3843.—Abstract.

1269. Marquis, John Neil. (U. Michigan) **Fantasy measures of aggressive behavior.** *Dissert. Abstr.*, 1961, 21(12), 3854-3855.—Abstract.

1270. Mathieu, Michel. **Le Test de l'Arbre en psycho-pathologie.** [The Tree Test in psychopathology.] Lyon, France: Imprimerie BOSC Freres, 1961, 83 p.—The Tree Test, as developed by Charles Koch of the Institute of Applied Psychology, Lucerne, is described as a projective test. The book contains chapters on the history of the Tree Test in clinical psychology, hypotheses and interpretations, application of factor analysis tables, etc. The Ss include normals, feeble-minded, delinquents, and surgical and psychiatric patients.—V. Sanua.

1271. Nickols, J. **A form referent for the Ancillary Projective Test (APT).** *Percept. mot. Skills*, 1962, 14, 216.—48 normals identified correspondences between 5 point splotches (Ancillary Projective Test) and 12 irregular forms used for reference.—W. H. Guertin.

1272. Pate, Kenton Donese. (U. Houston) **The Picture Arrangement Test as related to occupational choice and values.** *Dissert. Abstr.*, 1961, 21(12), 3856.—Abstract.

1273. Reisman, John M. (Rochester Child Guidance Clinic, N. Y.) **An interpretation of m.** *J. consult. Psychol.*, 1961, 25(4), 367.—An analysis of adolescents. Rorschach's contradicts Piotrowski's hypothesis, that types of movement in m responses are always different from M or FM.—E. R. Oetting.

1274. Ricciuti, Henry. (Cornell U.) **Development and application of projective techniques of personality.** *Rev. educ. Res.*, 1962, 32(1), 64-77.—Following a short summary of important books and general articles, the discussion focuses upon the following: (a) major theoretical and methodological

trends, (b) new approaches in the development or use of projective techniques, and (c) representative findings of validity and predictive studies. Attention has been directed primarily to projective methods that are currently or potentially amenable to use as quantitative instruments and to techniques whose potential value is not limited to the study of psychopathology. The practical usefulness of projective techniques in predicting educational or industrial criteria continues to be small. However, there is a place for projective methods in educational research when they are used in combination with other techniques in studies designed within a theoretical framework that permits some evaluation of the construct validity of the projective technique itself. (71 ref.)—*F. Goldsmith*.

1275. Rychlak, Joseph F., & Guinouard, Donald E. (St. Louis U.) Symbolic interpretation of Rorschach content. *J. consult. Psychol.*, 1961, 25 (4), 370.—Rorschach content for 11-14 year old boys and girls is directly related to personality characteristics. Theory of "universal" symbolism through broad cultural factors is discussed.—*E. R. Oetting*.

1276. Smith, Charles Philip. (U. Michigan) Situational determinants of the expression of achievement motivation in thematic apperception. *Dissert. Abstr.*, 1961, 21(12), 3875-3876.—*Abstract*.

1277. Stančák, A., & Fraenkel, E. (Psychiatrická Klinika, Košice) Faktorová analýza Rorschachových nálezov u neuróz pred a po aplikácii etylalkoholu. [Factor analysis of Rorschach's findings regarding neuroses before and after the application of ethylalcohol.] *Ceskoslov. Psychol.*, 1961, 5, 363-372.—Analysis of findings concerning a Rorschach experiment with 45 neurotics aged 18-50 immediately following, and 4 days after consumption of 0.5 gm. pure alcohol. 7 factors are found in both experiments. 2 are common to both: R (total responses) and T (time). There are 3 more factors in the experiment without alcohol: Do (oligophrenic detail), O (original response), and W (whole response). Factors C (color response) and F (form response) are stated after alcohol consumption. (22 ref., Russian & English summaries)—*V. Břicháček*.

1278. Zulliger, Hans. Der Zulliger-Tafel-Test (Tafeln-Z-Test): Ein Rorschach-Verfahren mit drei Tafeln für individuelle psychologische Prüfungen. [Zulliger Card Test (Card Z Test): A three-card Rorschach method for individual administration.] Bern, Switzerland: Huber, 1962. (1 card, 290 p., DM 32.; 3 test cards, DM 9.; 50 response sheets, DM 5.)—This is the 2nd, enlarged edition of a widely distributed text and exercise book on the Rorschach. It is concerned with: (a) quantitative evaluation, (b) general psychological evaluation, and (c) evaluation of specific problems (school problems, maladaptation, retardation, occupation, abnormality). It also contains a mixture of selected case reports and papers on the Rorschach. The analysis is in terms of individual case reports, and no norms are given.—*J. C. Brengelmann*.

PERSONALITY DIAGNOSIS

1279. Beitner, M. S. (Garden Grove, Calif.) Word meaning and sexual identification in paranoid schizophrenics and anxiety neurotics. *J. abnorm. soc. Psychol.*, 1961, 63(2), 289-293.—From

psychoanalytic theory it is reasoned that the paranoid schizophrenic is one who has not made an adequate identification with the parent of like sex; other theoretical formulations presuppose a lack of identification with either parent. To test which of these hypotheses is valid, Osgood's Semantic Differential was used as a measure of identification (as established by Lazowick, 1955). It was given to a sample of hospitalized paranoid schizophrenics, an outpatient VA mental hygiene clinic sample of anxiety neurotics, and 2 control groups, hospitalized TB patients and working people. The results indicated that the paranoid schizophrenic showed lack of identification with either parent. To some extent, this was true of the identification pattern of the neurotic group, but the latter also showed confusion of identification.—*G. Frank*.

1280. Dar'in, E. (Mental Health Clinic, Ramat Hen) Tofaot shel hafraa hitpathutit etsel yeladim. [Developmental disturbances among children.] *Dap. refuim*, 1961, 20, 489-495.—Developmental processes are defined, and causes of clinical disturbances in them are analyzed. Significant pathological signs are described as they appear in examinations: skull X rays, EEG, and psychological tests. The importance of the latter is stressed. Problems related to etiology, therapy, and prognosis of these cases are discussed. (English & French summaries)—*H. Ormian*.

1281. Eysenck, H. J., & Claridge, G. (Inst. Psychiatry, Maudsley Hosp., U. London) The position of hysterics and dysthymics in a two-dimensional framework of personality description. *J. abnorm. soc. Psychol.*, 1962, 64(1), 46-55.—Eysenck's theory (1957) predicts that 2 dimensions, neuroticism (N) and introversion-extraversion (IE), may be used to describe neurotics. Hysterics and psychopaths are characterized as high N-E; obsessive, compulsive, depressive, anxious, or phobic patients would be N-I. To some extent this prediction has not been borne out, particularly with regard to the hysterics. The present research attempted to reassess the validity of these hypotheses. Sedation threshold, Maudsley Personality Interview, reaction test, and spiral aftereffects were obtained on Ss. Single-task analysis did not identify the Ss as predicted; multiple discriminant function did. Factor analysis isolated the original 2 dimensions.—*G. Frank*.

1282. Friedman, Joseph, & Schiffman, Harold. Early recollections of schizophrenic and depressed patients. *J. indiv. Psychol.*, 1962, 18(1), 57-61.—Psychologically unsophisticated judges can rapidly distinguish psychotic depressives from paranoid schizophrenics on the basis of the patients' early recollections. "It would appear feasible to differentiate other nosological groups similarly through early recollections."—*A. R. Howard*.

1283. Heilizer, F. (VA Hosp., Northampton, Mass.) A note on the scoring of ego disjunction. *J. abnorm. soc. Psychol.*, 1961, 63(2), 438-439.—A statistical reanalysis of the findings presented previously (see 34: 1064) demonstrated that the method of measuring ego disjunction was not as effective in distinguishing schizophrenics, character disorders, and college students as has been reported.—*G. Frank*.

1284. Jackson, Marilyn, & Sechrest, Lee. Early recollections in 4 neurotic diagnostic categories.

J. indiv. Psychol., 1962, 18(1), 52-56.—Early childhood recollections of 77 patients confirm a number of hypotheses including the greater likelihood of finding fear themes in anxiety neurotics, abandonment themes in depressed patients, and themes of gastrointestinal distress in persons with gastrointestinal disorders.—*A. R. Howard.*

1285. Kidd, Cecil B. (U. Edinburgh, Scotland) **Criteria for admission of the elderly to geriatric and psychiatric units.** *J. ment. Sci.*, 1962, 108, 68-74.—100 patients from each of 2 units were randomly selected for study using 4 psychological tests. Patients could be graded from entirely mentally ill to entirely physically ill. 25%-35% of the elderly patients were misplaced.—*W. L. Wilkins.*

1286. Kogan, V. M., & Rogovin, M. C. (Central Research Inst., Moscow, USSR) **Assotsiativnyi eksperiment i ego klinicheskoe primenenie.** [The association experiment and its clinical application.] *Vop. Psikh.*, 1961, No. 6, 105-113.—A review of the classical types of association experiment and a description of some current diagnostic uses of word association in the Soviet Union. It is pointed out that difficulty of association is observed even when speech is essentially normal. Thus, difficulty of association is not a disturbance of habitual behavior but occurs when habits are deautomatized. Various response indices have diagnostic value, e.g., the rhythm and patterning of responses as well as the latency and types of responses. Different types of pathology affect free and controlled association in different ways. For example, arterosclerosis and hypertension can sometimes be differentiated by differential pulse rate and latencies of responses in controlled association experiments.—*H. Pick.*

1287. Kondáš, O. (Psychiatrická Léčebna, Velké Levare) **Naše zkušenosti s metodou slovného stereotypu a možnosti jej použítia u psychóz.** [Experiences with the method of the verbal stereotype and its application in psychoses.] *Ceskoslov. Psychol.*, 1961, 5, 257-266.—The adjusted method of the verbal stereotype (L. G. Pervov) and its practical application in psychiatry is described. The method is based on the principle of overlearning of patients' association pairs and is used along with the association experiment, verifying and complementing it. Statistical differences between schizophrenics, other psychotics, neurotics, and healthy Ss are found in the latency and in the number of incorrect reactions. (Russian & English summaries)—*V. Bricháček.*

1288. Laforge, Rolfe. (U. Illinois) **Objective estimates of clinical judgments.** *J. consult. Psychol.*, 1961, 25(4), 360-361.—A discussion of cues used in clinically inferring repression from a Minnesota Multiphasic Personality Inventory profile. Reconstituted data are cross validated, and both a Guttman-type scale and a scoring procedure are presented that relate to inference of repression from the MMPI.—*E. R. Oetting.*

1289. Lersch, Philipp. **Gesicht und Seele.** (5th ed.) [A psychological study of facial expression.] Munich, Germany: Reinhardt, 1961. 168 p., 12 cards. DM 8.80 (cloth), M 6.80 (paper).—This is the 5th edition of an anecdotal treatise, unchanged since 1932, on facial expression.—*J. C. Brengelmann.*

1290. Nurnberger, John I. (Indiana U. Medical Center) **Diagnostic signs and symptoms of emotional disorders.** Grand Rapids, Mich.: Aquinas College, 1961. 41 p. \$.75.—Understanding the disordered man depends on some understanding of the ordered man, if he be the norm from which deviations may be symptomatic. Symptoms depend upon cultural norms, but also on constitutional factors and developmental experiences. The human organism can exploit only behavioral mechanisms which have become a part of familiar routines acquired during the course of development, and a developmental analysis of symptoms is necessary. Symptoms can be ranged on a continuum from least to most significant in terms of degree of distortion of reality, degree of restriction of reality, and extent of compromise of object relationships.—*W. L. Wilkins.*

1291. Oskamp, Stuart Willard. (Stanford U.) **The relationship of clinical experience and training methods to several criteria of clinical prediction.** *Dissert. Abstr.*, 1961, 21(11), 3527-3528.—*Abstract.*

1292. Shulman, Bernard H. **The family constellation in personality diagnosis.** *J. indiv. Psychol.*, 1962, 18(1), 35-47.—"A Family Constellation Interview Guide, questioning the subject about his parents and siblings, and calling for his rating of himself and his siblings in essential respects, is presented, discussed, and illustrated by a case." The style of life is revealed "in less time and more easily than any other diagnostic tool with which the writer is acquainted."—*A. R. Howard.*

1293. Terrill, James McGuffin. (Stanford U.) **The relationships between Level II and Level III in the interpersonal system of personality diagnosis.** *Dissert. Abstr.*, 1961, 21(11), 3529-3530.—*Abstract.*

1294. Ward, Joe H., Jr. (Personnel Lab., Wright Air Development Division, Dayton, O.) **Comments on "The Paramorphic Representation of Clinical Judgment."** *Psychol. Bull.*, 1962, 59(1), 74-76.—Hoffman's (see 34: 7779) position concerning the independent contribution of a variable in the judgment process is examined by presenting several empirical examples. It is concluded that the concept of relative weight will not provide any information about the independent contribution of a predictor.—*W. J. Meyer.*

1295. Wittenborn, J. R. (Rutgers U., Interdisciplinary Research Cent.) **The dimensions of psychosis.** *J. nerv. ment. Dis.*, 1962, 134(2), 117-128.—"The present report describes a factor analysis of 98 new or revised rating scales. The analysis was conducted for the purpose of providing scoring dimensions for the new comprehensive scales. The extensions broaden the symptomatic coverage of the scales, and the revisions are simplifications and refinements resulting from experience with the original scales."—*N. H. Pronko.*

1296. Zigler, E., & Phillips, L. (Yale U.) **Psychiatric diagnosis: A critique.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 607-618.—An analysis of the problems involved in psychiatric diagnosis, its validity, reliability, purpose, and achievement in light of the authors' own opinions and empirical evidence. They conclude that a classificatory system in psychiatry serves the same essential purpose as tax-

onomy in science in general, and that a simple, coherent, and meaningful system of classification based on behavioral correlates of psychiatric syndromes is possible. (77 ref.)—G. Frank.

PERSONALITY ADJUSTMENT

1297. Bene, Eva. Anxiety and emotional impoverishment in men under stress. *Brit. J. med. Psychol.*, 1961, 34, 281-289.—61 Hungarian refugees were studied with the Rorschach, a sentence completion test, and a questionnaire. The results are interpreted as showing that anxiety, guilt, depression, and reduced emotion occurred frequently in these Ss. Emphasis is placed on the effects of stress which did not occur early in life.—C. L. Winder.

1298. Berlew, D. E. (Wesleyan U.) Interpersonal sensitivity and motive strength. *J. abnorm. soc. Psychol.*, 1961, 63(2), 390-394.—Empathy, or interpersonal sensitivity, as measured by the method of Bronfenbrenner et al. (1958), involving ratings of self and others on adjectives describing behavior in a small group situation, was hypothesized to vary with degree of motivation. Criterion for motivation were scores on n Achievement, n Affiliation, and n Power, as found in TAT data, (McClelland et al., 1953). It was assumed that moderately motivated Ss would be more empathic (make more accurate judgments about others) than Ss high or low in motivation as measured. The results supported the hypothesis.—G. Frank.

1299. Diel, P. Psychologie de la motivation: Theorie et application therapeutique. (2nd ed.) [Psychology of motivation: Theory and therapeutic application.] Paris, France: Presses Universitaires France, 1962. 323 p. NF 12.—The technique of investigation used in this study is introspection. The ideal for man is to be able to examine his own psyche and pursue his "false" motivations in his subconscious. False motivation is the principle behind psychic illness. To unmask its various forms is to explain the method of an objective introspection. The author also uses clinical observation and intuition. He presents a detailed case which he analyzed.—V. Sanua.

1300. Dittes, J. E. (Yale U.) Impulsive closure as reaction to failure-induced threat. *J. abnorm. soc. Psychol.*, 1961, 63(3), 562-569.—"Some persons impose meaning and pattern—closure—on ambiguous stimuli more readily than other persons. . . the hypothesis is proposed that closure generally acquires a self-esteem enhancing reward value and that persons experiencing greater need to maintain or enhance self-esteem are . . . likely to impose more impulsive closure. Self-esteem was manipulated by causing some subjects to experience failure on an ego involving task and others . . . to experience failure on a noninvolving task or to experience success. Ego involving failure resulted in more impulsive closure."—G. Frank.

1301. Eysenck, H. J. (U. London) A note on "Impulse Repression and Emotional Adjustment." *J. consult. Psychol.*, 1961, 25(4), 362-363.—A critique of Grater (see 34: 8202) emphasizing necessity for multidimensional approach in studying neuroticism.—E. R. Oetting.

1302. Farber, B. (U. Illinois). Elements of competence in interpersonal relations: A factor analysis. *Sociometry*, 1962, 25(1), 30-47.—The responses of 495 husbands to 104 items representing competence in interpersonal relations were factor analyzed. A combined Centroid and Verimax solution yielded 11 factors with a high loading on at least 3 items. These 11 factors were grouped into 5 content categories: perceived empathy, autonomy, resourcefulness, cooperativeness, and tested empathy. Each element of competence may consist of a G-factor and special factors related to particular relationships. Cooperativeness as an element of competence is not defined by Foote and Cottrell although their conception of autonomy, resourcefulness, and empathy are generally supported. "Empathy may be viewed more profitably as a social process than as a capacity." Possible sources of invalid results are discussed.—H. P. Shelley.

1303. Goins, Alvin E. (USN Research Lab.) Rigidity-flexibility: Toward clarification. *Merrill-Palmer Quart.*, 1962, 8(1), 41-61.—The author presents "a comprehensive conceptualization of rigidity-flexibility." (106 ref.)—E. L. Robinson.

1304. Horowitz, Esther. (Columbia U.) Reported embarrassment memories of elementary school, high school, and college students. *J. soc. Psychol.*, 1962, 56, 317-325.—The purpose of this study was to estimate whether embarrassing experiences are less likely to be reported by Ss dissatisfied with their self-concepts than by Ss who express greater self-acceptance. Another aspect of the problem was whether an increase in chronological age is accompanied by a tendency to report fewer early embarrassment memories. The Ss were 100 elementary school students, 100 high school students, and 100 college students. The data were obtained by 2 questionnaires: (a) an Embarrassment questionnaire, and (b) a Self-Concept and Ego-Ideal questionnaire. The results were as follows: (a) Within each educational group (elementary, secondary, college) the older the S, the later the reported age of earliest remembered embarrassing experience. (b) There was a significant difference among the 3 samples in the frequency of reported early embarrassment memories. The high school and college samples reported fewer embarrassing memories for the age period 2-11 years than did the elementary school sample. (c) A greater proportion of embarrassment memories was reported by the high school and college samples for the age period 11-15 years than for the period 2-11 years. (d) On the high school and college levels, the greater the discrepancy between self-concept and ego-ideal, the fewer the reported embarrassment memories.—Author abstract.

1305. Howe, E. S. (U. Maryland School Medicine) Postponement behavior as a function of approach and avoidance motivation. *Psychol. Rep.*, 1962, 10(1), 275-283.—A request for volunteers for an experiment involving electric shock and a \$3.00 reward was submitted to 178 college students. Ss indicated preference for immediate experimentation or postponements of 1, 2, or 3 weeks. 50 males and 56 females volunteered. For pooled Ss postponements increased as a function of scores on a n Harm-avoidance test and decreased as a function of n Cash scores. There was interaction between these effects and sex. Scores on 2 anxiety scales were not related

to postponement. Results were related to Miller's theory of approach-avoidance gradients.—B. J. House.

1306. Jones, E. E., Davis, K. E., & Gergen, K. J. (Duke U.) **Role playing variations and their informational value for person perception.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 302-310.—The hypotheses were offered that the degree to which an individual conforms to a role (a set of behavior expectancies), the less he reveals about himself; in complete identity with the role, S's behavior is almost entirely determined by what he experiences to be expected of him; and behavior inconsistent with role expectancy is generally determined by idiosyncratic attitudes. Ss listened to recorded interviews between a psychologist and a "job applicant." The positions were that of submariner and astronaut; both, as described, involved different personality types. Tapes were made between interviewer and interviewee for the 2 positions, from which 4 tapes were produced: 2 with the actual answers, and 2 with answers of 1 spliced to questions of the other halfway through the tape. Ss tended to perceive the out-of-role answers as revealing more of the interviewee's personality.—G. Frank.

1307. Lawrence S. Wrightsman, Jr. (George Peabody Coll. Teachers) **The effects of anxiety, achievement motivation, and task importance upon performance on an intelligence test.** *J. educ. Psychol.*, 1962, 53(3), 150-156.—In a study to determine how anxiety and achievement motivation affect performance on an intelligence test under 2 conditions of task importance, 234 Ss completed the MA scale, a projective measure of achievement motivation, and an intelligence test. 122 Ss were led to believe that performance on the intelligence test was very important; the other 112 Ss were led to believe the test was given only to collect norms. When the test was seen as important, anxious Ss scored significantly lower than nonanxious Ss. In the other condition, anxiety was unrelated to test performance. Ss high in internalized achievement motivation performed equally well on the test regardless of its purported importance. Low achievement motivation Ss did less well when they thought the test was important, perhaps indicating an avoidance reaction to stress.—*Journal abstract.*

1308. Lobsenz, Norman M. **Is anybody happy? A study of the American search for pleasure.** Garden City, N. Y.: Doubleday, 1962. 190 p. \$4.50.—A professional writer examines an American paradox—the fact that Americans have more leisure than any people have ever had and apparently enjoy it less.—C. H. Miley.

1309. Mayer, A. J., & Sharp, H. (Wayne State U.) **Religious preference and worldly success.** *Amer. sociol. Rev.*, 1962, 27(2), 218-227.—"The relationship between religious preference and worldly success as currently found in metropolitan Detroit is analyzed. The data are derived from a series of personal interviews with probability samples of all greater Detroit adults. White and nonwhite adults are analyzed separately. An attempt is made to place all religious denominations on an 'equal footing' with respect to those ascribed factors which are conducive to high economic achievement . . . in an urban environment. Actual achievement is then measured against the potential for this performance. The re-

sults offer some support for a contemporary interpretation of the Weberian thesis of the Protestant ethic, while presenting important modifications. Most Protestant denominations far exceed the Catholics in economic standing, and the various Protestant denominations are ranked in a general order which is in substantial agreement with expectations. Possible explanations for the high achievement of Jews and Detroiters of the Eastern Orthodox faith are presented.—L. Berkowitz.

1310. Moss, H. A. (Child Research Branch, National Inst. Mental Health) **The influence of personality and situational cautiousness on conceptual behavior.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 629-635.—An assessment of the degree to which cautiousness ("the tendency to behave in a manner designed to avoid potential failure or disapproval experiences . . . often at the expense of other satisfactions") affected responsiveness to TAT cards and MAPS. Degree of cautiousness was assessed by performance on the Rotter Level of Aspiration Board (see 19: 2261). Ss were then administered a test of social acceptability of attitudes and were either told that they scored low (failure experience), scored high (success experience), or were given no feedback (neutral). Comparisons of cautious (C) and non-cautious (NC) Ss revealed that degree of cautiousness distinguished C and NC Ss in the neutral situation only. The finding supported the assumption that cautiousness, as a personality trait, could also be used to describe conceptual behavior.—G. Frank.

1311. Muecher, H., & Heckhausen, H. **Influence of mental activity and achievement motivation on skeletal muscle tonus.** *Percept. mot. Skills*, 1962, 14, 217-218.—Mental activity (3 tasks) raised the electromyograph of 33 students to a level higher than that characteristic for rest. Records of Ss classified as high in achievement motivation shown in TAT stories were higher than those for Ss with low or medium achievement motivation.—W. H. Guertin.

1312. Murstein, Bernard I. (Interfaith Counseling Center, Portland, Ore.) **The relation of the Famous Sayings Test to Self- and Ideal-Self-Adjustment.** *J. consult. Psychol.*, 1961, 25(4), 368.—Famous Sayings Test scores related to Butler-Haig S10 Q sort in psychology students. Only Social Acquiescence is related to Self-Ideal-Self-Adjustment discrepancy.—E. R. Oetting.

1313. Pedersen, S. **Personality formation in adolescence and its impact upon the psycho-analytical treatment of adults.** *Int. J. Psycho-Anal.*, 1961, 42, 381-388.—Speculations regarding the processes operating in the psychological development of adolescences. The adolescent development of 4 patients is described to demonstrate the author's views.—G. Elias.

1314. Peters, Alice. (New York U.) **An investigation of the relationship between the inability of some women in psychotherapy to accept their female role and their perception of their mothers' attitudes toward the female role.** *Disser. Abstr.*, 1961, 21(12), 3856-3857.—*Abstract.*

1315. Rabin, Herbert M. (U. Illinois) **Perception of others by adjusted and maladjusted subjects as reflected in measures of perceptual space.** *J. soc. Psychol.*, 1962, 56, 149-158.—An investigation of generalized perceptual tendencies

was conducted using Cronbach's (1958) proposed methodology to measure a person's perceptual space. A very heterogeneous group of 10 individuals was rated (each separately) by the Ss to determine the perceptual space of the Ss. A 36-item 5-point adjectival rating scale was used. The scale was factored into dimensions labeled Unhappy, Patient-Agreeable, Dependable, and Adventurous. Of the 80 Ss who participated, 40 were classified as "maladjusted" (primarily voluntary outpatients with neurotic difficulties) and 40 Ss as "adjusted." The following results were obtained: (a) moderately reliable differences among the Ss in certain generalized perceptual tendencies were demonstrated; (b) Ss who perceive the individuals as widely or narrowly divergent on one dimension tended to see them as divergent to a similar degree on the other dimensions; (c) maladjusted Ss reported significantly greater personality differences among the individuals than did adjusted Ss, and females reported significantly greater differences than males—these differences were consistent over all 4 dimensions; (d) there were no significant differences between the adjustment or between the sex subgroups in their average ratings of the individuals. The findings indicated Cronbach's proposed methodology has considerable promise in the area of interpersonal perception.—*Author abstract.*

1316. Roff, M. (U. Minnesota) **Childhood social interactions and young adult bad conduct.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 333-337.—Case history data of former patients at 2 child guidance clinics that had been subsequently discharged from service because of bad conduct were examined. A major and significant trend was found reflecting an inverse relationship between peer group adjustment and evidence of bad conduct. The adult "bad conduct" group seemed to be characterized as children who had antagonized their peers to an unusual degree. The results demonstrated the predictive value of adjustment in childhood and behavior in adulthood.—*G. Frank.*

1317. Rosenbaum, M. E., & Stanners, R. F. (State U. Iowa) **Self-esteem, manifest hostility, and expression of hostility.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 646-649.—In a previous study (see 34: 7173), it was shown that Ss with low self-esteem, as measured by the Self-Esteem Scale, and high manifest hostility, as measured by Siegel's (1956) Manifest Hostility scale (MH scale), were found to have a high hostility response tendency. In the present study, arousal of hostility was stimulated by criticizing college Ss performing tests, measured via TAT cards, and related to the measure of self-esteem. Ss with a high degree of hostility arousal showed high MH scale scores but not low scores on the Self-Esteem Scale.—*G. Frank.*

1318. Sacher, Horst. (Universitätsnervenklinik, Erlangen, Germany) **Der Moralcharakter als Regulierungsgefüge der Persönlichkeit.** [The moral character as regulatory stratum of the personality.] *Z. exp. angew. Psychol.*, 1961, 8(4), 633-687.—Structure and regulatory function of the moral character are described; and 25 examples, taken from fictional literature, are given in order to demonstrate types of the regulatory dynamics.—*W. J. Koppitz.*

1319. Shanmugan, T. E. (U. Madras). **Voluntary inhibition and disinhibition in relation to personality traits.** *Psychol. Stud., Mysore*, 1961,

6(1), 36-40.—50 boys 15-17 years of age were given a word association test through which voluntary inhibition and disinhibition were studied. The Maudsley Personality Inventory was also used. Significant positive correlation was found between inhibition and neuroticism, and negative correlation between extroversion-introversion traits and inhibition. There was no significant correlations between inhibition and disinhibition, and extroversion-introversion traits and disinhibition and neuroticism.—*U. Pareek.*

1320. Singh, S. D., Sharma, N. R., & Vimal, Kumari. (Agra U.) **Personality differences in fluctuation of attention.** *Psychol. Stud. Mysore*, 1961, 6(1), 55-60.—Maudsley Personality Inventory was administered to 40 male adult students who were also tested for fluctuation of attention on the masson disc. Results show that extraverts fluctuated more than the introverts, the neurotics more than the non-neurotics. The extraverted neurotics fluctuated the most and the introverted non-neurotics the least.—*U. Pareek.*

1321. Strider, Fred Donald. (U. Nebraska) **Self concept factors affecting judgments of others.** *Dissert. Abstr.*, 1961, 21(12), 3858.—*Abstract.*

1322. Talbot, E., Miller, S. C., & White, R. B. (Austen Riggs Center, Stockbridge, Mass.) **Some aspects of self-conceptions and role demands in a therapeutic community.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 338-345.—"A study of role demand and self-conception using the semantic differential technique was conducted in a psychiatric hospital organized as a therapeutic community." Patients and staff described various roles in the hospital, reflecting different levels of social structure within that community (worker, citizen, student), and gave descriptions of their self-concept. Self-concept was seen to be related to the demands perceived by the different roles in that Ss with greater ego organization gave self-descriptions reflecting the capacity to meet the demands they perceived were made on them by these various social roles.—*G. Frank.*

1323. Tanco-Duque, Rosa. (Transversal 25, No. 57-81, Bogotá, Colombia) **Schuldgefühl und soziale Entfremdung.** [Guilt feeling and social estrangement.] *Z. psycho-som. Med.*, 1961, 7, 190-192.—"Although existence of adequate guilt feelings is not denied, the social-historic conditioning of neurotic guilt feelings is emphasized. Such guilt feelings develop from the conflict between the adaptation to an introjected estrangement and the protest against it."—*I. Neufeld.*

1324. Veroff, J., Feld, Sheila, & Gurin, Gerald. (U. Michigan) **Achievement motivation and religious background.** *Amer. sociol. Rev.*, 1962, 27(2), 205-217.—"High achievement motivation scores derived from thematic apperceptive measures administered in a nationwide sample survey were most prevalent in Jewish men, and more prevalent in Catholic than in Protestant men. This high incidence among Catholic men was found attributable largely to the middle-aged group. Furthermore, Catholics' achievement motivation, unlike Protestants' was associated with a low income and a large family. This difference is interpreted as an indication of the more restrictive and concrete significance achievement has for Catholics. From the national survey and from other findings, evidence suggesting that Catholic

child-rearing would induce an achievement orientation sensitive to specific economic failure is offered. The inconsistency of these results with previous findings is interpreted in terms of the high economic status and restricted geographic locale of the population from which previous samples were drawn.—L. Berkowitz.

1325. Wurster, C. R., Bass, B. M., & Alcock, W. (Louisiana State U.) **A test of the proposition: We want to be esteemed most by those we esteem most highly.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 650-653.—To test the proposition, college Ss were first asked to list the names of 15 campus friends. Then S was requested to rank them according to preference as a study partner ("scholastic esteem"), desire to have them join a club of S's ("social esteem"), and desire to give them esteemable social or scholastic information about self. The results indicated a significant correlation between social esteem and the desire for the esteemed to have esteemable social and scholastic information. The scholastically esteemed were more a target for scholastic than social data.—G. Frank.

1326. Zuckerman, Marvin; Levitt, Eugene E., & Lubin, Bernard. (Inst. Psychiatric Research, Indianapolis, Ind.) **Concurrent and construct validity of direct and indirect measures of dependency.** *J. consult. Psychol.*, 1961, 25(4), 316-323.—In sophomore student nurses, peer ratings of dependency are related more highly to more direct measures such as self-ratings, a combination of Gough Dominance and Navran Dependency Questionnaires and Edwards' Personal Preference Schedule. They are not related to Rohde's Sentence Completion test, Group TAT, and Rorschach. Factor analysis of individual scores yields 4 factors, of combination scores yields 1 general dependency factor.—E. R. Oetting.

Anxiety

1327. Aiken, L. R., Jr. (U. North Carolina) **Paper and pencil anxiety.** *Psychol. Rep.*, 1962, 10(1), 107-112.—A method for defining anxiety by cluster analysis is proposed. "The writer pictures anxiety as a linkage construct referring to the mapping of stimuli (anxors) onto an exclusive set of responses (anxiety reaction) and feels that a definition program which begins by isolating an anxiety reaction pattern or cluster is propaedeutic to a search for stimuli which evoke such a set of responses." Several current problems of anxiety are discussed and an empirical example presented which indicates how the program might be carried out.—B. J. House.

1328. Blood, Kenneth Harry. (Washington State U.) **A study of the relationship between anxiety and ambiguity tolerance.** *Dissert. Abstr.*, 1961, 21(11), 3521.—Abstract.

1329. Byrne, D. (U. Texas) **Anxiety and the experimental arousal of affiliation need.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 660-662.—Small groups of college Ss were placed in a 1-way vision observation room; the instructions structured the situation so that personal anxiety was presumed to be high. Other groups were purposefully not exposed to anxiety-producing instructions. Level of anxiety was measured by self-rating scales, need for affiliation was assessed through TAT cards. It was assumed that degree of anxiety would be positively related to de-

gree of need affiliation. Ss high in need affiliation did rate themselves higher in anxiety when placed in the anxiety-producing situation; in the non-anxiety-producing situation, affiliation need was unrelated to anxiety.—G. Frank.

1330. Garre, Walter J. (VA Hosp., San Francisco, Calif.) **Basic anxiety.** New York: Philosophical Library, 1962. 123 p. \$5.00.—The basic concepts of medical psychology and of psychotherapeutic approaches are reviewed from a viewpoint of basic anxiety. The author's perception of the etiology of anxiety is given, and a biological identification is obtained. The thesis propounded appears to be an attempt to explain the origin, persistence, and primacy of anxiety in the neurosis and other functional diseases of the psychobiologic unit.—S. B. Coslett.

1331. Hammes, J. A., & Wiggins, S. L. **Manifest anxiety and appreciation of humor involving emotional content.** *Percept. mot. Skills*, 1962, 14, 291-294.—The purpose of this study was to test the prediction that individuals having high manifest anxiety would appreciate light humor material involving emotions of worry, tension, and depression less than would low-anxious individuals. Selected on the basis of a manifest anxiety scale, low-anxious and high-anxious Ss evaluated the humor content of 30 "Peanuts" cartoon strips, chosen for light humor material. 10 of the cartoons utilized the emotions of worry, depression, and tension as the basis of humor. The prediction was verified with regard to male Ss only, and the results were interpreted in terms of the degree of identification with the principal cartoon characters.—W. H. Guertin.

1332. C. G. Jung Institute. (Zürich, Switzerland) **Die Angst.** [Anxiety.] Zürich, Switzerland: Rascher, 1959. 253 p. S. Fr. 21.40.—In a 1958-59 lecture series at the C. G. Jung Institute, the central topic of "anxiety" was considered in terms of its meaning for or relationship to animals (H. Hediger), children (H. Zulliger), femininity (E. Neumann), politics (U. Schwarz), psychiatry (G. Benedetti), life and death (A. Jores), religion (E. Benz), and occidental painting (W. Ueberwasser).—H. P. David.

1333. Levine, Gene N. (Columbia U.) **Anxiety about illness: Psychological and social bases.** *J. Hlth. hum. Behav.*, 1962, 3(1), 30-31.—A nationwide quota-controlled sample of 2970 was interviewed concerning grave illnesses and health agencies. 6 diseases, including cancer, were rated on a 5-point anxiety scale and the Ss were questioned about their opinions and background. Among the results were the following mean anxiety ratings: cancer, 72; polio, 58; cerebral palsy, 52; arthritis, 50; birth defects, 46; tuberculosis, 38. Moreover, level of education correlated negatively with fear as did possession of adequate community medical resources. However, acquaintance with victims breeds apprehension, as does intimate knowledge about a disease. Other findings and the psychodynamics of anxiety are outlined.—L. A. Ostlund.

1334. Yampey, Nasim. **Ansiedades basicas en la parturienta.** [Basic anxieties in parturition.] *Acta neuropsiquiat. Argent.*, 1961, 7(4-5), 269-272.—The characteristic fears in women about to give birth are analyzed. The principal themes are: (a) fear of death during delivery, (b) fear of the delivery itself, (c) fears referred to the child, and (d) fear or con-

flict in regard to the pregnancy. These fears are ascribed to an emotional immaturity and an inadequate preparation of these women. The presence of the husband during the delivery is recommended.—*W. W. Meissner.*

Defenses

1335. Byrne, Donn, & Holcomb, John. (U. Texas) **The reliability of a response measure: Differential recognition-threshold scores.** *Psychol. Bull.*, 1962, 59(1), 70-73.—In studies of perceptual defense where the dependent variable has been differential thresholds for emotionally toned vs. neutral stimulus materials, little attention has been given to the internal consistency of such measures. A study is reported which suggests that the internal consistency may be very low.—*W. J. Meyer.*

1336. Clausman, Raymond Joseph. (Michigan State U.) **Subception as a veridical process and perceptual defense as avoidant and vigilant behavior.** *Dissert. Abstr.*, 1961, 21(11), 3521-3522.—*Abstract.*

1337. Eagle, Morris N. (New York U.) **The effects of subliminal stimuli of aggressive content upon conscious cognition.** *Dissert. Abstr.*, 1961, 21(12), 3849.—*Abstract.*

1338. Feshbach, S. (U. Pennsylvania) **The stimulating effects of a vicarious aggressive activity.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 381-385.—Previous research had demonstrated the reductive as well as the stimulating effect of aggressive activity upon feelings of aggression. To explain this inconsistency, it was herein assumed that unless the original hostile intent was aroused at the time of vicarious aggressive activity, reduction in feelings of hostility would not occur. Measurement of aggressive feelings was in terms of responses in a word association test and an attitude questionnaire. Exposure to personal insult and a film depicting aggressive activity interacted to produce less manifest hostility than groups exposed to a neutral film. The Ss' answers to the projective were different from these on the more structured test; suggested the inhibitory presence of guilt.—*G. Frank.*

1339. Forrest, D. W., & Lee, S. G. (Bedford Coll., U. London, England) **Mechanisms of defense and readiness in perception and recall.** *Psychol. Monogr.*, 1962, 76(4, Whole No. 523), 28 p.—An experimental pilot study followed by the "main experiment" on the role of perceptual defense as a repressive process. In both studies Ss were British women undergraduates, ranging in age from 18 to 21, drawn from a college for women. Use was made of a series of graphic figures of simple construction, exposed tachistoscopically; the Ss reported both what they received and what they later remembered. This behavior was studied from the standpoint of the material's unique motivational significance to the individual by using Edward's Personal Preference Schedule, Murray's Need Questionnaire, and a projective test (based on projection of imagined scene from a blank card) as initial criteria of need. In general, the findings supported the conclusion that strong conscious needs produce a sensitization effect to illustrations related to them. On the other hand, no evidence was obtained that perceptual defense is a repressive process.—*M. A. Seidenfeld.*

1340. Haas, Kurt. (Pennsylvania State U.) **A learning theory explanation of perceptual defense.** *Dissert. Abstr.*, 1961, 22(1), 332.—*Abstract.*

1341. Luborsky, L., & Shevrin, H. **Forgetting of tachistoscopic exposures as a function of repression.** *Percept. mot. Skills*, 1962, 14, 189-190.—Are the correlates of the forgetting of fleeting impressions (after a day's delay) consistent with the explanation that defensive repression is in operation? This question was posed in the context of a replication of one of Poetzl's experiments and answered with a cautiously phrased affirmative.—*W. H. Guertin.*

1342. Mangan, G. L. **Generalisation of perceptual vigilance and defence.** *Percept. mot. Skills*, 1962, 14, 171-178.—Gradients of generalization for both vigilance and defence were clearly demonstrated, with the curves showing a marked similarity. Recognition under defence conditions was less efficient than under vigilance conditions, indicating some sort of perceptual delay mechanism. It is hypothesized that the very severe level of shock used under defence conditions resulted in a general state of arousal and, consequently, more efficient recognition of all stimuli; and that the delay in recognition of the test figures, i.e., the perceptual defence effect, was due to summation of arousal and anxiety occasioned by initial misperceptions, producing perceptual inhibition.—*W. H. Guertin.*

1343. Rosen, V. H. **The relevance of "style" to certain aspects of defence and the synthetic function of the ego.** *Int. J. Psycho-Anal.*, 1961, 42(4-5), 447-457.—The view is proffered that an individual's style of artistic production and of ordinary social communication reflects his peculiar personal synthesis of the content presented through various media.—*G. Elias.*

1344. Swanson, Guy E. (U. Michigan). **Determinants of the individual's defenses against inner conflict: Review and reformulation.** In John C. Glidewell (Ed.), *Parental attitudes and child behavior* (see 37: 913). Pp. 5-41.—An examination of the research literature lends support to the view of defenses which sees them as aspects of social roles. Such defensive behaviors are seen as shifting as the social situation changes thus providing a framework within which such behaviors can be experimentally manipulated.—*W. J. Meyer.*

1345. Taylor, J. R., & Mangan, G. L. **Perceptual learning and verbal meaning.** *Percept. mot. Skills*, 1962, 14, 223-229.—A pre- and posttraining comparison of responses of 38 Ss on the Semantic Differential indicated that changes in verbal meaning can accompany changes in perceptual organization (vigilance and defence) produced by electric-shock punishment.—*W. H. Guertin.*

1346. Veldman, D. J., & Worchel, P. (U. Texas) **Defensiveness and self-acceptance in the management of hostility.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 319-325.—It was predicted that degree of self-acceptance (SA) and defensiveness (D) interact to influence the expression of hostility. It was hypothesized that Ss with low D and high SA (the adjustment) would express strongest feelings of anger with little anxiety associated with feelings of anger, while the high D/high SA person (the repressive) would express least anger, and the low D/low SA person (the anxious) would reveal high aggression-anxiety.

Degree of SA was predicted to be inversely related to displacement of hostility. Ss (college students) were exposed to a frustrating situation (failure in a test situation with concomitant insult). The results generally supported the hypotheses.—G. Frank.

1347. Wallach, Michael A., Green, Leonard R., Lippsitt, Paul D., & Minehart, Jean B. (Massachusetts Inst. Technology) **Contradiction between overt and projective personality indicators as a function of defensiveness.** *Psychol. Monogr.*, 1962, 76(1, Whole No. 520), 23 p.—120 1st-grade girls were measured on a defensiveness scale. They were also studied to determine social interaction versus social isolation (through a sociometric instrument) and graphic constriction versus expansiveness (on the basis of performance on individually administered drawing tasks of fixed time length). The investigators tested primarily the hypothesis that "among defensive subjects, those with extensive social ties should be more constricted graphically than those who are socially isolated; while among non-defensive subjects, those with extensive social ties should be more expansive graphically than those who are socially isolated." This was confirmed beyond the .001 level. Repetition showed that performances were highly reliable. Age, socioeconomic status, general intelligence, and verbal response productivity were found to be unrelated to constriction-expansiveness.—M. A. Seidenfeld.

1348. Weintraub, Walter, & Aronson, H. (U. Maryland, Baltimore) **The application of verbal behavior analysis to the study of psychological defense mechanisms: Methodology and preliminary report.** *J. nerv. ment. Dis.*, 1962, 134(2), 169-181.—N. H. Pronko.

1349. Worchel, P. (U. Texas) **Status restoration and the reduction of hostility.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 443-445.—"The present study reports positive results on a test of the implications of a 'threat' theory of hostility, namely, that hostility is reduced by status restoration. Essentially, the experiment deals with techniques designed to restore the status or the integrity of the S, who has been subjected to the hostile arousing conditions, without permitting expression of aggression (catharsis or communication)."—G. Frank.

• PSYCHOANALYTIC THEORY

1350. Bettelheim, Bruno. (Sonia Shankman Orthogenic School) **The informed heart: Autonomy in a mass age.** Glencoe, Ill.: Free Press, 1960. x, 309 p. \$5.00.—The book is concerned with man's efforts to find meaning in life and maintain personal identity in crises. It describes transitions in the author's thoughts (as the result of his experiences as a Jewish prisoner-of-war in World War II German concentration camps) on the adequacy of psychoanalysis as a personality theory and a therapeutic method.—C. H. Miley.

1351. Bowlby, John. **Ethologisches zur Entwicklung der Objektbeziehungen.** [Ethological approach to the development of object relationships.] *Psyche, Stuttgart*, 1961, 15(9), 508-516.—Ethological research provides psychoanalysis as an empirical science with a variety of new concepts for testing. It seems possible that many neurotic and psychotic symptoms among humans represent "displacement

reactions" on a presymbolic level of functioning. Though this creates difficulties for many of the symbolic oral formulations of psychoanalysis, such an hypothesis is in accord with Freud's view of psychoanalysis as based on study of "the psychological concomitants of biological processes." (English version published in *Int. J. Psycho-Anal.*, 1960, 41, 313-317.)—E. W. Eng.

1352. Burchard, Edward M. L. (Queens Coll., Flushing) **The evolution of psychoanalytic tasks and goals: A historical study of Freud's writings on technique.** *Psychiatry*, 1958, 21, 341-357.—The gradual evolution of Freud's ideas about therapeutic technique is traced through his writings from 1895 to 1937. Attention is called to his changing concepts of technique; suitability for analysis of various types of disorder; uses of dream interpretation, transference and countertransference; goals of therapy; etc. The basis for almost every suggested modification of orthodox procedure can be found in germinal form in Freud's own writings. His final position of therapeutic nihilism is seen as the inevitable outcome of the clash between the restrictions of libido theory and his exalted therapeutic aspirations.—Author abstract.

1353. Dry, Avis M. (Leeds, Great Britain) **The psychology of Jung: A critical interpretation.** (London, England: Methuen, 1961. xiv, 329 p. \$6.00.—The 1st 5 chapters treat historically the development of Jung and his work. Chapters 6 through 9 discuss Jungian therapy, Jung's critique of Freud, religion, and changes in Jung's work. Chapter 10 elaborates on the social background in which Jungian psychology has been developed. Social and historical contingencies are emphasized throughout the book. (9-p. bibliogr.)—T. F. Naumann.

1354. Kaufman, I. Charles. **Instinkt, Energie und Trieb.** [Instinct, energy, and drive.] *Psyche, Stuttgart*, 1961, 15(9), 494-507.—English version published in *International Journal of Psycho-Analysis* (see 36: 1HM18K).—E. W. Eng.

1355. Klauber, John. **Freuds Ansichten zur Religion aus der heutigen Sicht.** [The present status of Freud's views on religion.] *Psyche, Stuttgart*, 1962, 16(1), 50-57.—Religion can be understood as the attempt to achieve inner harmony with the parental images no less than to retain childhood dependency. But psychoanalysis, by its scientific and reductive emphasis, maintains its distance from religious concerns. (English version published in *Synagogue Rev.*, 1960 (May), 34.)—E. W. Eng.

1356. Koff, R. H. **A definition of identification.** *Int. J. Psycho-Anal.*, 1961, 42, 362-370.—A review of different definitions of identification found in the literature plus the author's definition. The author emphasizes that identification refers to a family of concepts, many of which differ substantially from each other.—G. Elias.

1357. Krapf, E. E. **The concepts of normality and mental health in psycho-analysis.** *Int. J. Psycho-Anal.*, 1961, 42(4-5), 439-446.—G. Elias.

1358. Kubie, Lawrence S. (Sheppard & Enoch Pratt Hosp., Towson, Md.) **The fallacious misuse of the concept of sublimation.** *Psychoanal. Quart.*, 1962, 31, 73-79.—"Evidently the most striking thing about the phenomenon which has been called sub-

limation is the fact that it does not sublimate anything in any recognizable form; therefore, the concept has no validity in relation to the dynamics or fate of the unconscious conflicts with which men struggle. . . the question is why do expressions of unconscious conflicts in forms which are socially valuable, creative, or even beautiful leave unaltered both the unconscious conflicts from which they derive and their destructive potentials?"—J. Z. Elias.

1359. Kuiper, Pieter C. *Betrachtungen über die psychoanalytische Technik bei der Behandlung neurotischer Patientinnen*. [Observations on psychoanalytic technique in the treatment of neurotic female patients.] *Psyche, Stuttgart*, 1962, 15 (11), 651-668.—"Phenomenology and psychoanalysis are often played off against each other. But the difference in method can be accepted and the phenomenological principle followed, namely, by adhering closely to the patient's experience. If this is not done the first condition for psychoanalytic treatment is missing, the contact between patient and therapist. And theory that should have been an aid to therapy becomes a barrier between analyst and analysand."—E. W. Eng.

1360. Lagache, Daniel. *Pouvoir et personne*. [Power and personality.] *Evolut. psychiat.*, 1962, 27(1), 111-119.—"Considering the importance of power and of sado-masochistic trends in social life and interpersonal relationships, one asks what is their impact on the development and structuration of personality. The emphasis is put on the so-called 'opposition period,' on the conflict of requests between the child and the parents, on the mechanism of the identification with the aggressor. The differentiation of the Ego and the alter Ego, the development of a true interpersonal relationship implies not the abolishment but the management of narcissistic and sado-masochistic trends." (English summary)—L. A. Ostlund.

1361. Lerner, Marcelo. *Psicoanálisis e hipnoanálisis: Breve estudio comparativo*. [Psychoanalysis and hypnoanalysis: A brief comparative study.] *Acta neuropsychiat. Argent.*, 1961, 7(4-5), 283-289.—Points of comparison: time of treatment, applicability, analytic range, and recovery of traumatic memories, access to the unconscious, influence on psychopathic personalities, localization of the analyst's imago in the patient's psyche, and psychosomatic action. Hypnoanalysis is the instrument of choice in neuroses, psychosomatic illnesses, and some psychoses. 5 cases are reported.—W. W. Meissner.

1362. Meynard, Benjamin. *The nature of ego: A study*. New York: Philosophical Library, 1962. 211 p. \$4.50.—16 chapters are devoted to a philosophically oriented study in depth of the ego, the result of "nearly thirty years of reading and meditation." The concepts of James, Jung, and Ouspensky provide the frame of reference. The ego is analyzed according to its relationships to other phenomena, such as attitudes, consciousness, etc., as well as its multiplicity, power, and operation. Explanatory notes and references conclude each chapter. The final chapter suggests that, given certain conditions, the ego may function as an evolutionary tool.—L. A. Ostlund.

1363. Rado, Sandor. *Psychoanalysis of behavior: Collected papers. Vol. 2: 1956-1961*. New York: Grune & Stratton, 1962. vii, 196 p. \$6.50.—

This volume is a collection of 19 short papers, written from the author's theoretical viewpoint of "adaptation psychodynamics." Discussed are selected problems of psychopathology, psychotherapy, and psychoanalytic education.—H. H. Strupp.

1364. Salzman, Leon. (Georgetown U.) *Developments in psychoanalysis*. New York: Grune & Stratton, 1962. 301 p. \$7.75.—The book presents some of the developments in psychiatric and psychoanalytic theory that have grown out of Freud's original contributions. It deals largely with the later innovations which were more concerned with the development of ego theory—from those who offered a consistent and integrated theory of personality (Horney, Sullivan) to those who elaborated certain aspects of Freud's theory (Rado, Robbins, Ferenczi). It includes chapters on sex, female psychology, homosexuality, love, hostility and depression, masochism, and therapy.—V. Sanua.

1365. Stollreiter-Butzon, Leonie. *Über die Epilepsie des Fürsten Myschkin*. [The epilepsy of Prince Myshkin.] *Psyche, Stuttgart*, 1961, 15(9), 517-531.—The principal figure of Dostoevsky's *The Idiot* shows most of the characteristic features of the epileptic personality, and was probably modelled after the writer's own experiences.—E. W. Eng.

1366. Tidd, Charles W. *Ethologie und Psychoanalyse*. [Ethology and psychoanalysis.] *Psyche, Stuttgart*, 1961, 15(9), 487-493.—English version published in *International Journal of Psycho-Analysis* (see 36: 1HM8T).—E. W. Eng.

1367. Whyte, Lancelot Law. *The unconscious before Freud*. Garden City, N. Y.: Doubleday, 1962. 211 p. \$.95 (paper).—A paperback edition of the 1960 book.—E. Y. Beeman.

1368. Winnik, H. Z. *Bemerkungen zu einem thanatophilen Aspekt des Masochismus*. [Comments on a thanatophilic aspect of masochism.] *Psyche, Stuttgart*, 1962, 15(11), 641-650.—3 illustrative cases of masochism are presented in which the longing for fulfillment was prominent. Behind the search for suffering lay an unconscious defense, the denial of suffering through mobilization of the remnants of infantile omnipotence feelings. It was as if nothing could befall the ego, and as if death were not an annihilation, but a fulfillment.—E. W. Eng.

1369. Wisdom, J. O. *Ein methodologischer Versuch zum Hysterierproblem*. [A methodological essay on the problem of hysteria.] *Psyche, Stuttgart*, 1962, 15, 561-587.—Certain difficulties in Freud's theoretical explanations of hysterical symptoms can be overcome if it is hypothesized that there is a sadistic attack on the inner maternal part-object beneath the well-developed edipal phallic formation. To describe this structure more precisely it is helpful to distinguish between "orbital" and "nuclear" introjects. Feeling is directed to the former, while the person feels with the latter.—E. W. Eng.

1370. Wittenberg, Rudolph. *Common sense about psychoanalysis*. Garden City, N. Y.: Doubleday, 1962. 216 p. \$3.95.—A psychoanalyst seeks to answer in layman's language the questions most often asked him about his work. "What is psychoanalysis? What goes on in analysis? What about the patient-family relationships during analysis? Is analytic therapy effective with children and adolescents? How long does analysis usually take? Why does it

cost so much? What should analysis do for a person? Should everyone be analyzed if he can? How does a person get to be a psychoanalyst? How can you evaluate the competency of an analyst?"—C. H. Miley.

PHYSIOLOGICAL CORRELATES

1371. Hokanson, J. E., & Shetler, S. (Florida State U.) **The effect of overt aggression on physiological arousal level.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 446-448.—Ss were exposed to frustrating conditions involving frustrators of high and low status, with or without an opportunity to give the frustrator an electric shock. Tension level (TL) was measured by systolic blood pressure. TL increased under conditions of frustration; returned to prefrustration level when S was able to retaliate against low-status frustrator, with or without retaliation against high-status frustrators, and remained high only when S was not able to express aggression against low-status frustrators. The results suggested that under certain conditions overt aggression was tension reducing; under others, TL may be reduced by other behavior, e.g., withdrawal.—G. Frank.

1372. Murphy, George E., Kuhn, Nobuko Obayashi, Christensen, Roger F., & Robins, Eli. (Washington U. School Medicine, St. Louis, Mo.) **"Life stress" in a normal population: A study of 101 women hospitalized for normal delivery.** *J. nerv. ment. Dis.*, 1962, 134(2), 150-161.—"One hundred and one postpartum women, unselected for psychiatric or other illness, were interviewed concerning the possible occurrence of 27 potentially stressful life experiences within the year prior to hospitalization for delivery. The group was composed of 34 white private patients, 25 white ward patients, five Negro private patients and 37 Negro ward patients. A total of 2.8 events of the kinds studied had occurred in the lives of these individuals within the one-year period. The range was from no events to eight. Eighty-nine per cent of the Ss reported at least one. A remarkable similarity was found in the frequency and kinds of experiences among the groups, despite the differences in the racial and sociologic composition of the groups. Some possible effects of pregnancy on the findings have been discussed."—N. H. Pronko.

1373. O'Connell, Desmond D., & Lundy, Richard M. (VA Hosp., Wood, Wis.) **Level of aspiration in hypertensive cardiac patients compared with nonhypertensive cardiac patients with arteriosclerotic heart disease.** *J. consult. Psychol.*, 1961, 25(4), 353-359.—"The hypertensive group 'arrange' for repeated failure by consistently setting excessively high goals." Level of aspiration was based on Minnesota Rate of Manipulation Test.—E. R. Oetting.

1374. Wiener, Gerald. (Johns Hopkins U.) **Psychologic correlates of premature birth: A review.** *J. nerv. ment. Dis.*, 1962, 134(2), 129-144.—An outline and summary of the results of the English and French literature on psychological correlates of premature births.—N. H. Pronko.

THERAPY & GUIDANCE

1375. Bachrach, Arthur J. (Ed.) **Experimental foundations of clinical psychology.** New York:

Basic Books, 1962. xii, 641 p. \$10.00.—Part I notes experimental tradition and clinical psychology (R. I. Watson), experimental bases of clinical judgment (W. A. Hunt & N. F. Jones), and personality assessment (I. A. Berg & H. E. Adams). Part II offers related discussions of learning theory (R. F. Hefferline), effects of infantile experience (S. Levine), operant techniques (M. Sidman), small group research (L. Petruccio), cognitive dissonance (L. Festinger & D. Brame), and perception (I. Goldiamond). Part III concerns psychophysiology, particularly emotional behavior (J. V. Brady), activation (R. B. Malmo), psychopharmacology (P. B. Dews), and the neuropsychology of Sigmund Freud (K. H. Pribram). Part IV cites experimental bases of psychotherapy, including noncontent interview research (J. D. Matarazzo), verbal conditioning (J. Greenspoon), reciprocal inhibition (J. Wolpe), and patient-doctor relations (H. H. Strupp). The introduction and an integrative concluding chapter are by A. J. Bachrach.—H. P. David.

1376. Bigelow, Newton, & Sainz, Anthony. (Marcy State Hosp., N. Y.) **Pitfalls in psychiatric research.** *Amer. J. Psychiat.*, 1962, 118(10), 889-896.—In the field of psychiatry, as in other fields, scientific investigations and experimentations may harbor errors in discovery, verification, and communication. Various controls that may be used to circumvent these errors are discussed.—N. H. Pronko.

1377. Brill, Norman Q. (Ed.) **Psychiatry in medicine.** Los Angeles, Calif.: Univer. Calif. Press, 1962. xvi, 195 p. \$3.95.—Greater awareness of psychosomatic relationships emphasizes a need for psychiatric training for general practitioners. 10 contributors offer guidance towards understanding and treatment of emotional disorders. Guidelines rather than specifics of diagnosis and treatment are stressed.—R. Tyson.

1378. Leigh, Denis. (Bethlem Royal & Maudsley Hosp., London, England) **The historical development of British psychiatry. Vol. 1. 18th and 19th centuries.** London, England: Pergamon, 1961. xiv, 277 p. \$10.00.—Written to present a picture of the growth of ideas in British psychiatry. In this volume of the trilogy the author deals with (a) the use of psychiatry as a specialist technique during the 18th century and (b) the results which flowed from this during the 1st ½ of the 19th century. The care and treatment of the mentally sick passed into secular hands, and it was from this that modern psychiatry developed. It is this development with which the book is concerned. The method of approach is biographical. (26 ref.)—S. B. Coslett.

1379. Swerdloff, Bluma. (Columbia U.) **The predictive value of the admissions interview: A search for the psychodynamic factors related to changes in the patient and his situation.** *Dissert. Abstr.*, 1961, 21(10), 3169.—Abstract.

MEDICAL THERAPIES

1380. deMuralt, G. (University Gynecological Hosp., Berne, Switzerland) **The prophylaxis of kernicterus.** *Develpm. Med. child Neurol.*, 1962, 4(2), 133-146.—Various causes of kernicterus and the effectiveness of different preventive treatments of the mothers are determined. "Kernicterus is en-

tirely preventable." (45-item bibliogr.)—*T. E. Newland.*

1381. **Kutner, Bernard, & Gordon, Gerald.** (Albert Einstein Coll. Medicine) **Seeking care for cancer.** *J. Hlth. hum. Behav.*, 1961, 2(3), 171-178.—The goal was to study the relationship of patient delay in seeking care for cancer, to the presence of a cancer danger signal. From the 808 Ss chosen by area probability sampling in New York City, 640 illness histories were obtained. The preliminary findings were (a) delay was most clearly associated with lack of education, (b) there was no sex difference in delay, and (c) there was a greater frequency of reported cancer symptoms among women than men.—*L. A. Ostlund.*

1382. **Porteus, S. D., & Diamond, A. L.** (U. Hawaii) **Porteus Maze changes after psycho-surgery.** *J. ment. Sci.*, 1962, 108, 53-58.—Decline in use of radical surgery for psychiatric symptoms has stopped investigation of loss of intellectual functions from such operations, and reassessment of the experimental literature now suggests that the assumption of transient loss only may be mistaken and that some gains to earlier levels of function following operation were partially practice effects in use of the function. Language is practiced even in old age and resists deterioration more than functions which are unpracticed. When maze tests were used with equivalent forms, loss seemed to persist—especially in the function (planning ability) tapped by the mazes.—*W. L. Wilkins.*

1383. **Yacorzynski, G. K., Atkinson, Arthur J., Cohen, Jerome, & Shuffelbarger, Forrest G.** (Northwestern U. Medical School) **Investigation of carbon dioxide therapy.** Springfield, Ill.: Charles C Thomas, 1962. 313 p. \$9.75.—A detailed, clinical-experimental investigation of carbon dioxide therapy is reported in relation to patients with ulcerative colitis and spastic colons. A comprehensive evaluation is included of the historical and procedural aspects of this type of treatment, with an analysis of results on psychological testing, psychiatric examination, and symptomatic comparative study. Psychotherapeutic considerations and the psychodynamics of this therapeutic modality are well treated.—*M. V. Kline.*

Drug Therapy

1384. **Glick, Burton S., & Margolis, Reuben.** (State U. New York, Medical Center, Brooklyn) **A study of the influence of experimental design on clinical outcome in drug research.** *Amer. J. Psychiat.*, 1962, 118(12), 1087-1096.—"The present paper consists of an appraisal of the research designs involved in 34 published papers dealing with the chlorpromazine treatment of chronic, hospitalized schizophrenics, in order to determine if the varying designs, with particular reference to "blind," placebo-controlled conditions, exerted any differential effect on ratings of clinical improvement." Among other findings there was a relationship between degree of "blindness" and percentage improvement, being lower for the double blind.—*N. H. Pronko.*

1385. **Hollister, Leo E., Degan, Roger O., & Schultz, S. Donald.** (VA Hosp., Palo Alto, Calif.) **An experimental approach to facilitation of psychotherapy by psychotomimetic drugs.** *J. ment. Sci.*, 1962, 108, 99-100.—4 patients treated with pla-

cebo or 2 doses of psilocybin were rated on a 25-item scale of desiderata of psychotherapeutic interviews. While no great change in total scores occurred, there was some greater tractability of patients under the drug; however, ability to focus on and talk about problems or gain insight seemed to decrease. 18 patients treated with 3 different drugs showed some selective changes enhancing introspection.—*W. L. Wilkins.*

1386. **Loranger, Armand W., & Prout, Curtis T.** (White Plains, N. Y.) **A controlled evaluation of deanol and benactyzine-meprobamate.** *New England J. Med.*, 1962, 266, 1073-1078.—The staff was informed that 60 depressed patients were to be treated with a new antidepressant drug, ST50. Actually, 20 patients received deanol (deaner), 20 received meprobamate combined with benactyzine (deprol), and 20 received a placebo. The 3 groups of patients were equated initially by sampling and statistical procedures. Changes in behavior were measured by rating devices completed by nurses, psychiatrists, and patients. During the 6 weeks of treatment the patients who received the drugs did not improve more than the patients who received the placebo.—*Author abstract.*

1387. **Muller, Bruce Paul.** (Columbia U.) **Personality correlates of the placebo reaction.** *Disser. Abstr.*, 1961, 21(12), 3855.—*Abstract.*

1388. **Nash, Harvey.** (Northwestern U. Medical School) **The double-blind procedure: Rationale and empirical evaluation.** *J. nerv. ment. Dis.*, 1962, 134(1), 34-47.—An attempt is made to resolve conflicting attitudes concerning the practicability and desirability of the double-blind procedure. A logical analysis is first made of this procedure followed by an illustration provided by a specific study. It is concluded that the double-blind technique has both potentialities and limitations and that its potentialities deserve further exploration.—*N. H. Pronko.*

1389. **Oswald, Ian.** (U. Edinburgh, Scotland) **Induction of illusory and hallucinatory voices with considerations of behavior therapy.** *J. ment. Sci.*, 1962, 108(453), 196-212.—7 patients undergoing aversion therapy, with drugs, were exposed to repetitive verbal stimulation by means of a loop of magnetic tape on which was recorded materials of personal significance to the patient and his symptoms. This technique induced misperception in some and frank hallucinosis in others, with transitory depersonalization and derealization also occurring.—*W. L. Wilkins.*

1390. **Pilkington, T. L.** (Cranage Hall Hosp., Cheshire, England) **A report on "tofranil" in mental deficiency.** *Amer. J. ment. Defic.*, 1962, 66(5), 729-732.—"Tofranil" was administered to 39 mentally defective patients of all ages with behavior disturbances. They were clinically divided into "affectives" and "nonaffectives." Over ½ of the former responded favorably. The symptoms of all the schizophrenics, mainly in the "nonaffective" group, became more obvious. It was felt that this may be a valuable diagnostic use of the drug.—*V. S. Sexton.*

1391. **Pincherle, M., & Morgante, R.** **Trattamento delle sindromi depressive con fenelzina (nardil).** [Treatment of depressive syndromes with nardil.] *Arch. Psicol. Neurol. Psychiat.*, 1962, 23(1), 45-59.—Treatment of 30 cases of depressive syn-

dromes with Nardil produced good or moderate results in $\frac{3}{4}$ of cases, without side-effects. This drug is particularly effective in conjunction with sedatives for treatment of depressed outpatients.—*L. L'Abate.*

1392. Raskin, Allen. (VA, Washington, D. C.) **A comparison of acceptors and resisters of drug treatment as an adjunct to psychotherapy.** *J. consult. Psychol.*, 1961, 25(4), 366.—On 40 personality, socioeconomic, and attitudinal variables, and on therapists' judgments after 8 weeks of treatment, resisters reluctance was not due to drug side effects but "apparently provided a convenient focal point for the hostile and aggressive impulses."—*E. R. Oetting.*

1393. Speranskii, G. N., & Pratushevich, YU. M. (Acad. Medical Sciences SSSR) **Blokada (farmakologicheskoe vyklyuchenie) retikulyarnoĭ formatsii mozgovogo stvola rebenka i ee prekraschenie kholodnyĭm vozdeĭstviem.** [Blocking (pharmacological exclusion) of the reticular formation of the brain stem and its restoration by a cold agent.] *Dokl. Akad. Nauk SSSR.*, 1961, 141(6), 1518-1521.—The authors observed that blocking of the adreno- and M-cholinoreactive systems of brain stem synapses by adenylytic propazin and cholinolytic amazil produced a general tranquilizing effect on children sufficient for minor operations such as tonsilectomy. However, major operation require too large doses if the drugs are administered separately. It was hypothesized that simultaneous blocking across both cholinergic and adrenergic structures in the synapses would produce a deeper tranquilizing effect with smaller doses. Simultaneous dosing with both the above drugs confirmed the hypothesis. It was further found possible to negate the effects of the drugs by application of ice to the face and head regions. EEG, PGR, and breathing rates served as indices of the effect of drugs.—*H. Pick.*

1394. Vestre, N. D. (U. Minnesota) **The effects of thorazine on learning and retention in schizophrenic patients.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 432-435.—The effect of thorazine upon learning in schizophrenics was studied by the use of a word association task. The performance of patients receiving varying dosages of thorazine (from 100 to 800 mg/day) were compared with patients who were on placebo. Thorazine was seen to affect learning and retention negatively.—*G. Frank.*

1395. Winick, C. **The diffusion of an innovation among physicians in a large city.** *Sociometry*, 1961, 24, 384-396.—Approximately $\frac{1}{3}$ of the physicians in a city of over $\frac{3}{4}$ of a million people were personally interviewed regarding their interpersonal network and their knowledge and use of a new prescription drug. Unlike earlier studies sociometric choice did not appear to be an important determinant of new drug use. Speculations were advanced with respect to differences between small and large towns in the degree to which personal contacts are important correlates of drug innovations.—*H. P. Shelley.*

Shock Therapy

1396. Mandel, Nathan Gary. (U. Minnesota) **An evaluation of sociological, psychological, and physiological post-treatment adjustment of mental patients treated with regressive electric shock therapy.** *Dissert. Abstr.*, 1961, 21(12), 3874.—*Abstract.*

1397. Pollack, Max; Kahn, Robert L., Karp, Eric, & Fink, Max. (Hillside Hosp., Glen Oaks, N. Y.) **Tachistoscopic perception after induced altered brain function: Influence of mental set.** *J. nerv. ment. Dis.*, 1962, 134(5), 422-430.—"The present study examines the changes in the perception of pseudo-isochromatic figures associated with diffuse cerebral dysfunction induced by convulsive therapy. The observed changes in visual performance are related to 'mental set' and to electroencephalographic measures."—*N. H. Pronko.*

PSYCHOTHERAPY

1398. Ahmad, Farrukh Zahur. (Stanford U.) **Aspects of psychotherapy related to psychotherapists' responses to dependency.** *Dissert. Abstr.*, 1961, 21(11), 3519.—*Abstract.*

1399. Astigueta, Diego. (1143 5th Ave., NYC) **Psicoterapia psicoanaliticamente orientada.** [Psychoanalytically oriented psychotherapy.] *Acta neuropsiquiat. Argent.*, 1961, 7(4-5), 279-283.—Differences between psychoanalysis and analytically oriented therapy are discussed. The case of a patient presenting symptoms of hiccoughs and bronchial asthma is used as an illustration. The patient turned out to be psychotic, so that the technique consisted in lending the patient the therapist's ego as a psychological prosthesis. The pointing out of reality was essential in obtaining limited results after 2 years of therapy.—*W. W. Meissner.*

1400. Boyer, L. B. **Provisional evaluation of psycho-analysis with few parameters employed in the treatment of schizophrenia.** *Int. J. Psychoanal.*, 1961, 42(4-5), 389-403.—Reports on the successful treatment, by conventional psycho-analytical techniques, of 13 nonhospitalized patients who had been diagnosed schizophrenic.—*G. Elias.*

1401. Callieri, B., & D'Agostino, N. **Antropologia esistenziale e psicoanalisi di fronte al sentimento di colpa.** [Existential anthropology and psychoanalysis dealing with guilt feelings.] *Arch. Psicol. Neurol. Psichiat.*, 1962, 23(1), 17-18.—The wide range of possibilities encompassed by existential psychotherapy allows a more individualized approach to guilt feelings than psychoanalysis.—*L. L'Abate.*

1402. de Hojman, Raquel K., & Schust, Jaime P. **Grupos terapéuticos paralelos de hijos y madres.** [Parallel therapy groups for sons and mothers.] *Acta neuropsiquiat. Argent.*, 1961, 7(3), 186-188.—An attempt to organize a more integral therapy of the family group. The sick child is the sick representative of a family group. The mother is included in the therapeutic plan because she is the most accessible member of the family: it is usually the mother who brings the boy for treatment.—*W. W. Meissner.*

1403. Feibleman, James K. (Tulane U.) **The stressed conditioning of psychotics.** *J. Psychol.*, 1962, 53(2), 295-299.—An extension of existing techniques in the treatment of certain types of psychoses is proposed. The therapy will consist of 2 separate phases. In the 1st stage, the delusional system is extinguished by means of noxious stimulation accompanying the interviews. In the 2nd stage, a positive set of beliefs is instilled under the technique of stressed conditioning. Stressed conditioning is the

imposition of beliefs at a deep level of analysis carried out under stress.—*Author abstract.*

1404. Garfinkel, Elisa. (U. Nacional, Buenos Aires) *Técnicas psicoterápicas utilizadas en el tratamiento de las psicosis infantiles.* [Psychotherapeutic techniques utilized in the treatment of infantile psychoses.] *Acta neuropsiquiat. Argent.*, 1961, 7(3), 199-201.—Newer techniques tend to suppress morbid symptoms and improve the child's interpersonal relations, but this is not a simple transposition of the approaches developed with adults. The child's experience grows out of a constant interplay between his own world of fantasy and the adult world of reality. The use of symbolic realization, identification, dramatization, and direct interpretation in dealing with psychotic children is discussed.—*W. W. Meissner.*

1405. Gendlin, E. T. (U. Wisconsin) *Need for a new type of concept: Current trends and needs in psychotherapy research on schizophrenia.* *Rev. existent. Psychol. Psychiat.*, 1962, 2(1), 37-46.—". . . some of us are coming to consider the central aspects of psychotherapy as implicit, sensed and felt experiencing, and personal interaction. . . . We are tending toward . . . the kind of theory and . . . research variables which will give us a science of the concrete experiencing of interacting organisms, in terms of differentiated and defined measurements of observable variables."—*J. Lyons.*

1406. Hollender, M. H. *Prostitution, the body, and human relatedness.* *Int. J. Psycho-Anal.*, 1961, 42(4-5), 404-413.—Recounts bits from the psychoanalyses of 2 patients, both of whom had used prostitution to avoid personal relationships and to achieve a false sense of adult femininity.—*G. Elias.*

1407. Horney, Karen. (Ed.) *Are you considering psychoanalysis?* New York: Norton, 1962. vi, 257 p. \$1.65 (paper).—A paperback edition of the original 1946 publication.—*J. W. Thompson.*

1408. Langen, D. *Langfristige psychotherapie in sozial tragbarer form.* [Long-term therapy in a socially acceptable form.] *Acta psychother. psychosom.*, Basel, 1961, 9(6), 401-409.—The weekly therapeutic session with the physician plus the meeting of patients in a social club, provides the basis for time-saving procedures in lengthy therapy.—*G. Rubin-Rabson.*

1409. Lebedinskii, M. S. *Ocherki psikhoterapii.* [Essays in psychotherapy.] Moscow, USSR: Medgiz, 1959. 351 p.—The author develops a theoretical and practical text on psychotherapy based on Pavlovian principles, especially those associated with the 2nd signal system and the hypnotic state. He specifically considers psychotherapy in the waking and hypnotic states and work as a psychotherapeutic measure.—*I. D. London.*

1410. Lomas, P. *Observations on the psychotherapy of puerperal breakdown.* *Brit. J. med. Psychol.*, 1961, 34, 245-253.—2 cases illustrate the application of inpatient treatment focused on the mother-baby relationship.—*C. L. Winder.*

1411. Menninger, Karl Augustus. *Theory of psychoanalytic technique.* New York: Basic Books, 1961. 206 p. \$1.65.—First published in 1958 (see 33: 1214), this is a paperback edition.—*E. Y. Beeman.*

1412. O'Connell, Walter E. *Identification and curability of the mental hospital patient.* *J. indiv. Psychol.*, 1962, 18(1), 68-76.—"Psychotherapy with hospitalized schizophrenic patients has been tethered by treating it as the medical man's domain exclusively, by the tacit incorporation of psychoanalysis frames of thought, and by assuming the incurability of schizophrenia." Needed are more active approaches that aid the growth of humanistic identification in patients. An example is offered.—*A. R. Howard.*

1413. Primrose, E. J. R. *Psychological illness: A community study.* Springfield, Ill.: Charles C Thomas, 1962. vii, 60 p. \$3.50.—The theme of this monograph is that the treatment of neuroses can be the responsibility of the general practitioner who should be suitably trained for the purpose. The author, a general practitioner himself, describes his experiences in serving a small, relatively isolated community in northern Scotland. Over a one-year period, he studied the incidence of mental disorder in his practice and related it to the socio-economic conditions of the people and to their attitudes and values. Preventive aspects and the role of the family doctor in training disturbed human relationships of psychogenic origin are delineated.—*H. Feifel.*

1414. Wollstein, S., & Hoek, A. (University & Hadassah Hosp., Jerusalem) *Psikhoterapia bezugot.* [Psychotherapy of couples.] *Harefuah*, 1962, 62, 288-291.—Psychotherapy of married couples carried out once a week in a psychiatric outpatient department is described. In each case at least one of the couple needed psychiatric treatment; in most cases sessions in the presence of husband and wife with both of the authors gave satisfactory results. The therapy was psychoanalytically oriented. (English & French summaries)—*H. Ormian.*

Therapeutic Process

1415. Frighi, L., & Tolentino, I. (U. Rome) *Réalisation de l'ideal du moi en tant que but de la psychotherapie.* [Realization of the ideal-ego as an objective of psychotherapy.] *Acta neurol. psychiat. Belg.*, 1961, 61(10), 879-892.—During psychotherapy, the authors found it necessary to center the analysis on the confluence of libidinal assets into the ideal-ego rather than on the conflict between instinctual urges and super-ego. In most instances, they had to dig out from the unconscious and mould a new ideal-ego, from an inhibited and inadequate one. The authors acknowledge the obstacles to such psychotherapeutic orientation, but they think that in order to restore certain psychical patterns and models, this type of "pseudosublimation" is useful and advisable in several cases.—*V. Sanua.*

1416. Howe, Edmund S., & Pope, Benjamin. (U. Maryland School Medicine) *The dimensionality of ratings of therapist verbal responses.* *J. consult. Psychol.*, 1961, 25(4), 296-303.—35 psychiatrists rated 10 therapists' responses on a 40-scale semantic differential. Factor analysis shows 3 factors. Ratings on an evaluation dimension and on a dimension of precision and potency (ambiguity) are independent.—*E. R. Oetting.*

1417. Karen, Edward S., & Bertram, P. *Techniques of primitive witchcraft in modern psychotherapy.* *Acta psychother. psychosom.*, Basel, 1961, 9(6), 393-400.—Many problems are unresponsive to

conventional techniques. The techniques of primitive witch doctors can in specific cases prove effective for therapeutic transference.—G. Rubin-Rabson.

1418. Koestenbaum, Peter. (San Jose State Coll.) **The sense of subjectivity.** *Rev. existent. Psychol. Psychiat.*, 1962, 2(1), 47-64.—"Psychological and therapeutic aspects of the sense of subjectivity" are emphasized in a discussion of this central area of "the experience of feeling human"; its relevance to questions of value; and its significance for decision, will, and "the protean traits of experience." The sense of subjectivity, or the "ineffable sense that I am I," exists on various levels of experience—as identification with the body, with the psychological self, and with the transcendental ego. It is a fundamental condition for meaningful activity and may be considered as a major goal in psychotherapy.—J. Lyons.

1419. Laffal, J. (VA Hosp., West Haven, Conn.) **Changes in the language of a schizophrenic patient during psychotherapy.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 422-427.—A method of linguistic analysis (Bousfield et al, 1958) is applied to the speech of a schizophrenic patient to demonstrate the changes that have occurred in the course of psychotherapy. The analysis showed that as the patient's behavior became less disorganized, so did his speech; however, the content of his speech revealed constriction of ideation.—G. Frank.

1420. Medini, Gid'on. (Mental Health Clinic, Ramat Hen) **Haavara negdit: Temura bagisha.** [Countertransference: Change in approach.] *Dap. refuim*, 1961, 20, 481-488.—The concept of countertransference in psychoanalysis and psychotherapy is explained. Some theoretical and practical problems concerning the therapist's role as a "mirror" are discussed. This recent feature of psychopathology is connected with the moving of interest from stressing the patient's psychopathology to studying the interpersonal therapist-patient relationship. Use of countertransference in therapeutic exchanges is illustrated. (English & French summaries)—H. Ormian.

1421. Michal-Smith, Harold. (New York Medical Coll.) **Psychological factors in the therapist-patient relationship in the rehabilitation process.** *Rehabilit. Lit.*, 1962, 23(3), 66-69.—Physical handicaps often result in a variety of emotional problems. General effects are: (a) the disability has both social and emotional effects, (b) psychological gains arise as compensations for the handicap, (c) handicapped persons constitute emotional problems to others, (d) therapists may possess problems which enter into the relationship. The primary problem of anxiety causes a number of defense mechanisms. Most common are denial and transference. Recognition and acceptance of the anxiety which results from a handicap will increase ego-strength and allow growth within the rehabilitative process.—W. D. Kerr.

1422. Moser, Ulrich. **Übertragungsprobleme in der Psychoanalyse eines chronisch schweigenden Charakterneurotikers.** [Transference problems in the psychoanalysis of a chronically silent character neurotic.] *Psyche, Stuttgart*, 1962, 15, 592-624.—The patient's silence has a double meaning; it is defensive and at the same time a preverbal expression of primary identification. Problems of silence in psychoanalysis are illustrated by problems in the treat-

ment of a long term case, together with a review of the pertinent literature. (41 ref.)—E. W. Eng.

1423. Papanek, Helene. **Expression of hostility: Its value in the psychotherapy group.** *J. indiv. Psychol.*, 1962, 18(1), 62-67.—Merely to experience release is insufficient reason for expressing hostility. To be therapeutic, such expression must result in a learning experience and help to strengthen one's social feeling. One should focus on learning to express and to experience himself "in new positive ways."—A. R. Howard.

1424. Percy, Walker. **The symbolic structure of interpersonal process.** *Psychiatry*, 1961, 24(1), 39-52.—The deep ambiguity in the concept "participant observation" is traced to an equivocation of behavioral terms applied to generically different communication events. The behavioristic theory of meaning is questioned as incoherent, the generic structure of symbolic behavior is outlined, and the symbolic structure of a therapist-patient communication event is examined.—C. T. Bever.

1425. Ruesch, Jurgen. **Therapeutic communication.** New York: Norton, 1961. xv, 480 p. \$6.50.—"... therapeutic communication remains a mixture of observable facts, reportable experiences, and non-reportable emotions. Art, craft, and science are combined to help the individual maintain his own identity and sanity against the pressures of mass communication and the collective state. . . . [It] is a skill practiced by professionals in order to help people overcome temporary stress, to get along with other people, to adjust to the unalterable, and to overcome psychological blocks which stand in the path of self-realization." The book is organized into 7 parts. These are: "The Framework," "The Recognition of Disturbed Communicative Behavior," "The Doctor's Therapeutic Operations," "Long-Term Therapeutic Goals," "Therapy with the Disturbed Individual," "The Disturbed Individual and his Surroundings," and "Summary." (400 ref.)—C. J. Adkins.

1426. Schrader, George A. (Yale U.) **Interpersonal communication.** *Rev. existent. Psychol. Psychiat.*, 1962, 2(1), 65-74.—Given 2 models, subject and object, in which persons appear to themselves and to others, how can the modes be integrated in interpersonal communication? In the special case of the therapy situation, the issue is solved by orthodox analysis through a successful "de-personalization" of both participants, each coming to apprehend himself and the other in relatively objective fashion. As an alternative to this "unsatisfactory" cure, existential analysis recognizes and exploits the necessarily "complex dialectic" which underlies all human relations: that each person must always be both a role-playing "object" and an individual "subject." The solution is applicable to human communication in general.—J. Lyons.

1427. Wijsenbeck, Henricus. (Gehah Psychiatric Hosp., Petah Tikva) **Al hayahas hahadadi ben hole verofe.** [Patient-physician relationship.] *Harefuah*, 1961, 61, 307-309.—Besides the conscious relationship between physician and patient (to cure and to be cured) there is an unconscious factor. This part of the relationship (based on emotional experiences of both of them) is very important in each therapeutic situation. Therefore psychological knowledge must be a basic part of every kind of medical

training. This part of training has to be given by psychiatry departments. (English & French summaries)—*H. Ormian.*

Group Therapy

1428. Cummings, S. T., & Stock, Dorothy. (U. Chicago) Brief group therapy of mothers of retarded children outside of the specialty clinic setting. *Amer. J. ment. Defic.*, 1962, 66(5), 739-748.—Results are described of a program of brief group therapy for mothers of retarded children.—*V. S. Sexton.*

1429. Goldenberg de Antin, Luisa R. La psicoterapia colectiva racional como forma de tratamiento en los adolescentes. [Rational group psychotherapy as a form of treatment for adolescents.] *Acta neuropsychiat. Argent.*, 1961, 7(3), 204-206.—A method of group therapy is described which aims at gradually replacing elements of magical thinking by logical thinking. Its success with groups of 10-12 adolescents is discussed: it satisfies their need to communicate with others of their own age group and to separate from the family, replaces infantile with adult values, etc.—*W. W. Meissner.*

1430. Harris, Pearl, & Trotta, Frank. (Philadelphia General Hosp.) An experiment with under-achievers. *Education*, 1962, 82, 347-349.—A modified form of group therapy was undertaken in an experiment with 32 pre-adolescents. The progress of the group was reported, findings summarized, and the project evaluated. 4 students improved in their grades, 2 showed minor improvement, and 2 showed no improvement.—*S. M. Amatora.*

1431. Heckel, R. V., Froelich, R. E., & Salzberg, H. C. (VA Hosp., Augusta, Ga.) Interaction and redirection in group therapy. *Psychol. Rep.*, 1962, 10(1), 14.—Patient interactions in group therapy sessions correlated—.77 with total therapist responses and .70 with proportion of therapist redirection responses.—*B. J. House.*

1432. Kraak, Bernhard. (Ringelbachstr. 200, Reutlingen, Germany) Nichtdirektive Gruppentherapie mit Heimkindern. [Nondirective group therapy with institutionalized children.] *Z. exp. angew. Psychol.*, 1961, 8(4), 595-622.—20 children in an institution for mentally retarded children were treated in 4 groups for 6 months with nondirective psychotherapy. Compared to a matched control group, the mental and emotional development of the children was significantly improved at the end of the therapeutic period.—*W. J. Koppitz.*

1433. Locke, Norman. Group psychoanalysis: Theory and technique. New York: New York Univ. Press, 1961. ii, 253 p. \$6.50.—Though concerned with theory and technique, more space is given to the therapeutic process in action. The chapter devoted to the patient in the group leads to topics such as transference, identification, projecting dreams, fantasy, and free association. Next, there are sections for terminating the process and the selection of patients and composition of groups. A 79-page transcription and analysis of an average session is included. Differences in group dynamics and group psychoanalysis are stressed. Though the focus is on the individual who is being treated, there are many examples of simultaneous insights and beneficial inter-

action of group members. (33-item bibliogr.)—*L. A. Ostlund.*

1434. Mullan, Hugh, & Rosenbaum, Max. (New York Alcoholism Vocational Rehabilitation Project) Group psychotherapy: Theory and practice. New York: Free Press Glencoe, 1962. xvi, 360 p. \$5.95.—"Group psychotherapy is significantly different from individual therapy. . . . The self-centeredness of individual therapy without sufficient checks is done away with as group members are called upon to help and to be helped." The authors discuss: the evolution of group therapy; underlying concepts; the impact upon contemporary thought; and the therapeutic process (screening and preparing patients, overcoming resistance, organizing and administering the group, transference, countertransference, extra-therapeutic contact, crisis, and termination of contact). They describe the need for specific training of group therapists and the aims and methods of such training. Comprehensive glossary. 91-item reading list for trainees. (354 ref.)—*C. H. Miley.*

1435. Rosenberg, Israel Henry. (New York U.) An experimental investigation of some effects on stutterers of pacatal-aided group psychotherapy: A comparison of the effects on male adult stutterers of group psychotherapy with and without the tranquilizer pacatal as an adjuvant. *Dissert. Abstr.*, 1961, 21(10), 3168.—*Abstract.*

1436. Rosenthal, L., & Schamess, G. (Jewish Board Guardians) The group psychotherapy literature 1961. *Int. J. group Psychother.*, 1962, 12(2), 240-259.—155 published reports dealing with a variety of aspects of group psychotherapy are summarized.—*M. H. Lewin.*

Special Therapies

1437. Ellis, Albert. (333 W. 56th St., NYC) Reason and emotion in psychotherapy. New York: Lyle Stuart, 1962. 442 p. \$10.00.—Integrating both previously published and new material, "the pages of this book . . . outline the theory of rational-emotive psychotherapy . . . [and] present the clinician with some of the main clinical applications." Included are papers on: the origin, principles, theoretical considerations, objections to, and limitations of rational-emotive psychotherapy; comparisons with other forms of treatment; and its individual and group use with a variety of clinical and marital problems. (17-p. bibliogr.)—*H. P. David.*

1438. Frankl, Victor E. Basic concepts of logotherapy. *Confin. psychiat.*, Basel, 1961, 4, 99-109.—Logotherapy emphasizes man's will to meaning, as contrasted with the Freudian emphasis on the will to pleasure and the Adlerian emphasis on the will to power. As long as the individual seeks meaning he practices a freedom that rises above the various kinds of determinisms; viz., a social factor like the breakup of tradition or a theoretical notion like "psychic mechanism."—*E. W. Eng.*

1439. Ginott, Haim G., & Lebo, Dell. (Child Guidance Clinic, Jacksonville, Fla.) Play therapy limits and theoretical orientation. *J. consult. Psychol.*, 1961, 25(4), 337-340.—A questionnaire on limits was related to 227 play therapists' identification of themselves as nondirective, psychoanalytic, or "other." Groups differed on 14 situations but no

consistent pattern is apparent. Orientations did not differ and all used many limits.—*E. R. Oetting.*

1440. Lazarus, A. A. (U. Witwatersrand Medical School, South Africa) Group therapy of phobic disorders by systematic desensitization. *J. abnorm. soc. Psychol.*, 1961, 63(3), 504-510.—Phobic patients were placed in groups receiving either insight or desensitization (Wolpe, 1958) therapy. In approximately 20 sessions, 13 of 18 Ss treated by Wolpe's method were able to tolerate the fantasy of their phobic situation as well as to live through the experience outside of therapy without experiencing anxiety. Only 2 patients were symptom free in a comparable number of hours of insight-oriented group therapy. The 15 non-symptom-free Ss in the latter group were then placed in desensitization groups: 10 improved in 10 sessions. The implication of the results were discussed.—*G. Frank.*

1441. Levinson, Boris M. (Yeshiva U.) The dog as a "co-therapist." *Ment. Hyg., N. Y.*, 1962, 46, 59-65.—A description of the use of a dog as a catalytic agent helping children to deal with their problems. The author states that "the creation of a well-trained Canine Counseling Corps for Children might elicit snickers and sneers and charges of 'fantasying.' Nevertheless, a dog corps served this country heroically in the performance of military tasks in World War II. Why not as psychotherapeutic aides?"—*M. H. Lewin.*

1442. Messinger, S. L., Sampson, H., & Towne, R. D. (Bay Area Health Study) Life as theater: Some notes on the dramaturgic approach to social reality. *Sociometry*, 1962, 25(1), 98-110.—Questions are raised about the "dramaturgic approach" to social experience. The actor's perspective in everyday life is examined. "... we shall describe a perspective on the world and the self within it, a perspective that rends life a kind of 'theater' in which a 'show' is 'staged' . . . to show the incompatibility of this perspective with the view that persons in everyday life seem to consider 'natural,' we shall present some observations by and about mental patients taken from a recently completed study. . . . the perspective of persons who are 'on' is akin or identical to the view seemingly attributed by the dramaturgist analyst to his subjects, that is, to persons plying their routine rounds of daily activities."—*H. P. Shelley.*

1443. Pikler, Andrew G. Music as an aid in psychotherapy. *Acta psychol., Amsterdam*, 1961, 18(5), 317-331.—Musical exposure as a restoring vector could be tailored to various situations in psychodynamics to exploit its potential in evoking semantic-associative responses. A musical equivalent for conflict and catharsis is needed for the individual case. A reactivity test preceding music therapy is feasible.—*G. Rubin-Rabson.*

1444. Rogers, Carl, & Kinget, G. Marian. (U. Wisconsin) *Psychothérapie et relations humaines: Théorie et pratique de la thérapie nondirective*. [Psychotherapy and human relations: Theory and practice of nondirective therapy.] Louvain, Belgium: Publications Universitaires, 1962. 320 p. Belg. Fr. 240.—This, the 1st of 2 volumes, is itself divided into 2 parts. Part I, by Kinget, introduces Rogerian therapy as a viewpoint about human relations. Part II, "Theory and Research" by Rogers, begins with

an account of the development of his therapeutic conceptions and of the early research relative to them. 1 chapter is devoted to a summary of research completed and in progress. To the extent that the necessary and sufficient conditions for therapy are discovered by research, controversy about dogma will decline. (121-item bibliogr.)—*S. S. Marzolf.*

1445. Schneider, Erwin H. (Ed.) Music therapy 1960. Vol. 10. Lawrence, Kans.: Allen, 1961. xiv, 234 p. \$5.20.—This 10th book of proceedings of the National Association for Music Therapy, Inc., covers the following areas of music therapy: current viewpoints, the education and functions of the music therapist, psychiatric hospitals, individual therapy, exceptional children, research, and association growth. The appendix provides valuable references, since it contains the cumulative index from the issues of 1956-59 inclusive, the tables of contents for all issues from 1951-59 inclusive, and membership rules, the revised constitution, and bylaws. There is a listing of all officers, their affiliation and address, and all committees, and their members. (29-item bibliogr.)—*L. A. Ostlund.*

1446. Ungersma, A. J. (San Francisco Theological Seminary) The search for meaning. Philadelphia, Pa.: Westminster, 1961. 188 p. \$4.75.—The author, clinical psychologist and professor in a theological school, worked 1 year with Viktor E. Frankl. This compact book is the result of the influence of Frankl's concepts of existential analysis or logotherapy. According to this view, man is considered a free, responsible agent who chooses his future. The emphasis in logotherapy is the individual's search for "meaning" in his life. This implies a system of higher values. This search is a deep, satisfying experience with spiritual qualities. In this book the principles of logotherapy are integrated with the goals in pastoral counseling and psychotherapy. While Christian and Judaic philosophies are woven with present-day concepts of psychotherapy as represented by the various schools, the author especially culls philosophy, theory, and techniques that parallel and support logotherapy.—*C. A. Curran.*

1447. Van Den Berg, J. H. (U. Leiden, Holland) An existential explanation of the guided daydream in psychotherapy. *Rev. exist. Psychol. Psychiat.*, 1962, 2(1), 5-35.—A method of psychotherapy, originated by Robert Desoille and termed *rêve éveillé dirigé* (guided daydream), is described as to historical development and current techniques, and then illustrated with excerpts from 2 of the author's cases. It presupposes an existential theory of neuroses which bears interesting relationships to conventional approaches such as psychoanalysis. Indications and contra-indications for its use are offered, based upon the author's successful use of the method over a period of 15 years.—*J. Lyons.*

HYPNOSIS

1448. As, A., O'Hara, J. W., & Munger, M. P. The measurement of subjective experiences presumably related to hypnotic susceptibility. *Scand. J. Psychol.*, 1962, 3(1), 47-64.—An instrument to register a variety of subjective experiences presumably related to hypnotizability was constructed on the basis of certain theoretical notions of hypnosis. A comparison of the responses of 471 college students

with the findings of another investigator shows a high degree of response consistency. Some sex differences are discussed. A cluster analysis and a factor analysis of a representative selection of Experience Inventory items and item groups indicate that existing theoretical notions of hypnosis have much in common and may be reduced to a set of very few variables.—*Journal abstract.*

1449. Clernes, Stanley Ronald. (Stanford U.) Repression and hypnotic amnesia. *Dissert. Abstr.*, 1961, 21(11), 3522.—*Abstract.*

1450. Halpern, Seymour. (Central Islip State Hosp., N. Y.) Hypno introspection: A contribution to the theory and practice of hypotherapy: I. Method. *J. Psychol.*, 1962, 53(2), 383-385.—Hypno-introspection is a nonmanipulative approach to hypnotherapy which has been successful in eliminating much of the resistance ordinarily encountered during hypnotic induction. Resistance is obviated by minimizing the patient's fears concerning loss of control. As therapy progresses, the induction of a variety of hypnotic alterations of ego functioning becomes possible. The result has been an extension of the applicability of hypnosis to a wider range of clinical problems.—*Author abstract.*

1451. Halpern, Seymour, & White, Leonard. (Central Islip, N. Y.) Experimental hypnotherapy with a cancer patient. *J. Amer. Soc. Psychosom. Dent. Med.*, 1962, 9(1), 7.—Case report.—J. H. Manhold, Jr.

1452. Heilizer, F. (VA Hosp., Brockton, Mass.) Relations between anxiety and hypnotizability. *Amer. J. clin. Hypn.*, 1961, 4(1), 30-35.—The anxiety concept and the effects of personal anxiety and situational anxiety upon hypnotizability are discussed. It is concluded that no final conclusions are warranted but that there are several interesting possibilities.—M. V. Kline.

1453. Langen, D. Hypnose: Archaische Ekstase und Versenkung. [Hypnosis: Archaic ecstasy and trance.] *Confin. psychiat. Basel.*, 1961, 4(3-4), 228-243.—"The westerner, so often concerned with an analytic approach to the psychic, too easily overlooks the significance of prolonged meditative practice. In the various Asiatic techniques of mediation there are valuable suggestions." Comparisons are drawn between Schultz's "autogenous training" and such techniques.—E. W. Eng.

1454. Levitt, Eugene E., & Lubin, Bernard. (Indiana U.) The effect of incentives on volunteering for an hypnosis experiment. *Int. J. clin. exp. Hypn.*, 1962, 10(1), 39-41.—The data indicated that neither education about hypnosis nor payment for participating in an experiment are likely to bias a student volunteer group for an hypnotic experiment.—C. S. Moss.

1455. London, Perry; Cooper, Leslie M., & Johnson, Harold J. (U. Illinois) Subject characteristics in hypnosis research. *Int. J. clin. exp. Hypn.*, 1962, 10(1), 13-21.—Items of experiences, interests, and attitudes, in London's Survey, tended to cluster among themselves, suggesting a separate factor for each. The items were compared to several objective tests, but correlations were low. The Survey and Shor's Personal Experiences Questionnaire combined, correlated .64 with Stanford Scale A, suggesting the possible development of a paper-and-

pencil predictor of hypnotic suggestability.—C. S. Moss.

1456. McCord, H., & Sherrill, C. I. (U. Colorado, Denver Extension Center) A note on increased ability to do calculus posthypnotically. *Amer. J. clin. Hypn.*, 1961, 4, 124.—In light of the results of this brief investigation, further research points toward determining possible ways hypnosis might be used to upgrade human intellectual functioning.—M. V. Kline.

1457. Meares, A. (45 Spring St., Melbourne, Australia) An evaluation of the dangers of medical hypnosis. *Amer. J. clin. Hypn.*, 1961, 4, 90-97.—The induction of hypnosis by an unskilled person can represent a real danger to the S, but the dangers to the patient in the hands of an adequately trained physician are very small indeed. Because the dangers are definite and clearly formulated, adequate training in this respect should not be unduly difficult.—M. V. Kline.

1458. Montserrat-Estève, S. L'hypnose pendant les cinq dernières années. [Hypnosis during the last five years: 1955-60.] *Acta psychother. psychosom.*, Basel, 1961, 9(6), 429-462.—The last 5 years have seen considerable strides in hypnosis, especially on the American continent, into various areas such as research and therapy. (500-item bibliogr.)—G. Rubin-Rabson.

1459. Orne, Martin T. (Harvard U.) Hypnotically induced hallucinations. In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 211-219.—A brief discussion of the nature of hypnosis. The alternative ways a hypnotized S will respond to a suggestion to hallucinate, in comparison to a faking S are described.—J. B. Thompson.

1460. Orne, Martin T. (Massachusetts Mental Health Center, Boston) Implications for psychotherapy derived from current research on the nature of hypnosis. *Amer. J. Psychiat.*, 1962, 118, 1097-1103.—Some hypotheses derived from research in hypnosis are discussed as they apply to psychotherapy. A program that may be submitted to experimental attack is suggested.—N. H. Pronko.

1461. Rudlová, B., & Rudlová, L. (Neurologická Klinika, Prague) Hypnoza v neurologii. [Hypnosis in neurology.] *Ceskoslov. Psychol.*, 1961, 5, 251-254.—Experience with using hypnosis in neurology is described in differential diagnosis, in supplementing anamnesis, in the therapy of sensory and motor difficulties, in protracted sleep, or in the treatment of sleeplessness. (Russian & English summaries)—V. Břicháček.

1462. Schneck, Jerome M. (New York Downstate Medical Cent.) Hypnoanalysis. *Int. J. clin. exp. Hypn.*, 1962, 10(1), 1-12.—A frankly personal resume of hypnoanalysis by a highly experienced psychiatrist, constituting a brief survey of his many publications.—C. S. Moss.

1463. Shaw, S. Irwin. (Detroit, Mich.) A competent approach to the treatment of gagging, tic douloureux, and bruxism with the use of hypnosis. *J. Amer. Soc. Psychosom. Dent. Med.*, 1962, 9(1), 13.—The use of hypnosis and nondirective counseling technique for treatment.—J. H. Manhold, Jr.

1464. Shor, Ronald E. (Harvard U.) Three dimensions of hypnotic depth. *Int. J. clin. exp.*

Hypn., 1962, 10(1), 23-38.—The writer extends his earlier presentation of a dual-factor theory of hypnosis to include archaic involvement. Although interactions occur among these factors, the depth of each may vary independently. The theory is properly seen as a synthesis and elaboration of many prior theories of hypnosis.—C. S. Moss.

1465. Svorad, D., & Hoskovec, J. (Czechoslovak Acad. Sciences, Prague, Czechoslovakia) **Experimental and clinical study of hypnosis in the Soviet Union and the European Socialist countries: Bibliography.** *Amer. J. clin. Hypn.*, 1961, 4(1), 36-46.—Contains papers on human and animal hypnosis published over an approximate period of the last 40 years. Most of the references consist of papers published during the last 10 years.—M. V. Kline.

1466. Verson, R. D. (Apt. 6676, Caracas, Venezuela) **Technique to control hallucinatory obsessive ideas.** *Amer. J. clin. Hypn.*, 1961, 4, 115-116.—In this clinical case, the S's realization of his control of hallucination and the authority of the child's father were utilized. The child was allowed to direct and to manipulate purposively and pleasurably the father's protective strength and authority.—M. V. Kline.

1467. Weitzenhoffer, A. M. (Stanford U.) **Some speculations regarding the nature and character of hypnotic behavior.** *Amer. J. clin. Hypn.*, 1961, 4, 69-89.—Hypnotic behavior is to be distinguished from other trance behavior in terms of being controlled from within the individual. Hypnotic behavior appears to be multidimensional, having at least a dimension of participation and a dimension of involvement, and probably one of commitment.—M. V. Kline.

DREAMS

1468. Hawkins, David R., Puryear, Herbert B., Wallace, Charles D., Deal, William B., & Thomas, Edwin S. **Basal skin resistance during sleep and "dreaming."** *Science*, 1962, 135(3513), 321-322.—Basal skin resistance was measured continuously in sleeping human Ss. Instead of a hypothesized fall in basal skin resistance during periods of "dreaming" or emergent State 1 electroencephalographic activity, there was a rise which generally coincided with the "dreaming" period. This finding, along with other recent studies, indicates that this state of sleep is not just a light stage of sleep but is unique neurophysiologically.—*Journal abstract.*

1469. Howarth, E. (U. Alberta) **Extroversion and dream symbolism: An empirical study.** *Psychol. Rep.*, 1962, 10(1), 211-214.—"Assessment of dream samples by rating failed to reveal an association between either extroversion or neuroticism and symbolic content of the dreams. Thus there is no evidence in this study for the view that extroverts have extrovert dreams, nor did extroverts reveal less (or more) symbolic dream content. Several relationships were found between personality dimensions and answers to a dream questionnaire."—B. J. House.

1470. Pegge, C. Denis. (Oxford U., England) **The mode of the dream.** *J. ment. Sci.*, 1962, 108, 26-36.—Analysis of dreams without regard to content, as illustrated by 3 dreams of the author's, suggests that items of dream consciousness consist either of imageless awareness or of the experiencing of imagery, or both of these components simultaneously.

As imagery of these dreams is primarily visual, the simulation of visual dreams might be accomplished by a film medium.—W. L. Wilkins.

1471. Ullman, Montague. **Dreaming, life style, and physiology: A comment on Adler's view of the dream.** *J. indiv. Psychol.*, 1962, 18(1), 18-25.—Briefly presents a theory of dream consciousness which integrates some recent physiological findings and explores some Adlerian notions within that context.—A. R. Howard.

1472. Whitman, Roy M., Pierce, Chester M., Maas, James W., & Baldridge, Bill J. (U. Cincinnati Coll. Medicine) **The dreams of the experimental subject.** *J. nerv. ment. Dis.*, 1962, 134(5), 431-439.—"Examination of the dreams of ten experimental volunteer subjects revealed a great deal of anxiety related to the experimenter, the experimental room and equipment, their own behavior and the conditions of their volunteering. Of 111 dreams dreamt over 40 nights, approximately one-third dealt with the experiment obviously, one-third dealt with in a disguised way, and one-third related to other material. In this situation, where one or two male experimenters monitored EEG and eye-movement tracings in a room adjacent to the sleeping subjects, male volunteers dreamt largely of castration anxiety, and female volunteers dreamt largely of sexual exploitation. There was a striking contrast between their overt cooperativeness and the amount of anxiety manifested in the dreams."—N. H. Pronko.

CASE HISTORIES

1473. Barker, J. C. (Harrison Hosp., Dorchester, England) **The syndrome of hospital addiction (Munchausen syndrome).** *J. ment. Sci.*, 1962, 108 (453), 167-182.—7 cases are reviewed in detail to illustrate motivations and possible administrative management, including longterm psychiatric hospitalization. One case had, between 1935 and 1958, 128 hospital admissions and outpatient attendances, 13 abdominal operations, a chiasmal exploration, a standard prefrontal leucotomy, and was certified as psychiatrically ill 6 times. (28 ref.)—W. L. Wilkins.

1474. Bobon, J. **De l'angoisse au jeu verbal: Un cas de glossomanie post-traumatique.** [From anxiety to verbal play: A case of glossomania following a trauma.] *Acta neurol. psychiat. Belg.*, 1961, 61, 793-816.—The Walloon language (native to the town of Liège) has influenced the pseudolanguage (with a general French pattern) of a 41-year-old patient who became confused after a fight in which he sustained a double leg fracture. The dialect from childhood temporarily stirred up and released from the sick mind transforms the verbal expression. At the peak of the psychic disorder the patient uses an old process common in the normal evolution of a living language: the proper derivation, by suffixation. From a psychopathological point of view this pseudo-language with a playful aspect seems to be, on the verbal ground, a childish form of compensation to anxiety as in megalomaniac delusions.—V. Sanua.

1475. Bookbinder, L. J. (VA Hosp., Ann Arbor, Mich.) **Simple conditioning versus the dynamic approach to symptoms and symptom substitution: A reply to Yates.** *Psychol. Rep.*, 1962, 10(1), 71-77.—The controversy over symptom substitution is attributed to lack of agreement about the definition of

symptom. 2 case histories are reported as illustrations of symptom substitution. "It is suggested that the polemic as to whether symptom substitution is a valid phenomenon or not be replaced by attempting to determine: (a) whether a particular patient's anxiety can be reduced by only one or by a repertoire of anxiety-reducing responses; (b) whether any of the responses in the repertoire are socio-medically grave." Suggestions are given for relevant research variables.—*B. J. House.*

1476. Citterio, C., & Rovere, M. D. Contributo allo studio della sindrome di Ganster in soggetti che hanno presentato—distanziati nel tempo—due distinti episodi gansteriani. [Contribution to the study of Ganster's syndrome in subjects that have presented two distinct gansterian episodes over a period of time.] *Arch. Psicol. Neurol. Psichiat.*, 1962, 23(1), 19-43.—2 gansterian episodes are differentiated according to onset, duration, and symptomatology.—*L. L'Abate.*

1477. Elles, G. The mute sad-eyed child: Colateral analysis in a disturbed family. *Int. J. Psycho-Anal.*, 1962, 43(1), 40-49.—The symptoms of the main patient, a 3-year-old child who would not speak, reflected the family constellation where each member reinforced the illness of the others to maintain the maladjustive family structure. Treatment of the boy required treatment of the entire family.—*G. Elias.*

1478. Shapiro, M. B. (U. London, England) The single case in fundamental clinical psychological research. *Brit. J. med. Psychol.*, 1961, 34, 255-262.—Laws discovered using one S will be confirmed with other Ss. Clinical psychological research should center on laws about individuals, not groups. Several illustrations are discussed.—*C. L. Windler.*

1479. Weinberg-Dagoni, E. (Central Hosp., Afula) Hoser teavon shemeatsbanut etsel banot begil habitbagrut. [Anorexia nervosa in adolescent girls.] *Dap. refuim*, 1961, 20, 437-441.—3 cases of 12-14 year old girls suffering from nervous anorexia are described. 2 of them recovered after psychological treatment outside their homes; the 3rd was psychologically treated without satisfactory results. Their refusal to eat reflects their negative relation to the outer world and their displayed insistence on "privilege of existence." The common factors of their anorexia were: too early separation from parents, their position within the family, lack of preparation for life, too early intellectual education. (English & French summaries)—*H. Ormian.*

1480. Ze'ev, Hava. Yehudit: Yomana shel em. [Judith: A mother's diary] Tel Aviv, Israel: Hadar, 1961. 96 p.—A diary written over 3 years (1951-54) by the mother of a polio-afflicted 4-7-year-old girl. The history of the illness (a relatively simple case) is given from its beginning until the girl's recovery. The girl's behavior, especially her reaction to the illness and to her parents' behavior, is discussed.—*H. Ormian.*

PSYCHIATRIC SERVICES

1481. Barton, Walter E. (Boston State Hosp., Mass.) Administration in psychiatry. Springfield, Ill.: Charles C Thomas, 1962. xvi, 773 p. \$24.50.—A text designed primarily to furnish the psychiatrist entering or already engaged in the administrative role of his profession with a fundamental orientation to

the administrative aspects of clinical practice and mental hospital management. Through appended materials, rather specific information is provided on such matters as emergency civil defense and disaster plans used in a state hospital program, personnel procedures, etc. This text provides both a broad and an intensive approach to the day-by-day operational problems faced by the professional psychiatrist serving as an administrator of a mental hospital. Particular attention is paid to such major matters as use of staff, rehabilitation and after-care of the hospitalized, mental patient, treatment of the aged mental patient, care and maintenance of medical records, the use of volunteers, and the organization and administration necessary to manage such an institution.—*M. A. Seidenfeld.*

1482. Eisenberg, Leon. (Johns Hopkins U.) The strategic deployment of the child psychiatrist in preventive psychiatry. *J. child Psychol. Psychiat.*, 1961, 2(4), 229-241.—A review of epidemiologic and experimental evidence leads to the conclusions that (a) long term therapy is no more effective than brief therapy, (b) psychiatric guidance enhances the effectiveness of other mental health personnel, and (c) the introduction of almost any treatment program in institutions helps to control the behavior of delinquents and psychotics. Psychiatrists should, accordingly, devote less time to long term therapy and invest more in research, community mobilization for social welfare programs, early identification of disorders, and consultation. (85 ref.)—*J. M. Reisman.*

1483. Fleminger, J. J., & Mallett, B. L. (Guy's Hosp., London, England) Psychiatric referrals from medical and surgical wards. *J. ment. Sci.*, 1962, 108(453), 183-190.—All new referrals for a 5-year period were studied with salient findings: (a) 0.7% of 50,000 admissions were referred to psychiatrists, (b) 80% were referred by physicians and 20% by surgeons and gynecologists, (c) 40% of the patients seen had no known organic disease, (d) 1/4 were referred for bodily complaints and almost a 1/4 for overt mental disorder, (e) transfer to a psychiatric bed was necessary for 23% and admission to mental hospital for 1%.—*W. L. Wilkins.*

1484. Freour, P., Coudray, P., Serisé, M., & Evans, J. Le psychiatrie et les médecins. [Psychiatry and the doctors.] *Hyg. ment.*, 1961, 50(5), 346-361.—A study of the attitudes towards psychiatry of 100 French physicians revealed that: (a) the physician tends to classify mental illnesses as major or minor, and he treats the latter himself, usually with tranquilizers; (b) he tends to regard psychiatric hospitals in terms of the old asylums, and knows little of modern orientations; (c) most physicians regard mental health as a minor problem and know next to nothing of prophylaxis; (d) there are many prejudices and misunderstandings in the relations between general practitioners and psychiatrists; (e) more information is urgently needed, especially since the general practitioner has become an indispensable collaborator in the struggle for mental health.—*W. W. Meissner.*

1485. Hes, Yosef. (Talbie Hosp., Jerusalem) Beayot hapsikhiatria hasotsyalit. [Problems of social psychiatry.] *Dap. refuim*, 1962, 21, 196-202.—The background of the development of social psychiatry from the beginning of this century in Germany and the present situation is critically described.

Nowadays, social psychiatry studies the epidemiology of mental illness, the interaction of social forces with human adjustment as well as the sociological aspects of psychiatric treatment (e.g., the mental hospital as a small community or the therapeutic milieu). Prevention of mental illness is today considered as a part of social psychiatry. (English & French summaries) —H. Ormian.

1486. Lambo, T. Adeoye. (Aro Hosp. Nervous Diseases, Abeokuta, Nigeria) **A form of social psychiatry in Africa.** *World ment. Hlth.*, 1961, 13(4), 190-203.—Experience at Aro demonstrates that "it is the culture which determines the acceptability, success, or failure of a particular therapeutic orientation. It is also the culture (including social experiences and situation) which either permits or hinders the readiness of the relatives to adjust to the sick person and his emotional needs." Experience also shows that even "in non-literate societies, with their own pre-literate casual formulations, the greater the confidence of the community in the nature and form of treatment they can obtain and in the people who will treat them, the more . . . is their willingness to come forward for treatment."—J. C. Franklin.

1487. Storrow, Hugh A. (U. Kentucky) **Psychiatric treatment and the lower-class neurotic patient.** *Arch. gen. Psychiat.*, 1962, 6(6), 469-473.—Recent suggestions for improved psychiatric care of lower-class patients by increasing somatherapies and number of nonmedical psychotherapists are rejected until further research is done concerning the reasons for the small number of lower-class patients. Various studies indicate that lower-class neurotics seek, accept, and participate in psychiatric treatment more rarely than those from the middle-class. Past mental health education showed little change. (16 ref.)—L. W. Brandt.

1488. Vail, D. J. (Minnesota Dept. Public Welfare, St. Paul) **Mental hospital careers: A student's-eye view.** *Ment. Hosp.*, 1962, 13(3), 166-167.—Results of a questionnaire answered by advanced medical students who had spent the summer as clinical clerks in Minnesota state mental hospitals are cited.—L. Gurel.

Institutional Care

1489. Bates, Frederick, & White, Rodney. (Louisiana State U.) **Differential perceptions of authority in hospitals.** *J. Hlth. hum. Behav.*, 1961, 2(4), 262-267.—In order to study the perception of authority, a self-administered questionnaire was given to 282 respondents including members of boards of trustees, hospital administrators, and nurses. Statistically significant differences were obtained in the amount of authority which the groups reserved for themselves.—L. A. Ostlund.

1490. Burdock, E. I., & Hardesty, Anne S. (New York State Dept. Mental Hygiene) **An outcome index for mental hospital patients.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 666-670.—"An Outcome Index for mental hospital patients is described. The index relates time out of hospital to follow-up period since first admission and weights their ratio differentially by number of readmission and releases. This index becomes relatively stable on a 2-year follow-up. It can be used as a criterion for prognostic efficiency, for efficacy of treatment, and for characterizing institutional policy."—G. Frank.

1491. Deane, William N. **The reactions of a nonpatient to a stay on a mental hospital ward.** *Psychiatry*, 1961, 24(1), 61-68.—This staff sociologist at the Vermont State Hospital at Waterbury resided on the rehabilitation ward for 7 days as a volunteer patient. Describing his emotional reactions, he noted their likeness to the symptomatology of several patients and the intensification of existing personality traits. He gained an altered understanding of patient life and routine, particularly of the special nature of leisure time in the hospital.—C. T. Bever.

1492. Dodge, Joan S. (Cornell U.) **Nurses' sense of adequacy and attitudes toward keeping patients informed.** *J. Hlth. hum. Behav.*, 1961, 2(3), 213-216.—A group of 126 nurses were questioned concerning attitudes towards self, patients, and patient care. The nurses were classified according to strong versus weak self-perception. It was concluded that "willingness to keep the patients medically informed is related to certain aspects of the self-picture—in particular, to a feeling of personal inadequacy or psychological strength."—L. A. Ostlund.

1493. Gralnick, Alexander. **Changing relations of the patient, family and practicing psychiatrist to the therapeutic community.** *World ment. Hlth.*, 1961, 13(2), 82-91.—"The changing scene in psychiatric hospitals [is] described with emphasis on the relationship between psychiatrist, patient and family." Altogether, "emphasis must be shifted towards 'total' treatment of the patient in an enlightened social setting. Here, active patient participation will be an index of healthy group interaction between various staff members and patients." Special attention is given to why the psychiatrist should be integrated into hospital activities and to the therapeutic effectiveness of short versus long hospitalization.—J. C. Franklin.

1494. Greenblatt, Milton. (Massachusetts Mental Health Center) **The transitional hospital: A clinical and administrative viewpoint.** *J. soc. Issues*, 1960, 16(2), 62-69.—A discussion of 2 broad goals in social psychiatry: the development of a "therapeutic community" within the mental hospital, involving breaking down barriers between staff and patients and an all-out development of therapeutic potentials; and the development of a "community mental hospital" by "stimulating joint responsibility and collaboration of both hospital and community in many aspects of mental illness and health." (33 ref.)—E. Y. Beeman.

1495. Hiller, E. Wesley, & Nesvig, David. (Mental Health Research Inst., Ft. Steilacoom, Wash.) **Changes in intellectual functions of children in a psychiatric hospital.** *J. consult. Psychol.*, 1961, 25(4), 288-292.—Wechsler and Bender-Gestalt were given 3 times over a 1-2 year period. Significant improvements appeared, particularly on verbal subtests and Bender-Gestalt. IQ scores did not rise; but, ratings of clinical improvement were related to Verbal IQ, Full-Scale IQ, Digit Span, and Gray Oral Reading Test. Most hospitalized children have problems which cause them to be retarded in verbal skills.—E. R. Ogting.

1496. Himes, Joseph S. (North Carolina Coll.) **Social distance to three types of hospitals.** *J. Hlth. hum. Behav.*, 1961, 2(3), 210-213.—The study attempted to differentiate patterns of appropriate re-

sponses towards individuals confined in ordinary, tubercular, and mental hospitals. The data were derived from questionnaires completed by 229 college students. Differences were evident in what was considered to be appropriate responses to the 3 kinds of patients. Communication of concern and personal contacts were considered appropriate for general and tubercular patients, while, there was a tendency to minimize all responses, particularly personal contacts, towards mentally ill patients.—*L. A. Ostlund.*

1497. Kramer, Bernard M. (Tufts U.) **The day hospital: A case study.** *J. soc. Issues*, 1960, 16(2), 14-19.—A description of the day hospital associated with the Massachusetts Mental Health Center, its patient-population, staff, physical setting, routine, and meaning for the patient.—*E. Y. Beeman.*

1498. Mabry, John H. (U. Kentucky Medical Coll.) **Statistical notes on some British "open" mental hospitals.** *Int. J. soc. Psychiat.*, 1961-62, 8(1), 19-31.—This report is based on visits to 6 British open hospitals during the summer of 1958. It was found that the open hospital does not necessarily require a higher budget nor an increase in the patient-staff ratio. The number of patients treated per psychiatrist tends to be higher in open hospitals, partly because of the greater admission. The open hospital seems able to use its resources more efficiently than the traditional type of mental hospital.—*R. M. Frumkin.*

1499. Mitchell, Joyce. (Royal Infirmary, Sunderland, England) **A program for the geriatric patient.** *ASHA*, 1962, 4(6), 167-171.—A speech clinician has been included in the team, at the geriatric unit of the United Oxford Hospitals, Oxford, England. The plan of the geriatric unit is described with the day hospital considered an environment for the older person impaired in speech and language. Management during early phases is described. Some of the ways in which the problems of the "long-stay" patient are faced are described.—*M. F. Palmer.*

1500. Nurse Utilization Project Staff. (State U. Iowa) **An investigation of the relation between nursing activity and patient welfare.** Iowa City, Ia.: State Univer. Iowa, 1960. xxxi, 412 p.—Describes 5 experiments in which nursing care was changed on medical, surgical, and urological wards. Changes included increasing nursing care hours per patient and conducting inservice education programs for nursing service personnel. "The development of instruments for measuring patient welfare and the use of these instruments as the criterion for evaluating changes in nursing care is the unique feature which distinguishes this study from most other nursing research." Work sampling techniques were used to determine the pattern of nursing activity during each experimental period. In general, the experimental variables failed to produce any favorable changes in either the pattern of nursing activity or the level of patient welfare.—*J. R. Simon.*

1501. Ryan, James H. (VA Hosp., Bronx, N. Y.) **The therapeutic value of the closed ward.** *J. nerv. ment. Dis.*, 1962, 134(3), 256-262.—"One hundred hospitalized mental patients were interviewed at time of discharge, to determine, from the patient's point of view, what therapeutic factors are offered by closed and semi-closed wards. Forty-five per cent of the study group indicated that protection from the com-

munity and superimposed control of their lives were the two factors most significant in their recovery. The effect of interpersonal relationships with staff and other patients is discussed briefly. This report suggests that the positive therapeutic effect of isolation and control be studied further before these techniques are discarded in favor of the open hospital."—*N. H. Pronko.*

1502. Schmidt, H. O., Fonda, C. P., & Lester, J. R. (Norwich State Hosp., Conn.) **A seminar approach for liberating the therapeutic potential of nurses and psychiatric aides: An exploratory study.** *Psychol. Rep.*, 1962, 10(1), 33-34.—"The efficacy of small discussion groups in producing a rapid reduction in custodial orientation on the part of nurses and charge aides was demonstrated."—*B. J. House.*

1503. Weihl, Hana. **Bet holim leholey nefesh kemanganon byurokrati.** [A mental hospital as a bureaucratic body.] *Me'gamot*, 1962, 12, 79-83.—Communication channels operating within a mental hospital, especially those regulating contacts between patients and staff members, are analyzed. A therapeutic approach by all these members is necessary, but its possibility depends upon the general structure of the hospital and the smooth running of information through formal and informal communication channels. Conflicts arise between the different aspects of the structure—those involved in its nature as a bureaucratic body and those connected with its aim to treat patients. (English summary)—*H. Ormian.*

1504. Wing, J. K. (Inst. Psychiatry, London) **Institutionalism in mental hospitals.** *Brit. J. soc. clin. Psychol.*, 1962, 1(1), 38-51.—Ratings of mental symptoms, ward behavior, and attitudes to discharge were made on randomly selected halves of all chronic male schizophrenic patients resident 2 or more years in 2 London hospitals. The results suggested that "patients gradually develop an attitude of indifference towards events outside the hospital which is part of a syndrome of 'institutionalism.'"—*C. M. Franks.*

1505. Winick, Charles. (Found. Day Hospitals, N. Y.) **Psychiatric day hospitals: A survey.** *J. soc. Issues*, 1960, 16(2), 8-13.—A discussion of day hospitals, different functions they may serve, selection of patients, staff composition, and treatment offered.—*E. Y. Beeman.*

Community Services

1506. Bailey, N. F., & Davis, E. L. (Jefferson City, Mo.) **Missouri's patient-placement program.** *Ment. Hosp.*, 1962, 13(3), 170-171.—A 1956 pilot program at Fulton State Hospital "led to the passage in 1959 of state legislation authorizing and providing funds for a patient placement program. Less than two years later 939 patients had been placed; of these, only 64—less than 7 per cent—had to return to the mental hospitals."—*L. Gurel.*

1507. Caplan, Gerald. (Harvard U.) **An approach to community mental health.** New York: Gune & Stratton, 1959. ix, 262 p. \$4.50.—Based on a series of lectures to various groups of professional workers, this volume is concerned with the nature of preventive psychiatry and the role of various professional personnel in providing preventive mental health services. The author discusses certain aspects of ego psychology and illustrates, from psy-

chological problems in pregnancy and early mother-child relationships, how problems in adjustment develop. The role of the nurse in maternal and child care, the social worker in the public health setting, and the family doctor are all discussed as they relate to the prevention of emotional disorder. The book concludes with a brief description of the structure of a community psychiatric program.—E. A. Rubinstein.

1508. Halmosh, Avraham. (Mental Health Clinic, Ramat Hen) *Sekirat sikum haaavoda bemirpaa livriut hanefesh*. [Final review of work in a mental health clinic.] *Dap. refuim*, 1962, 21, 58-66.—The Mental Health Clinic in Ramat Hen was established 10 years ago by the Sick Fund. Its structure, staff, and organization of work with children are described. During 1960, 602 children 3-16 years old were examined. The implications of the findings are discussed and further investigations suggested. (English & French summaries)—H. Ormian.

1509. Kantor, D., & Greenblatt, M. (Harvard) *Wellmet: Halfway to community rehabilitation*. *Ment. Hosp.*, 1962, 13(3), 146-152.—"... a unique experimental halfway house for chronic mental patients" was established in Cambridge, Massachusetts, in July 1960 by Harvard University and Radcliffe College students.—L. Gurel.

1510. Kramer, Bernard M. *Day hospital: A study of partial hospitalization in psychiatry*. New York: Grune & Stratton, 1962. xiv, 103 p. \$2.75.—The background of the day care program is reviewed and its application at the Massachusetts Mental Health Center is presented in detail. It is suggested that "75% of acute patients now hospitalized full-time could be handled on a day basis." Most categories of mental illness are included in the estimate. Need for the 24-hour "total institution" is viewed as greatly reduced.—R. Tyson.

1511. Landy, David. (U. Pittsburgh) *Rutland Corner House: Case study of a halfway house*. *J. soc. Issues*, 1960, 16(2), 27-32.—A description of this halfway house—its history, functions, and residents.—E. Y. Beeman.

1512. Lewis, F. A., & Kraft, A. M. (Fort Logan Mental Health Cent.) *Fort Logan: A community-oriented program*. *Ment. Hosp.*, 1962, 13(3), 154-157.—The rationale behind the establishment of Colorado's second state mental hospital is cited.—L. Gurel.

1513. Wechsler, Henry. (Harvard U.) *Halfway houses for former mental patients: A survey*. *J. soc. Issues*, 1960, 16(2), 20-26.—A discussion and description of this method of facilitating the transition from the hospital to the community.—E. Y. Beeman.

Case Work

1514. Briar, Joseph Scott. (Columbia U.) *The effects of client social class, social class distance, and social work experience on the judgments of social work students*. *Dissert. Abstr.*, 1961, 21(12), 3870-3871.—Abstract.

1515. Chance, Erika; Arnold, Jack, & Tyrrell, Sybil. (Mt. Zion Hosp., San Francisco) *Professional background and themes used in clinical case description*. *Hum. Relat.*, 1962, 15(1), 53-61.—Similarities and differences in clinical thinking among 400 Freudian psychiatrists, psychologists, and social

workers were investigated by evaluations of the transcripts of 1 analytic and 1 therapy session. Results indicate: (a) that psychologists differ from psychiatrists and social workers in their approach to transference and countertransference problems, (b) social workers more frequently comment favorably on the therapist and his technique, and (c) social workers tended to more frequent moralistic judgments of the therapy patient's alcoholism and promiscuity.—W. W. Meissner.

1516. Kogan, Leonard, (Ed.) *Social science theory and social work research*. New York: National Association Social Workers, 1960. 140 p. \$2.75.—This volume presents the proceedings of a 4-day interdisciplinary institute held in June 1959 by the Social Work Research Section of the National Association of Social Workers and financed by the National Institute of Mental Health. In addition to a summary of discussions the following prepared papers are included: "The Backdrop for Social Research: Theory-making and Model-building" (M. Loeb), "Role and Reference Group Theory" (E. Borgatta), "The Implications of Role Theory for Casework Research" (B. Werble), "Role and Reference Group Theory: Implications for Social Work Research" (A. Klein), "Organizational Analysis" (A. Gouldner), "Social Science and the Conceptual Framework for Community Organization Research" (A. Kahn), "Organization Theory: Implications for Administration Research" (H. Stein), "Theory and Research on the Small Group: Selected Theses and Problems" (E. Thomas), "Small-group Theory: Implications for Casework Research" (N. Polansky), "Small-group Theory and Research: Implications for Group Work Practice Theory and Research" (R. Vinter), "The Relationships Among Social Work Practice, Social Work Research, and the Social Sciences" (L. Kogan).—Author abstract.

1517. Thomas, E. J. *Experimental analogs of the casework interview*. *Soc. Wk.*, 1962, 7(2), 24-30.—The use of "experimental analogs" as a method of controlled study of client and social worker interaction. Usually, an actress is assigned to play the role of patient, and the reactions of the social worker are analyzed.—G. Elias.

COUNSELING & GUIDANCE

1518. Burton, Genevieve. *Group counseling with alcoholic husbands and their nonalcoholic wives*. *Marriage fam. Liv.*, 1962, 24, 56-61.—The operation and experiences of a group counseling program are reviewed. Counseling was conducted for husbands and wives, both spouses being carried in the same group.—L. Shatin.

1519. McGowan, John F., & Schmidt, Lyle D. (U. Missouri) *Counseling: Readings in theory and practice*. New York: Holt, Rinehart & Winston, 1962. xiv, 623 p. \$7.95.—A collection of 67 recent papers. Part I considers: a definition and description of counseling as a psychological specialty, historical antecedents of counseling psychology, and current problems of counselor education. Part II deals with: counselor and client expectations of the counseling process, counseling techniques, the importance of the counselor-developing his unique "style" and adapting techniques to particular problems, operant conditioning as a counseling technique, problems of time and

opportunity for counseling and their implications for the counselor and the client, verbal and nonverbal communication in the counseling process, test use and interpretation, and evaluating results of counseling. Part III considers: professional responsibility and morale, the counselor's relationship to other professions, counselor ethics, and legal considerations of importance to the professional counselor.—C. H. Miley.

1520. **Morman, Robert R.** (Los Angeles State Coll.) **Automation and counseling.** *Personnel guid. J.*, 1962, 40(7), 594-599.—The impact of automation is already being felt in the fields of educational counseling. Automation will affect every occupational level in this country and is expected itself to become the top industry of the future. Important implications for counseling include: counseling clients in changed economic milieus regarding long-range educational and vocational plans, and advising on present and future job opportunities in the field of automation. Automation will bring opportunities as well as problems. (18-item bibliogr.)—S. Kavruck.

1521. **Mueller, Vernon John.** (Ohio State U.) **The relationship between measures of the appropriateness of counselor subrole behavior and interview outcome.** *Dissert. Abstr.*, 1961, 21(11), 3527.—Abstract.

1522. **Pohlman, Edward Wendell.** (Ohio State U.) **A study involving client preferences for counselor behavior in counseling.** *Dissert. Abstr.*, 1961, 21(10), 3167.—Abstract.

1523. **Reiser, Martin.** (Temple U.) **The effects of group counseling on interpersonal relationships, anxiety level, intellectual functioning, and certain personality characteristics in a planned workshop experience.** *Dissert. Abstr.*, 1961, 22(1), 325.—Abstract.

1524. **Shoben, Edward J., Jr.** (Columbia U.) **The counselor's theory as personal trait.** *Personnel guid. J.*, 1962, 40(7), 617-621.—Theories in counseling are necessary tools to bring orderliness into the chaotic world of the counseling interchange and to promote the counselor's understanding of his client. But theories are destined by their abstract nature to ignore the unique qualities of a particular counselee's behavior and history, and may draw the counselor into conceiving the case before him as a representation of abstract ideas and formal relationships rather than as a highly distinctive and individual human being. The primary contribution of theory to counseling concerns the articulation of a set of ideas by which the counselor can discover order in counseling relationship. By "knowing himself," the counselor is likely to achieve the flexibility vital to professional growth.—S. Kavruck.

1525. **Waldman, Marvin.** (Temple U.) **The effects of group counseling in a controlled workshop setting on attitude, manual dexterity and ability to perceive correct spatial relations.** *Dissert. Abstr.*, 1961, 22(1), 328-329.—Abstract.

MARRIAGE & FAMILY PROBLEMS

1526. **Blood, Robert O., Jr.** (U. Michigan) **Marriage.** New York: Free Press Glencoe, 1962. xix, 515 p. \$6.00.—A revision of the author's 1955 text entitled *Anticipating Your Marriage* (see 29: 901). Considers "the entire cycle of family living

from dating through child-rearing." Extensive readings and references are included.—C. H. Miley.

1527. **Blood, Robert O., Jr., & Wolfe, Donald M.** **Husbands and wives: The dynamics of family living.** New York: Free Press Glencoe, 1960. xxi, 293 p. \$5.00.—A study of 909 families (731 urban and 178 rural) relative to sociological and psychological factors in marriage. Wives, but not husbands, were given a "structured and controlled interview of more than one hour each." Aspects studied include: power and authority, sex roles and division of labor, economic functions, children and family planning, companionship, emotional well-being, love, and strength and stresses. (42 ref.)—D. G. Brown.

1528. **Bodarky, Clifford John.** (U. Puerto Rico) **College students' attitudes towards marriage: A psychological research presentation with cross-cultural implications.** *Pedagogia, Rio Piedras*, 1962, 10, 81-87.—"The problem for this study was twofold: (1) to evaluate the anticipated role behavior in marriage among unmarried students and (2) to analyze the factors which helped develop these attitudes." 50 unmarried students (25 men and 25 women) at the University of Florida were interviewed. None had had a formal course in marriage and the family. 66% of the Ss indicated that the church had not contributed in a helpful sense to the development of their attitudes toward marriage. 70% reported that the school had not contributed either. 94% felt that they wanted sex to be a shared mutual expression of love and need in marriage.—R. E. Morán.

1529. **Ellis, Albert.** (NYC) **The American sexual tragedy.** (2nd ed.) New York: Lyle Stuart, 1962. 320 p. \$5.00.—A study of contemporary American attitudes on sex, love, marriage, and family relations, as expressed in such media as best-selling fiction and nonfiction books, magazines, newspapers, motion pictures, stage productions, radio and television programs, etc. Some of the topics include: the psychology of dress, beauty, romantic love, jealousy, weddings, family conflicts, divorce, and differences in sexual response. (281 ref.)—D. G. Brown.

1530. **Fallding, Harold.** (U. New South Wales, Australia) **The family and the idea of a cardinal role: A sociological study.** *Hum. Relat.*, 1961, 14(4), 329-350.—3 types of family orientation are described: (a) the adaptation type, in which husband and wife seek markedly different satisfactions from life; (b) the identification type, in which both parents identified their personal interests with those of the family itself; and (c) the false-identification type, which is intermediate between the preceding types in that the place of the family in relation to other interests remain undetermined for one or both partners and, on the other hand, the intrusion of critical differences of interest into common consciousness is avoided. The cardinal role in identification-type families has a unifying function insofar as both parents approach global identities which become nearly identical. (17 ref.)—W. W. Meissner.

1531. **Geismar, L. L., LaSorte, Michael A., & Ayres, Beverly.** (Rutgers U.) **Measuring family disorganization.** *Marriage fam. Liv.*, 1962, 24, 51-56.—An instrument for measuring family disorganization was tested on 150 urban families known to be seriously disorganized. The data were submitted to scalar analysis, and the results interpreted relative to

the meaning of the types and degrees of familial disorganization.—*L. Shatin.*

1532. **Greenberg, Herbert M., & Corwin, Jeanne.** (New Brunswick, N. J.) **A theoretical discussion on canalization as it applies to love in our culture.** *J. soc. Psychol.*, 1962, 56, 171-178.—Canalization is the fixing upon a specific satisfier of a general drive. Love has been defined in this paper as canalization, when the love satisfier provides sufficient pleasure over sufficient time. Once canalization or real love has occurred it is permanent, becoming a part of the drive system of the individual. Thus, when a satisfier, one's mate, has been canalized upon, there is an excellent chance for permanence and happiness. However, our society provides many barriers to canalization on a member of the opposite sex. The superficiality and mutual exploitiveness of our courtship and dating patterns and the double sex standard make it difficult to develop a deep enough relationship (from which sufficient pleasure over sufficient time can be achieved) so that canalization can occur. Ways of achieving healthy canalization in our society are explored.—*Author abstract.*

1533. **Halliday, Jean, & Paolucci, Beatrice.** **An exploration of home management goals.** *Marriage fam. Liv.*, 1962, 24, 68-74.—This is the preliminary report of a self-administering inventory designed to measure the short-term and long-term personal goals of home management.—*L. Shatin.*

1534. **Heer, David M.** (U. California, Berkeley) **Husband and wife perceptions of family power structure.** *Marriage fam. Liv.*, 1962, 24, 65-67.—138 oral interviews with Roman Catholic married couples of Irish descent in the Boston Standard Metropolitan Statistical Area revealed that "husbands' perceptions of the family power structure are shown to be significantly different from that of their wives."—*L. Shatin.*

1535. **Heigl-Evers, Annelise, & Heigl, Franz.** **Geben und Nehmen in der Ehe: Eine tiefenpsychologische Studie.** [Give and take in marriage: A depth psychological study.] Stuttgart, Germany: Verlag Angewandte Psychologie, 1961. 87 p. DM 7.50.—Based on the authors' psychotherapeutic practice, and addressed to the intelligent layman, this book discusses, in concrete terms, day-to-day difficulties encountered in married life. What frequently appears as a banal problem typically centers around 1 of 3 major themes: (a) possession, (b) worth, and (c) love (or sexuality in the narrower sense). This treatise deals with marital problems surrounding possession and possessiveness, which the authors consider primary. Subsequent publications will be devoted to the remaining 2 problem areas.—*H. H. Strupp.*

1536. **Kerckhoff, A. C., & Davis, K. E.** (Duke U.) **Value consensus and need complementarity in mate selection.** *Amer. sociol. Rev.*, 1962, 27(3), 295-303.—"For college couples who were seriously considering marriage, measures of need complementarity (Schutz's FIRO scales) and value consensus (Farber's index of consensus) were compared with progress toward permanence over a seven month period. Consensus was found to be significantly related to progress for only the short-term couples, and complementarity was significant for only the long-term couples. These findings are interpreted as indicating that a series of filtering factors operate in

mate selection with social status variables (class, religion, etc.) operating early in the relationship, consensus on values somewhat later, and need complementarity still later. The delay in the effectiveness of the complementarity factor is seen as due to stylized boy-girl interaction and unrealistic idealization of the loved one in the early stages of the relationship."—*L. Berkowitz.*

1537. **Kotlar, Sally L.** (Beverly Hills, Calif.) **Instrumental and expressive marital roles.** *Sociol. soc. Res.*, 1962, 46(2), 186-194.—This is a study of 100 middle-class married couples. The purpose of this particular phase of the study was twofold: (a) to determine whether marital roles for the husband and for the wife are differentiated with respect to instrumental and expressive components and (b) to ascertain whether differences in these role components in terms of self-perception, mate perception, and ideal marital role concepts were related to marital adjustment category.—*C. W. Page.*

1538. **Lomas, P.** **Family role and identity formation.** *Int. J. Psycho-Anal.*, 1961, 42(4-5), 371-380.—Describes a mental patient's case history to show how her prepsychotic illness resulted from failures in her family organization. While the early physical handling of the patient and the vicissitudes of her instinctual drives were admittedly important in her development, the final result of these factors on the patient's personality was related to the entire family constellation in which the patient was reared.—*G. Elias.*

1539. **Serrano, Alberto C., McDonald, Eugene C., Goolishian, Harold A., MacGregor, Robert, & Ritchie, Agnes M.** (U. Texas Medical Branch, Galveston) **Adolescent maladjustment and family dynamics.** *Amer. J. Psychiat.*, 1962, 118(10), 897-901.—63 adolescents and their families were studied for the underlying dynamics. The patients were found to fall into 4 diagnostic categories and the families into 4 types of family interaction, each related to 1 of the 4 types of adolescent disturbance.—*N. H. Pronko.*

1540. **Stuart, Irving R.** (Hunter Coll.) **Complementary vs. homogeneous needs in mate selection: A television program situation.** *J. soc. Psychol.*, 1962, 56, 291-300.—70 women and 43 men were interviewed and tested as voluntary applicants for a television program whose purpose was to introduce individuals to each other with the possibility that it would lead to marriage. A board of psychologists was established to interview, test, evaluate, and categorize all applicants as to personality structure and interests. This material was then used to establish suitable groupings of a member of one sex with 3 members of the opposite sex. The problem of establishing a suitable criterion for the matching of personality needs was approached via the Maslow Security-Insecurity Inventory, the Rotter Incomplete Sentences Blank, and the Machover Figure Drawing Test. The results of these tests were not very meaningful since the applicants gave only expected replies in the non-clinical environment. The projective test was the most useful, but still limited because of the circumstances under which it was administered. A questionnaire indicated that what most of the applicants sought for in a mate were personality qualities which complemented their own, and that they evaluated their own desirability not in terms of qualities usually as-

sociated with being a good husband or wife, but in terms of social graces and physical attractiveness.—*Author abstract.*

1541. Toman, Walter. (Brandeis U.) **Family constellation; Theory and practice of a psychological game.** New York: Springer, 1961. viii, 248 p.—Observations based on family constellations of over 400 persons "have been integrated into a system comprising eight basic types of sibling position and sixty-four basic types of conflict possible between a person and his or her parents." After a description of the "game" and methodological considerations, the 8 major types are presented in the form of character portraits, followed by 6 case examples and theoretical discussion. (58 ref.)—*H. P. David.*

MENTAL HEALTH & REHABILITATION

1542. Alberts, Dorothy; Hudec, Martha; Lever, P. Gordon, & West, Fred R. (South Florida State Hosp.) **Farm project proves successful for Florida mental patients.** *J. Rehabil.*, 1962, 28(2), 15.—A brief presentation of a rehabilitation project for the employment of Negro mental patients undergoing rehabilitation at South Florida State Hospital.—*M. A. Seidenfeld.*

1543. Alonso, A. Mateo. (Caracas, Venezuela) **Who is mentally healthy?** *World ment. Hlth.*, 1961, 13(1), 21-25.—The necessary components of mental health as discussed resolve into this definition of mental health: "A personal condition liable to variations through the influence of biological, psychological, and social factors; that maintains intrapersonal harmony; that enables the establishment of good relations with fellow creatures and the ability to face life gracefully; that befriends the individual as an active partner in the constructive work of the psychological and social milieu where he evolves; and finally endows the person with abundant energy to employ it in valuable outside activities."—*J. C. Franklin.*

1544. Arnholter, E. G. (Indianapolis Goodwill Industries) **The validity of Fisher's maladjustment and rigidity scales as an indicator of rehabilitation.** *Personnel guid.*, 1962, 40(7), 634-637.—Neither Fisher's Rorschach Rigidity or Maladjustment scales predicted ultimate employability. Staff ratings based on several variables are likely to be more valid.—*S. Kavruck.*

1545. Berner, Bernard. (New York U.) **Description and evaluation of a Veterans Administration tuberculosis hospital rehabilitation program.** *Dissert. Abstr.*, 1961, 21(10), 3179-3180.—*Abstract.*

1546. Black, Bertram J., Meyer, Henry J., & Borgatta, Edgar F. (Altro Health & Rehabilitation Services, N. Y.) **Altro Health and Rehabilitation Services: Case study of a protected workshop.** *J. soc. Issues*, 1960, 16(2), 40-46.—A description of the Altro program, the population served, the staff, and the services offered. When a sample of ex-psychiatric patients served by Altro was compared with a sample not served; the difference in rehospitalization rate was in the direction expected but not statistically significant.—*E. Y. Beeman.*

1547. Bugallo, Oscar. **Aportaciones al diagnóstico y tratamiento de las neurosis y psicosis infanto-juveniles.** [Contributions to the diagnosis and treatment of infantile and juvenile neuroses and

psychoses.] *Acta neuropsychiat. Argent.*, 1961, 7(3), 195-197.—Survey of progress in dealing with mental illness in children and juveniles in Argentina. Some suggestions are made for better organization of efforts to deal effectively with the problems involved.—*W. W. Meissner.*

1548. Crawford, Fred R., Rollins, Glen W., & Sutherland, Robert L. (Texas State Dept. Health) **Variations in the evaluation of the mentally ill: II. The viewpoint of the rural dweller.** *J. Hlth. hum. Behav.*, 1961, 2(4), 267-275.—The goal was to determine how a group of rural dwellers differ from urban dwellers in their attitudes toward mental illness. The Ss were 230 rural and 718 urban respondents in 4 Texas counties. The results indicated that rural and urban dwellers utilize mass communication media and evaluate illness categories in similar ways. Moreover, it was believed that those who disseminate mental health information had changed and improved the knowledge of Texas residents. However, changes in actions toward mental illness by the residents had not been demonstrated.—*L. A. Ostlund.*

1549. Dinitz, Simon; Angrist, Shirley; Lefton, Mark, & Pasamanick, Benjamin. **Instrumental role expectations and posthospital performance of female mental patients.** *Soc. Forces*, 1962, 40(3), 248-254.—6 months after discharge, over 200 former patients and a "significant other" (a person significant to a former patient) of each were interviewed. A positive relationship is revealed between the expectations of these others and the posthospital performance of certain domestic and social activities by the discharges. "The greater the expectations of significant others and of the patients themselves, the higher the level of posthospital patient functioning [and] the greater the agreement in expectations between patient and significant other, the greater the tendency for better posthospital performance."—*A. R. Howard.*

1550. Dohrenwend, Bruce P. (Columbia U.) **Some aspects of the appraisal of abnormal behavior by leaders in an urban area.** *Amer. Psychologist*, 1962, 17, 190-198.—Questionnaire interviews were conducted with 87 leaders in a "Health District in New York City." Brief case descriptions of 6 kinds of pathological behavior were read individually to each leader. Educational and religious leaders are much more likely to see the cases as mentally ill, while the economic leaders manifest relatively low tendencies in this regard. Educational and religious leaders "estimate that they are asked for advice about problems of mental disorder more frequently than the political-legal and economic leaders." There are "high tendencies of the educational leaders and low tendencies of the economic leaders to regard the disorders as serious."—*S. J. Lachman.*

1551. Goertzel, Victor; Beard, John H., & Pinnick, Saul. (Fountain House, NYC) **Fountain House Foundation: Case study of an expatients club.** *J. soc. Issues*, 1960, 16(2), 54-61.—A description of Fountain House, a club for former mental patients—its history, theoretical orientation, membership, staff, and types of services offered.—*E. Y. Beeman.*

1552. Havens, Leston L., & Harding, Francis A. (Massachusetts Rehabilitation Commission, Boston) **Rehabilitating the mentally disabled: A report of the Massachusetts Commission's methods and ex-**

perience. *J. Rehabil.*, 1961, 27(6), 22-23, 43-46.—The Massachusetts Rehabilitation Commission has developed a method of dealing with the problems of mental health and illness by establishing a Mental Health Section consisting of a chief of mental health and 5 senior counselors. This approach appears to succeed in supplying the rehabilitation counselor with some expert help in dealing with the complicated problems of their clients who are disabled by mental illness. The complexity of the mentally ill appears to require considerable additional training for the counselor which, in the Massachusetts program, is supplied through tutorial assistance. The methods for accomplishing this are described, and emphasis is placed upon the fact that the same time factors which may be applied in coping with the vocational rehabilitation of the physically disabled do not apply to the problems of these clients—they take longer, more intensive efforts and the client must often have continuing treatment to maintain his gains.—*M. A. Seidenfeld.*

1553. Landy, David. (U. Pittsburgh) **Rehabilitation as a sociocultural process.** *J. soc. Issues*, 1960, 16(2), 3-7.—A discussion of psychiatric rehabilitation in terms of processes of socialization and cultural conformity.—*E. Y. Beeman.*

1554. Landy, David, & Wechsler, Henry. (U. Pittsburgh) **Common assumptions, dimensions, and problems of pathway organizations.** *J. soc. Issues*, 1960, 16(2), 70-78.—A discussion of the common elements among the different approaches toward rehabilitation of the former mental patient back into the community environment. There is a need for more research in this field, but the problems involved are many and difficult.—*E. Y. Beeman.*

1555. Lichtenberg, P., Cassetta, Rhonda K., & Scanlon, J. C. (Bryn Mawr Coll.) **Mutual achievement strivings: A continuum for mental health.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 619-628.—Mental health is defined in transactional terms, i.e., in terms of the intent of an individual towards equality or mutuality of achievement in relating to others. 4 levels of mutual achievement striving are described and a continuum composed of 8 varieties of intention-transactions is offered. Case histories of 64 patients admitted to a psychiatric hospital were examined to isolate events which could be evaluated in terms of the intention-transaction dimension. Each S was assigned a score on this continuum which reflected his degree of "mental health," and these scores were then compared to a measure of severity of mental illness (see 35: 6569), psychiatric diagnosis, type of treatment recommended, and outcome of treatment. Intention-transaction scores correlated positively with the variables.—*G. Frank.*

1556. Moes, J. Howard. (Jewish Vocational Service, Los Angeles, Calif.) **V. R. Workshop attacks psychological barriers.** *J. Rehabil.*, 1962, 28(2), 10-12.—Based upon his experience as a workshop director of handicraft industries, the author indicates the value of a combination of individual and group counseling with the wide variety of work experiences available in a rehabilitation workshop. This situation affords the client the opportunity to verbalize his feelings about the natural events associated with work, such as competition, conflict, job pressures, and pay.—*M. A. Seidenfeld.*

1557. Mortensen, Benjamin Franklin. (U. Utah) **The relationship of certain biographical information to the successful vocational rehabilitation of psychiatric patients.** *Dissert. Abstr.*, 1961, 21(11), 3526.—*Abstract.*

1558. Olshansky, Simon. (Cambridge Service Retarded Children) **The transitional sheltered workshop: A survey.** *J. soc. Issues*, 1960, 16(2), 33-39.—A discussion of sheltered workshops, their general purposes and goals, the types of people they serve, and the assumptions underlying the expressed need for such protected work situations.—*E. Y. Beeman.*

1559. Patterson, C. H. (U. Illinois) **Evaluation of the rehabilitation potential of the mentally ill patient.** *Rehabil. Lit.*, 1962, 23(6), 162-172.—Vocational rehabilitation constitutes an important segment of the total rehabilitation of the emotionally disturbed. In client selection and evaluation: (a) neither diagnosis nor symptomatology are highly related to successful vocational rehabilitation; (b) the most useful predictors are those which sample occupationally relevant behavior; (c) various approaches to evaluation seem desirable; (d) selection is a progressive procedure; (e) the selection process must be adapted to the individual patient and his situation, potentialities, and goals; (f) the rehabilitation counselor should be involved in the selection process from the beginning. (78-item bibliogr.)—*W. D. Kerr.*

1560. Ramon, A. C. **The effect of rapid culture change on mental health.** *World ment. Hlth.*, 1960, 12(4), 152-162.—A comparison of 2 villages in Mauritius—Triplet and Stanley—shows "that acculturation, when rapid and extensive, has a damaging effect on mental health and results in increase of mental illness; an uneven rate of deculturation is more damaging than mere rapidity." Results show "That in order to minimize the ill effects of rapid acculturation, the Government and society must satisfy the emotional needs of the people for grouping, by providing facilities which will permit good socially-accepted groupings to be formed."—*J. C. Franklin.*

1561. Rapoport, Robert. **Community as doctor: New perspectives on a therapeutic community.** Springfield, Ill.: Charles C Thomas, 1961. x, 325 p. \$9.75.—A report of socioanthropological research on Maxwell Jones' Social Rehabilitation Unit in England. Descriptions and analyses are given of the ideology of the unit, the system of staff and social roles, organization of patient activities, patient reactions, and the involvement of the family in treatment and rehabilitation. A conceptual distinction between treatment goals and rehabilitation goals is developed. 30 postulates are developed as general principles for the development of therapeutic milieux in other contexts.—*E. Zollik.*

1562. Rivière, Maya. (Ass. Aid Crippled Children, NYC) **Rehabilitation codes: Five-year progress report, 1957-1962.** New York: Rehabilitation Codes, 1962. 174 p.—A 5-year progress report on the Office of Vocational Rehabilitation-supported project concerned with the development and field testing of codes for the serial recording of information essential to the rehabilitation process. These codes permit punchcard translation of the personal history, health history, impairment-etiology, and evaluation-

service data contained in the rehabilitants record. They thus provide a means for data-processing and advance the possibility for research in an area of clinical importance that has long suffered from uniformity of data reporting. Well over 100 experts in such areas as communicative disorders, psychosocial function, visual function, vocational terminology, research and statistics, and the general field of rehabilitation have served on the committees assisting the director of the project in the development of the codes thus far. The manual contains the codes enabling those engaged in fieldtesting to try them out and make such changes as experience indicates necessary.—*M. A. Seidenfeld.*

1563. Shock, N. W. (National Inst. Health, Bethesda, Md.) **Rehabilitating the aged: A physiologist looks at the problem.** *J. Rehabil.*, 1962, 28 (2), 16-18.—A brief review of the problems and advancements made in the field of rehabilitating the aged.—*M. A. Seidenfeld.*

1564. Sorrentino, Juan G. **El rol del individuo frente a los desórdenes de la conducta.** [The role of the individual in the face of behavioral disorders.] *Acta neuropsiquiat. Argent.*, 1961, 7(3), 206-207.—The function of social roles in the formation of personality is discussed. The intrapsychic and emotional needs must be integrated with the role in which one confronts the ambient social environment. The healthy personality achieves a certain flexibility in adapting these roles to changing circumstances, and the failure to do so is a source of frustration and anxiety.—*W. W. Meissner.*

1565. Srole, Leo; Langner, Thomas S., Michael, Stanley T., Opler, Marvin K., & Rennie, Thomas A. C. (State U. New York Medical Center, Brooklyn) **Mental health in the metropolis: The midtown Manhattan study.** Vol. 1. New York: McGraw-Hill, 1962. xii, 428 p. \$9.95.—This is the 1st of a 3-volume series based on an 8-year research study of the midtown population of Manhattan. The study was carried out by a collaborating team of social scientists and psychiatrists. It is "a sociological study with medical orientation. The central reference point is an estimate of mental health; its central theme the etiology of mental illness; its sociological concern the amount, quality, and adequacy of psychiatric treatment." Weighing the effects of the great tide of social change in the United States since 1900, the authors suggest that there is "a likely net effect of large-scale improvement in the over-all health composition of the American people." Part I identifies the major conceptual and procedural instruments used. Part II delineates the population composition and psychosocial climate of the community studied. Part III scrutinizes the mental health and psychiatric care of midtown Manhattan and compares them with results yielded by investigation of other populations. Part IV has overall commentaries on the study by Michael and Srole.—*H. Feifel.* •

1566. Strojilevich, Mario. **La santé mentale du stagiaire étranger.** [The mental health of foreign students.] *Hyg. ment.*, 1961, 50(6), 393-397.—Foreign students were studied in regard to attitudes toward departure, attitudes upon arrival, adaptive mechanisms, and problems posed by return. 2 groups were considered: those who were forced out of their native land and thus took up more or less permanent

residence unwillingly, and those who came willingly and on a more temporary basis.—*W. W. Meissner.*

1567. Wechsler, Henry. (Harvard U.) **The ex-patient organization: A survey.** *J. soc. Issues*, 1960, 16(2), 47-53.—Ex-patient clubs of former mental patients have seen a rapid growth in the last 10 years, possibly reflecting the "other-directed" tenor of today's society. The article discusses these organizations, their underlying assumptions, types of leadership, membership, services, and problems encountered.—*E. Y. Beeman.*

1568. World Federation for Mental Health. **Mental health and international perspective.** London, England: WFMH, 1961. 84 p. \$.25.—Review of dimensions of mental health as affected by changing cultural aspects since 1948: the acculturation of population growth and pressures, the emergence and technological development of new nations, the effects of increased automation in industrialized countries, consequences of greater facilities for transportation and communication, and present trends in the treatment of mental illness and prevention of mental disorder.—*E. L. Gaier.*

1569. Yaphe, Ruth. (Shalvata Hosp., Magdiel) **Histaglutam shel nitsoley hamishtar hanatsi aharey aliyatam leyisrael.** [Mental adjustment of the survivors of the Nazi régime after immigrating to Israel.] *Dap. refuim*, 1962, 21, 127-130.—4 cases are described illustrating 4 patterns of reaction: those who don't want to forget; who are not able to forget; who seemingly forget, but as a matter of fact are troubled by unconscious memories; and who are well adapted to the new conditions in Israel (most of the survivors). (English & French summaries)—*H. Ormian.*

1570. Zigler, E., & Phillips, L. (Yale U.) **Social competence and outcome in psychiatric disorder.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 264-271.—Relationship of premorbid social competence of patients necessitating hospitalization to length of hospitalization, frequency of hospitalization, and time between hospitalizations was studied. Case histories of 251 patients were analyzed. As with previous studies, a positive relationship between the variables was found. Those at the lower end of the social competence continuum had longer periods of hospitalization and greater likelihood of rehospitalization. Social competence was therefore seen to be related to prognosis. Results were discussed in terms of developmental approach to personality and, in particular, psychopathology.—*G. Frank.*

ABNORMAL PSYCHOLOGY

1571. Bliss, Eugene L., & Clark, Lincoln D. (U. Utah) **Visual hallucinations.** In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 92-107.—A summary of work dealing with the effects of sensory isolation, sleep deprivation, LSD-25, delirium tremens, and schizophrenia with respect to visual hallucinations. The data suggest 3 general varieties of abnormal visual experience: (a) some normal people have the capacity for visions, which is "enhanced by reverie, isolation, and darkness." These visions are usually realistic and monochromatic or pale in color. (b) Visions of hypnagogic states, dreams, and sleep deprivation. These states share the elements of semi-mnolence and altered electroencephalographic ac-

tivity. (c) The third category are the visions induced by hallucinogenic agents, and withdrawal from depressant drugs. (18 ref.)—*J. B. Thompson.*

1572. Eisenberg, Leon. (Johns Hopkins U.) *Hallucinations in children.* In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 198-208.—A discussion of "hallucinatory phenomena in children with an emphasis on their relevance to a general theory of hallucinations." (39 ref.)—*J. B. Thompson.*

1573. Essen-Möller, Erik. (U. Lund, Sweden) *On classification of mental disorders.* *Acta psychiat. Scand., Copenhagen*, 1961, 37(2), 119-126.—The simultaneous use of both syndromatic and etiologic classifications of mental disorders is advocated in order to end the inconsistency, contamination, and divergency entailed in customary classifications. The proposed system is illustrated. It provides more possibilities for the combination of different syndromes and etiologies, stimulating awareness of "atypical" constellations by breaking up inveterated conventions and misconceptions and eliminating meaningless compromise between divergent schools.—*R. Kaelbling.*

1574. Evarts, Edward V. (National Inst. Health, Bethesda, Md.) *A neurophysiologic theory of hallucinations.* In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 1-14.—A review is presented of philosophical speculations, neuropsychological theories, and neurophysiologic contributions concerning hallucinations. The hypothesis is offered that "some hallucinations are correlative with a neurophysiologic process similar to one which occurs during sleep, and which consists of abnormality brisk discharges of centers involved in waking perception." (24 ref.)—*J. B. Thompson.*

1575. Fisher, Seymour. (State U. New York) *Body image boundaries and hallucinations.* In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 249-257.—"Various findings . . . [are] cited which indicate a correlation between poor body boundary demarcation and the occurrence of hallucinatory phenomena." Phantom sensations, schizophrenic disorganization, and hallucinogenic drug effects are discussed. (24 ref.)—*J. B. Thompson.*

1576. Gillibert, J. (60, rue Velpeau, Antony, Seine) *L'ontogenèse en psychopathologie.* [Ontogenesis in psychopathology.] *Evolut. psychiat.*, 1961, 26(4), 477-510.—In a philosophical discourse, the author criticizes genetical and evolutionary models as too simple to explain the creativity of being. Neuroanatomical evidence by Bolk is cited as invalidating these models. A historical summary points out the trend in Western philosophy which considers thought as "being" and "thinking." This concept is traced through Moses, Sophocles, Plato, Pascal, 19th-century French poets such as Mallarmé and Baudelaire, and to modern existentialists such as Heidegger. However, the emphasis is upon Freud, whose therapy is founded upon the relationship of being—a dynamic unconscious which is beyond casual and scientific explanation.—*L. A. Ostlund.*

1577. Goldstone, Sanford. (Baylor U.) *Psychophysics, reality and hallucinations.* In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 261-272.—A presentation of "a psychophysical point of view that departs from the classical stimulus-centered sensory psychology" and a demonstration of "the potential of the relevant methods and formula-

tions that permit the derivation of quantitative information about the functioning and malfunctioning of internal standards or concepts." 2 hypotheses are suggested to partially account for hallucinations: (a) "a partial reduction in intersensory stimulus received by one mode may be interpreted in terms of a less appropriate mode," and (b) "a partial reduction in the subject's ability to make contemporary use of past experience because his internal standard has become less available or less vivid." (35 ref.)—*J. B. Thompson.*

1578. Masserman, Jules H. (Northwestern U.) *Principles of dynamic psychiatry: Including an integrative approach to experimental and clinical psychology.* (2nd ed.) Philadelphia, Pa. Saunders, 1961. xxi, 332 p. \$8.00.—A revision of the 1946 introductory text. About "half the 1200 references of the original bibliography have been replaced by more recent and more comprehensive contributions. . . . The discussions on combat neuroses and wartime morale have . . . been deleted (and in) their place are entirely new sections on ethology . . . information and systems theory . . . disturbances of communications . . . and the evolution of psychotherapy."—*C. T. Morgan.*

1579. Myers, Thomas I., & Murphy, Donald B. (Human resources Research Office, Monterey, Calif.) *Reported visual sensation during brief exposure to reduced sensory input.* In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 118-124.—40 Ss wearing opaque goggles were placed on a bed in a semi-light-proofed room for 10-25 min. $\frac{1}{2}$ of the Ss had prior Rorschach experience. $\frac{1}{2}$ of the Ss in each of these groups were told that visual sensations in the absence of light were normal; and the other Ss were told that such experience was only reported by psychiatric patients. Results indicated that nonpsychiatric Ss report visual sensations under minimal deprivation. The type of instruction significantly influenced the frequency and complexity of reported visual sensations. The degree to which things were seen on Rorschach cards was not significantly related to the frequency of complex visual sensation.—*J. B. Thompson.*

1580. Orme, J. E. (Middlewood Hosp., Sheffield, England) *Time estimation and personality.* *J. ment. Sci.*, 1962, 108(453), 213-216.—For groups of 30 for each clinical entity, and for estimates of 30-minute and 20-minute filled intervals, psychopathic and hysterical groups give longer estimates than controls, while neurotic and psychotic depressives give shorter estimates.—*W. L. Wilkins.*

1581. Post, Felix, & Wardle, Joan. (Bethlem Royal Hosp., London, England) *Family neurosis and family psychosis.* *J. ment. Sci.*, 1962, 108(453), 147-158.—Scrutiny of the experimental literature on the influence of the mentally ill on other members of the family or of the family on the patient, whether adult or child, indicates that although much of the literature is poorly conceived—sometimes because of being prematurely concerned to prove some basic theoretical construct—the problems are crucial to the understanding of mental health, and much more research is needed. (57 ref.)—*W. L. Wilkins.*

1582. Rögler, Lloyd H., & Hollingshead, August R., (U. Puerto Rico) *Class and disordered speech in the mentally ill.* *J. Hlth. hum. Behav.*, 1961,

2(3), 178-185.—The hypothesis was tested that there are relationships between social class and the communication of ideas by mentally ill persons. By means of probability sampling in San Juan, Puerto Rico, 303 interviews were completed with people who had sought psychiatric aid. The data supported the hypothesis. The clearest findings were (a) as the level of education increases there is a greater tendency to seek psychiatric aid, and (b) schizophrenic incoherence is correlated with lowerclass status. It was concluded that "incoherence in communication may be a social-psychological reaction to sociocultural stress."—*L. A. Ostlund.*

1583. **Schlesinger, Benno.** (Mount Sinai Hosp., N. Y.) **Higher cerebral functions and their clinical disorders.** New York: Grune & Stratton, 1962. xiv, 560 p. \$14.75.—The purpose of this book is to present in a comprehensive fashion the anatomic and neurophysiological background for psychology and psychiatry. Major topics covered are: basic concepts, affectivity, thought, skill, and art. Selected examples of more specific topics discussed include: neurosis and psychosis, the schizophrenias, frontal lobe disease, nature of thought, biological brains compared with electronic brains, integration of skilled movements, disorders of recognition and skill, and disorders of language.—*B. Martin.*

1584. **Scheibel, Madge E., & Scheibel, Arnold B.** (U. California.) **Hallucinations and the brain stem reticular core.** In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 15-32.—Previous work suggests that hallucinations may develop in relation to changes in the incoming sensory data, possibly in the receptors, or to abnormality in the CNS, from brain stem to cortex. Present data suggest that the reticular formation influences the post synaptic dendrites of these systems. "... the level of dendritic activity ... tends to bias the neuron ... modulating its response to specific sensory inputs. ... Hallucinatory phenomena ... may represent a pathophysiologic response of brain tissue to changes in dendrite-soma equilibrium, wherein externally valid sensory information receives decreasing weight in relation to internal elaborations." (51 ref.)—*J. B. Thompson.*

1585. **Strauss, Erwin W.** (VA Hosp., Lexington, Ky.) **Phenomenology of hallucinations.** In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 220-231.—"Hallucinations are not a mere addition ... in a normal modality. They originate in distorted modalities." Hallucinations "signify pathological modes of being-in-the-world. Here phenomenology is the method of choice. Instead of explaining behavior by means of physiologic hypotheses ... phenomenology tries to understand the mentally sick, understanding first the norm of Man as an experiencing being."—*J. B. Thompson.*

1586. **Weinstein, Edwin A.** (Walter Reed Army Inst. Research, Washington, D. C.) **Social aspects of hallucinations.** In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 233-238.—"Data of hallucinations and delusions were gathered from patients who were hospitalized in the psychiatric ward of a small general hospital" in the American Virgin Islands over an 18 month period. Differences in 4 cultural groups and various hallucinations are described. Observations indicate that the hallucinations "are not bizarre or exotic phenomena, but are ...

a part of a fabric of the society in which they occur. An hallucination is a highly condensed symbol that has the quality of reality because it is an element in a pattern of social relatedness."—*J. B. Thompson.*

1587. **West, Louis J.** (U. Oklahoma.) **A general theory of hallucinations and dreams.** In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 275-290.—"In the normal waking state, our brains are under constant bombardment by information ... derived ... from stimuli. ... This input of new information has an inhibiting effect on the emergence into awareness of previous perceptions. If the input is sufficiently decreased perceptual engrams may be released. If ... there is ... vivid awareness, the released perceptions may be ... reexperienced as fantasies, dreams, or hallucinations." (38 ref.)—*J. B. Thompson.*

1588. **West, Louis Jolyon. (Ed.)** (U. Oklahoma.) **Hallucinations.** New York: Grune & Stratton, 1962. viii, 295 p. \$9.95.—The joint American Psychiatric Association-AAAS symposium on hallucinations was held in December 1958. Topics included a neurophysiologic theory of hallucinations; the role of the brain stem reticular formation; pharmacodynamics of hallucinations; comparison of drug induced and psychotic hallucinations; hallucination in sleep deprivation, visual hallucinations; hallucinations in schizophrenia; hallucinations in children; hypnotically induced hallucinations; phenomenology of hallucinations; social aspects of hallucinations; phantom sensations; psychophysics, reality, and hallucinations; and a theory of hallucinations and dreams. (see 37: 310, 318, 319, 320, 321, 324, 325, 640, 653, 654, 1459, 1571, 1572, 1574, 1575, 1577, 1579, 1584, 1585, 1586, 1587, 1642, 1646, 1802, 1817, 1822)—*J. B. Thompson.*

PHYSICAL HANDICAPS

1589. **Bell, A. H.** (VA Area Office, Atlanta, Ga.) **Attitudes of selected rehabilitation workers and other hospital employees toward the physically disabled.** *Psychol. Rep.*, 1962, 10(1), 183-186.—A group of 30 hospital employees with disabled relatives or friends scored significantly higher on an Attitude Toward Disabled Persons Scale (ATDP), indicating greater acceptance, than did 2 groups without close personal ties to disabled persons. Of Ss without personal ties, a group of 40 rehabilitation workers did not differ from a group of 40 hospital employees not engaged in therapeutic work in ATDP scores. Various interpretations of the test are discussed in the light of these results.—*B. J. House.*

1590. **Cohn, Nancy.** (U. Houston.) **Understanding the process of adjustment to disability.** *J. Rehabil.*, 1961, 27(6), 16-18.—Adjustment of the disabled to their somatopsychological problems are explained utilizing the familiar models of Lewin, Meyerson, and others to explain the interrelationship between the disabled and their individual environmental milieu.—*M. A. Seidenfeld.*

1591. **Cowen, E. L., Underberg, R. P., Verillo, R. T., & Benham, F. G.** (U. Rochester.) **Adjustment to visual disability in adolescence.** New York: American Foundation Blind, 1961. xiii, 239 p. \$4.50 (cloth), \$2.50 (paper).—A description of a 3-year research program on the sociopsychological aspects of visual disability. The experimental group of 127 visually disabled adolescents included 71 living

at home and attending public school facilities and 56 attending residential schools for the blind. A control group of 40 sighted adolescents was used. Data were collected from the mothers of all adolescents and from about 40% of the fathers. Child adjustment, parental attitudes, and parental understanding were measured with available and newly developed instruments. The groups were strikingly similar in their adjustment, and the findings severely challenge "Any prior beliefs about inevitable contingencies between visual disability and maladjustment." Publicly expressed maternal attitudes are ill-suited as predictors of adjustment in the child, while maternal understanding correlates highly with child adjustment. (236 ref.)—*B. Lowenfeld*.

1592. Figuerola Román, Miguel. *El niño minorado y la organización familiar*. [The handicapped child and the organization of the family.] *Acta neuropsiquiat. Argent.*, 1961, 7(3), 197-198.—The presence in the family of a child handicapped for either physical or mental reasons creates tremendous conflicts and an atmosphere of tension in the family. Some of the effects on the nuclear family and their dynamics are discussed.—*W. W. Meissner*.

1593. Garelli, Maritha; Meyer, Jeannine, & Rossi, Pierrette. *Du réel à l'imaginaire*. [From the real to the imaginary.] *Enfance*, 1961, No. 4-5, 361-401.—Children who have had poliomyelitis present the problem of how development of intelligence, perception, and affectivity may best be fostered in a hospital environment. A picture-story test was used with 60 boys and 60 girls, ages 6-11½, who were hospitalized, and a like number of children of the same ages who were attending school and who were not handicapped. The significant differences supported the conclusions that the handicapped suffer from environmental impoverishment and associated disinterest. Reduced ability to manipulate objects and move about contributes to an unreal view of the environment and reliance upon a life of reflection. Pessimism is noted especially in the stories of older girls. Extensive tabulation of results is included.—*S. S. Marzolf*.

1594. Garelli, Maritha, & Pousseur, Nicole. *Ré-éducation et rééducateurs*. [Re-education and re-educators.] *Enfance*, 1961, No. 4-5, 381-401.—The attitude of the handicapped person toward his handicap, his re-education, and his return to a more or less normal life depends much upon the attitudes of re-educators. The latter were surveyed with a questionnaire concerning their observations of an experimental group of 60 boys and 60 girls ages 6-12, (hospitalized post-poliomyelitis patients) and a similar group of 45 boys and 45 girls above 12 years old. The results are considered useful in helping the re-educators realize how important their own attitudes are in the rehabilitation process.—*S. S. Marzolf*.

1595. Holden, Raymond H. (Meeting Street School Children's Rehabilitation Center, Providence, R. I.) *Changes in body image of physically handicapped children due to summer camp experience*. *Merrill-Palmer Quart.*, 1962, 8(1), 19-26.—Body image changes were inferred from changes in global ratings of human figure drawings. Changes in counselors' ratings on behavior rating scales correlated significantly with judges' choice of better figure drawings. (20 ref.)—*E. L. Robinson*.

1596. Holden, Raymond Henry. (Boston U.) *Changes in body imagery of physically handicapped children due to summer camp experience*. *Dissert. Abstr.*, 1961, 21(10), 3165.—*Abstract*.

1597. Irwin, Jack Menzenwerth. (Cornell U.) *A study of certain personal and social factors differentiating the nonevidently handicapped from the physically normal adolescent*. *Dissert. Abstr.*, 1961, 21(12), 3582-3583.—*Abstract*.

1598. Johnson, Orval G., & Wawrzaszek, Frank. (Lewis County Schools) *Psychologists' judgments of physical handicap from H-T-P drawings*. *J. consult. Psychol.*, 1961, 25(4), 284-287.—House-Tree-Person ratings of 9 psychologists were more closely related to Goodenough score than to the proposed identification of the handicapped child. Significant postdiction of matched pairs required pooling of all judgments.—*E. R. Oetting*.

1599. Lefevre, Lucien. *Les problèmes d'adaptation scolaire posés par les adolescents poliomyélitique*. [Problems of scholastic adaptation posed by poliomyelitic adolescents.] *Enfance*, 1961, No. 4-5, 423-460.—Preliminary review of an extensive study in progress suggests that the adolescent's concern with the degree of his recovery and the energy expended in physical therapy make scholastic instruction difficult. Nevertheless, followup data are encouraging.—*S. S. Marzolf*.

1600. Moed, George; Wight, Byron W., & Vandegrift, Harvey N. (Children's Seashore House, Atlantic City, N. J.) *Studies of physical disability: Reliability of measurement of skeletal age from hand films*. *Child Developm.*, 1962, 33(1), 37-41.—"Several clinicians and academicians read the same set of hand films twice each for skeletal age. Within-judge, between-judge, and between-standards reliability was studied. Although correlations were high, median discrepancies small, and there were no constant directional errors of reading, a few discrepancies were large. Implications of these results for clinical and research work are discussed."—*W. J. Meyer*.

1601. Prechtl, H. F. R., & Stemmer, C. J. (U. Groningen, The Netherlands) *The choreiform syndrome in children*. *Develpm. Med. child Neurol.*, 1962, 4(2), 119-127.—Extensive case history and neurophysiological data were obtained on 50 children, aged 9-12 years, who presented choreiform but no other obvious neurological signs or gross psychiatric symptoms. Electromyographic and gross behavioral findings are reported. In 92% of the children eye muscles also were affected; 90% of the children, all with eye muscle involvement had "more or less severe reading difficulties." For 66% of the group, there had been one or more obstetrical or postnatal problem; the possibility of such problems was suggested in an additional 12%. "The choreiform syndrome seems to be a form of minimal brain damage and falls, by definition, into the category of cerebral palsy. No successful form of drug therapy has yet been discovered."—*T. E. Newland*.

1602. Rossi, Pierette. *L'adaptation psychologique de l'enfant au travail scolaire*. [Psychological adaptation of the child to school work.] *Enfance*, 1961, No. 4-5, 403-421.—Case studies of 39 boys and 37 girls, ages 5-12, led to the conclusion that in spite of many unfavorable factors encountered in long hospitalization (all were hospitalized post-polio-

myelitis patients), the majority of children readjust very well, and that contact with reality is facilitated by assistance of personnel from outside the hospital.—S. S. Marzolf.

1603. Simmel, Marianne L. (New School Social Research, NYC) **Phantom experiences following amputation in childhood.** *J. Neurol. Neurosurg. Psychiat.*, 1962, 25, 69-78.—"Data from several groups of young amputees indicate that phantoms are rarely reported if the amputation was performed before the age of 4 years; thereafter, their incidence increases, and phantoms follow predictably upon amputation at or above 8 years. . . . In a group of children who had undergone amputation of congenitally malformed extremities it could further be shown that phantoms occur only if there has been some sensory and/or motor function before the loss of the misshapen limb. It was suggested that the crucial variable here is kinaesthetic and/or deep pressure sensitivity. These findings were shown to support the hypothesis that the body schema which gives rise to the amputation phantom is basically a postural schema." (31 item-bibliogr.)—M. L. Simmel.

1604. Smith, Alathena Johnson. (Ohio State U.) **Performance of subjects aged two to four on non-verbal tasks presented in pantomime: A phase in the development of a test for the clinical appraisal of hypacoustic and other language-handicapped children.** *Dissert. Abstr.*, 1961, 21(11), 3529.—*Abstract.*

1605. Sopp, H. (Bismarckstr. 43, Düsseldorf, Germany) **Sozialanalyse des Krankenstandes.** [Social analysis of disability.] *Z. psycho-som. Med.*, 1961, 7(3), 204-207.—During economic booms an overall numerical increase in disabilities may be due to (a) increased hazards caused by increased industrial productivity and stepped-up working demands, with their pathogenic effects on the human organism or (b) the wish for income without work. Disability does not represent sickness in the classic sense of the word but a disturbance in well-being projected into the sphere of somatic feeling. The introduction of social-psychological teleology into the etiology of trivial industrial sicknesses is in contradiction to the accepted medical category of causality. More field work must be done to clarify the relation between the social sphere and medical disability.—I. Neufeld.

1606. Ventur, Pierre August. (Columbia U.) **Some effects of upper extremity prosthetic restoration.** *Dissert. Abstr.*, 1961, 21(12), 3858-3859.—*Abstract.*

1607. Worden, Don Keith. (Western Reserve U.) **The intelligence of boys with muscular dystrophy.** *J. consult. Psychol.*, 1961, 25(4), 369.—The Stanford-Binet, Oral Reading Test, Metropolitan Achievement Test in Arithmetic Fundamentals, were used with pseudohypertrophic muscular dystrophy, amyotonia congenita, diabetic, and diabetic-sibling children. ". . . intellectual deficit seems specifically associated with the factor of having PMD."—E. R. Otting.

Blindness

1608. Hunter, William F. (Michigan State U.) **An exploratory analysis of space perception in congenitally blind and sighted individuals.** *Dissert. Abstr.*, 1961, 21(11), 3530-3531.—*Abstract.*

Deafness

1609. Brill, Richard G. (California School for the Deaf, Riverside, Calif.) **The relationship of Wechsler I.Q.'s to academic achievement among deaf students.** *Except. Child.*, 1962, 28, 315-321.—A statistical study of IQs of deaf children at the California school found that these scales (WISC or WAIS) discriminate well "in terms of ultimate academic achievement of these pupils. The mean intelligence of groups of students receiving academic diplomas, vocational diplomas, or certificates of completion differed significantly. It was also shown that in order to attain an academic diploma a deaf student must be well above average in intelligence and he must fall within the average range to obtain a vocational diploma."—J. Z. Elias.

1610. Falberg, Roger M. (Wichita, Kansas) **An adventure into adult education of the deaf.** *Amer. Ann. Deaf*, 1962, 107(3), 329-338.—Illustratively described in some detail is a 16-week program provided for a group of 9 deaf adults, aged 26-47.—T. E. Newland.

1611. Fuller, Carl W. (Indiana U. Medical Cent., Indianapolis) **Your child, maturity, and you: A talk to parents.** *Amer. Ann. Deaf*, 1962, 107(3), 320-328.—Playing an important role in the extent to which deafness handicaps a child are the parental attitudes (attitude of acceptance and attitude of objectivity) and the child's attitudes (attitude of independence and attitude of confidence) which are operative.—T. E. Newland.

1612. Furth, H. G. (Catholic U. America) **The influence of language on the development of concept formation in deaf children.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 386-389.—To isolate the effect of language development on the development of thinking, children between 7 and 12 who had been deaf since an early age were presented with 3 tasks assessing conceptual functioning. Their performance was compared to that of a relatively comparable group of "hearer." The results indicated that the lack of a capacity to verbalize did not, in itself, interfere with a general capacity for abstract conceptualization.—G. Frank.

1613. Huntington, D., & Ross, M. **The reliability and equivalency of the CIDW-22 Auditory Tests.** *USAF SAM Rep.*, 1962, No. 61-110. 6 p.—33 adult Ss with sensorineural hearing loss were tested for hearing with Lists 1, 2, 3, and 4 of the CIDW-22 Auditory Tests. After a short rest period the Ss were tested again. Reliability coefficients of all the lists were higher than .90. Statistically different mean differences occurred between scores obtained with Lists 1 and 3, 1 and 4, and 2 and 4. The magnitude of the differences among the lists is probably not great enough to be considered clinically, but it should be taken into account in research efforts.—M. C. Payne, Jr.

1614. Ickes, William K. (Des Moines Hearing & Speech Center) **An accuracy indicator for testing hearing.** *J. speech hear. Disord.*, 1962, 27(2), 144-149.—3 adult males and 17 females, with a mean age of 38.1 years, were compared on the basis of results from 2 different hearing tests, one with an "accuracy" indicator and another with a "semantic" indicator. The "accuracy" indicator consisted of a series of 4 lights with the Ss instructed to raise their hands

when the lights were turned on and to indicate the number of the light which was on when the sound was present. The "semantic" parameter was the usual audiometric response of raising hand. The "accuracy" indicator was a better measure of sensory function than the "semantic" indicator and sometimes resulted in lowering mean thresholds as much as 6.5 db.—*M. F. Palmer.*

1615. Jerger, James. (Gallaudet Coll.) **Hearing tests in otologic diagnosis.** *ASHA*, 1962, 4(5), 139-145.—Hearing tests are necessary adjuncts to otological diagnosis, but no single test is accurate enough to do the task alone. A very useful multiple-test battery consists of SISI, Bekesy Audiometry, and the ABLB Test.—*M. F. Palmer.*

1616. Kates, Solis L., Yudin, Lee, & Tiffany, Ronald K. (U. Massachusetts) **Concept attainment by deaf and hearing adolescents.** *J. educ. Psychol.*, 1962, 53(3), 119-126.—The purpose was to investigate concept attainment by deaf and hearing adolescents. There were 30 deaf Ss matched first with 30 hearing Ss on sex, age, and IQ and then with 30 hearing Ss on sex, school achievement, and IQ. All Ss were tested individually on 6 concept problems. The conclusions were: (a) deaf Ss manifest capability equal to hearing Ss in tying together sensory impressions and in making use of these integrated sensory impressions to classify new objects, (b) deaf Ss show greater cautiousness in taking the initial step in problem solving, (c) deaf and hearing Ss proceed in concept attainment tasks by the use of similar strategies.—*Journal abstract.*

1617. Mira, Mary P. (U. Kansas Medical Cent.) **The use of the Arthur Adaptation of the Leiter International Performance Scale and the Nebraska Test of Learning Aptitude with pre-school deaf children.** *Amer. Annals Deaf*, 1962, 107(2), 224-228.—Test-retest data on 18 children showed a statistically significant (.016 level of confidence) increase in IQ over a time interval of roughly 1.5 years. 9 of the children had gains of 10-60 IQ points. The possibility of a clinical selective factor contributing to this condition is recognized. Leiter-Nebraska IQ's correlated .77 on 60 cases, the average 12 points higher than the Leiter (with roughly comparable sigmas). 36 of the children earned Nebraska IQs 10-30 points higher than the Leiter; in 3 instances, the Nebraska IQs were 10-20 points lower.—*T. E. Newland.*

1618. Nagel, Robert F. (School Medicine, Yale U.) **Audiology and education of the deaf.** *J. speech hear. Disord.*, 1962, 27(2), 188-190.—The 1961 directory of the American Speech and Hearing Association indicates there are approximately 360 persons in the United States certified in the area of hearing. Not one of these persons was required to complete any academic course work related to the deaf. Audiologists should become familiar with the techniques of education of the deaf at all levels.—*M. F. Palmer.*

1619. Reed, G. F. (U. Manchester) **Psychogenic deafness, perceptual defense, and personality variables in children.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 663-665.—"Survey of a child guidance population showed that of 26 functionally hard-of-hearing cases, 14 presented elevated thresholds for pure tones but were within normal limits for speech. The other

group, though normal on pure-tone testing, presented elevated thresholds for all speech, rather than for relatively threatening stimuli. It would appear that both groups were reactive to situations, as opposed to specific auditory stimuli within those situations. Furthermore the majority of the pure-tone group were clinically classified as 'hysteric,' whereas the majority of the speech group was classed as 'anxiety state.' The applicability of 'defense' theories to such cases is discussed.—*G. Frank.*

1620. Stafford, Kenneth. (Arizona State U.) **Problem-solving ability of deaf and hearing children.** *J. speech hear. Res.*, 1962, 5(2), 169-172.—16 congenitally deaf boys and 13 congenitally deaf girls, ranging in age from 6 to 17 years and in mental age from 6 to 21 years, were matched with hearing children according to IQ, age, and sex, and their performances on a problem box compared. The performance of the hearing children was better except in one comparison, namely, that in which the deaf in the highest third of the chronological-age, mental-age range solved the same problems more readily.—*M. F. Palmer.*

1621. Wodin, Martin Henry. (New York U.) **An examination of perceptual and cognitive rigidity in deaf adolescent boys.** *Dissert. Abstr.*, 1961, 22(1), 329.—*Abstract.*

SPEECH DEFECTS

1622. Aron, Myrtle L. (U. Witwatersrand, Johannesburg) **The nature and incidence of stuttering among a Bantu group of school-going children.** *J. speech hear. Disord.*, 1962, 27(2), 116-128.—The incidence and nature of stuttering was explored among 3105 male and 3476 female Bantus attending the schools in Orlando Township, Johannesburg, South Africa. The total number of Ss interviewed and established as being stutterers was 83, consisting of 62 males and 21 females. Percentage incidence of stuttering for school population was 1.26. Terms to describe stuttering were present in the various Bantu languages. Some secondary differences were observed in the accompanying struggle reactions in scholastic retardation and in the occupations of the parents of African stutterers. There are, however, no significant differences from western European populations.—*M. F. Palmer.*

1623. Bas, Edin. **Hayeled hailmi vedarkhey horaato.** [The aphasic child and ways to teach him.] *Hahinukh*, 1961-62, 34, 145-146.—Recently in the United States, aphasic children have been grouped in special classes apart from deaf children. W. C. Bargert's experiences are described. Disturbances in reading, pronouncing, and writing are analyzed; and ways of moving slowly from methods used with deaf children to those used with normal children are suggested.—*H. Ormian.*

1624. Dickson, David Ross. (Northwestern U.) **An acoustic study of nasality.** *J. speech hear. Res.*, 1962, 5(2), 103-111.—20 speakers classified as having functional nasality and 20 speakers with cleft palates were compared with 20 normal adult males on the nasality present in the vowels (i) and (u), each vowel being preceded by a carrier wave. No means were found to differentiate nasality in cleft-palate and non-cleft-palate individuals either in terms of their acoustic spectra or the variability of the nasality

judgments. 3 basic factors were inconsistently related to the nasal vowel spectra. These were loss of power, increased damping, and the addition of resonance and antiresonance.—*M. F. Palmer.*

1625. Engelberg, Marvin. (VA, Cleveland, O.) **Correction of falsetto voice in a deaf adult.** *J. speech hear. Disord.*, 1962, 27(2), 162-164.—Success in the correction of a falsetto voice in a deaf adult came from explaining through visual, tactile, and kinesthetic stimuli the differences in the physiological functionings of the vocal musculature between falsetto and normal pitch levels and utilizing vocal retraining techniques. The S was told that the larynx moved upward with an increase in pitch. There is relatively more perceptible chest resonance at lower pitches than at higher ones and relatively more perceptible resonance and kinesthetic stimuli at lower pitches than at higher ones. Hyperextension of the head was used, phonating in lower pitches, phonating in highest pitches, and dropping suddenly to the lowest pitch with relaxation. Relaxed phonation stressed continually.—*M. F. Palmer.*

1626. Froeschele, Emil. (Grand Central Hosp., NYC) **A survey of European literature in speech and voice pathology.** *ASHA*, 1962, 4(6), 172-181.—Review of European literature on speech and voice pathology. (200 ref.)—*M. F. Palmer.*

1627. Gardner, Warren H. (Cleveland Clinic Found.) **The whistle technique in esophageal speech.** *J. speech hear. Disord.*, 1962, 27(2), 187-188.—Use of a whistle blowing 1 blast for "yes" and 2 for "no" gives a good idea in esophageal speech techniques to the patient of how to store and use compounded air.—*M. F. Palmer.*

1628. Goda, Sidney. (Burke Found. Rehabilitation Center, White Plains, N. Y.) **Spontaneous speech, a primary source of therapy material.** *J. speech hear. Disord.*, 1962, 27(2), 190-192.—It is practical to use the spontaneous samples of dysarthric and aphasic adults as the material for developing clinical sessions. The clinician is urged not to rely on drill materials prepared for mass usage.—*M. F. Palmer.*

1629. Hill, Milton J., & Hagerty, Robert F. (Medical Coll. South Carolina) **Speech following pharyngoplasty in postoperative cleft palate subjects.** *J. speech hear. Res.*, 1962, 5(2), 179-184.—Lateral skullfilms and speech samples were obtained of 20 Ss with postoperative cleft palates before pharyngoplasty, one month after, and one year later. The amount of improvement in velopharyngeal contact was determined by measurements of tracings. The results indicate that forward displacement of the pharyngeal wall is an effective procedure for improving velopharyngeal contact and speech of Ss with postoperative cleft palates.—*M. F. Palmer.*

1630. Keenan, Joseph S., & Barret, George C. (Hearing & Speech Center, North Carolina Baptist Hosp.) **Intralaryngeal relationships during pitch and intensity changes.** *J. speech hear. Res.*, 1962, 5(2), 173-178.—6 male and 6 female college Ss ranging in age from 19 to 29 years were studied for vertical movements of the larynx in pitch and intensity changes. Measurements taken suggest that pitch is dependent upon length of the vocal bands, but not upon the vertical position of the larynx. There may

also be important sex differences of laryngeal function in producing intensity changes.—*M. F. Palmer.*

1631. Moore, G. Paul; White, Frazer D., & von Leden, Hans. (Northwestern U.) **Ultra high speech photography in laryngeal physiology.** *J. speech hear. Disord.*, 1962, 27(2), 165-171.—Description of the techniques of high speed photography and laryngeal physiology. Such photography has proved a valuable technique in research as well as in clinical diagnosis and therapy.—*M. F. Palmer.*

1632. Morris, Hughlett L. (U. Iowa) **Communication skills of children with cleft lips and palates.** *J. speech hear. Res.*, 1962, 5(1), 79-90.—107 children with cleft lips and palates were compared to appropriate norms on 17 language and nonlanguage variables. There were no significant differences in communicative abilities between children with cleft lips and palates and children with cleft palates only. The cleft-lip-and-palate children were significantly retarded in communicative skills. There were no differences between the cleft-lip-and-palate and cleft-palate-only groups in strength of relationships among the variables. Significant intercorrelations were obtained among measures of communicative skill, but no single measure could be used as an index of general status of language development.—*M. F. Palmer.*

1633. Powers, Gene R. (U. Connecticut) **Cine-fluorographic investigation of articulatory movements of selected individuals with cleft palates.** *J. speech hear. Res.*, 1962, 5, 59-69.—"Factors [were investigated] . . . which might differentiate individuals with cleft palates who had similar velopharyngeal adequacy, as determined from single-exposure X-ray films, but who had dissimilar articulation ability. . . . 14 Ss were tested and, on the basis of single-exposure X-ray data, placed in a good closure (Group A) or poor closure (Group B) group. . . . Systematic differences between the Ss in Group A were observed in oral structure ratings, site of velopharyngeal closure, tongue carriage, and mouth opening. Differences between the Ss in Group B were observed in alar constrictions, oral breath pressure, patterns of tongue movements, tongue carriage, and mouth opening.—*M. F. Palmer.*

1634. Prins, T. David. (U. Michigan Speech Clinic) **Analysis of correlations among various articulatory deviations.** *J. speech hear. Res.*, 1962, 5(2), 152-160.—92 children between the ages of 3 and 7 years with defective articulation, no organic deviations, and IQs of 85 or above were studied for correlations among measures based upon 28 specific types of articulatory deviations and 2 selected non-speech variables—socioeconomic status and intelligence. There was a heterogeneity within the experimental population. 3 subgroups were identified by clinically familiar articulatory deviations: Group 1, the interdentalization of (s) and (z); Group 2, omission-type deviations; Group 3, phonemic sound substitutions.—*M. F. Palmer.*

1635. Prins, T. David. (U. Michigan Speech Clinic) **Motor and auditory abilities in different groups of children with articulatory deviations.** *J. speech hear. Res.*, 1962, 5(2), 161-168.—92 children with defective articulation ranging in age from 3 through 6 years, misarticulating a minimum of 3 consonant sounds without any known organic deviation, normal hearing sensitivity, and normal IQs,

were studied in relationship to motor and auditory test scores, socioeconomic status, and intelligence. There was a heterogeneity of the population. There was depressed performance in selected motor skills and digit span related to omission-type articulatory errors with an additional depression of socioeconomic status and intelligence.—*M. F. Palmer.*

1636. Ruben, Henry J., & Lehrhoff, Irwin. (Cedars Lebanon Hosp., Los Angeles) Pathogenesis and treatment of vocal nodules. *J. speech hear. Disord.*, 1962, 27(2), 150-161.—Vocal nodules may indeed be the classically described small fibrous tumefactions on the margins of the vocal folds. They also may not be, since there is much variation in size, shape, consistency, color, mobility, location, and histopathologic composition, with further dissimilarity in etiology and preferential management. Suggestions for therapy are given. The term "vocal nodules" is a useful one but meaningful only if rightly comprehended.—*M. F. Palmer.*

1637. Sheehan, Joseph G., Cortese, Peter A., & Hadley, Robert G. (U. California, Los Angeles) Guilt, shame and tension in graphic projections of stuttering. *J. speech hear. Disord.*, 1962, 27(2), 129-139.—48 stutterers, ranging in age from 11 to 44 and containing 36 males and 12 females, were asked to draw what they felt to be their behavior before, during, and after a moment of stuttering. Results were presented separately and at random. 6 speech therapist judges and 6 classroom teacher judges rated drawings as to degree of guilt, tension, shame, and dejection. Guilt appeared at all 3 points of stuttering sequence, especially marked in periods after blocks. Greatest amount of tension occurred during the block and least after increases in shame. Dejection frequently occurred after stuttering. There were marked differences in individual patterns.—*M. F. Palmer.*

1638. Sherman, Dorothy, & Jensen, Paul J. (U. Iowa) Harshness and oral-reading time. *J. speech hear. Disord.*, 1962, 27(2), 172-177.—15 adult males with harsh voices were matched with 15 normals reading orally at conversational level for 1½ hours followed by ½ hour of silence. The harsh-voice group showed no noticeable change in severity of perceived harshness over the periods of oral reading and silence.—*M. F. Palmer.*

1639. Sommers, Ronald K. (Montgomery County, Pa.) Factors in the effectiveness of mothers trained to aid in speech correction. *J. speech hear. Disord.*, 1962, 27(2), 178-186.—8 experimental groups of 10 children each were given the McDonald "deep test" of articulation before and after a period of speech correction. A 3-way analysis of variance indicated, in general, that Ss whose mothers were trained to assist in the correction of misarticulations made greater progress than Ss whose mothers were not trained. Children with higher IQs made more progress than those in the slow learning group. No significant "therapy techniques" were shown by analysis of variance. Measures of the auditory discrimination abilities of the mothers were found to be significantly correlated ($r = .63$) with the amount of improvement shown.—*M. F. Palmer.*

1640. Wingate, M. E. (U. Washington) Evaluation and stuttering: Part I. Speech characteristics of young children. *J. speech hear. Disord.*, 1962, 27(2), 106-115.—A critical review of the evaluational

theory of stuttering, particularly as it refers to the evidence on the speech characteristics of young children and the use of the data so far as support for the theory. Evidence is contrary to the hypothesis that stuttering is the result of some type of evaluation by parents and others.—*M. F. Palmer.*

NEUROLOGICAL DISORDERS

1641. The Ad Hoc Committee on Classification of Headache. Classification of headache. *Arch. Neurol.*, 1962, 6, 13-16.—A special report attempting to relate types of headache to the patient's life situation. It contains a 15-point classification of headaches as "principal manifestation of temporary or sustained difficulties in life adjustment."—*R. Gunter.*

1642. Baldwin, Maitland. (National Inst. Health, Bethesda, Md.) Hallucinations in neurological syndromes. In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 77-85.—Examples of hallucinations occurring in neurologic patients with reference made to epilepsy, temporal lobe lesions and tumors, and electrical stimulation of the temporal cortex.—*J. B. Thompson.*

1643. Chessick, Richard D., & Bolin, Richard R. (VA Hosp., Chicago) Psychiatric study of patients with psychomotor seizures. *J. nerv. ment. Dis.*, 1962, 134(1), 72-79.—"A number of characteristic features were found in a study of 11 patients with 'psychomotor epilepsy.' These were a traumatic early history, a struggle with unresolved conflicts centering around dependency needs, easily aroused rage and destructive impulses which were poorly integrated, lability of affect, an impoverishment of the ego from excessive repression, strong tendencies to deny and project, and a resulting physiologic and psychologic rigidity manifested in everyday thinking and acting."—*N. H. Pronko.*

1644. Colver, T., & Kerridge, D. F. (U. Sheffield, England) Birth order in epileptic children. *J. Neurol. Neurosurg. Psychiat.*, 1962, 25, 59-62.—From all patients diagnosed as epileptics in one hospital between 1947 and 1954, all 1st and 2nd born epileptics were selected for study using 2nd born as a control for 1st born and 1st born as a control for 2nd born. Only cases having suffered convulsions on at least 10 separate days were included, and only pairs observed the same length of time from birth were included. This selection yielded 174 pairs of epileptic cases and their controls, containing 106 1st born epileptics and 68 2nd born epileptics. Breakdown by age of onset revealed 56 1st born and 28 2nd born with onset prior to age 2 years; N was too small for other comparisons. The authors conclude that epilepsy is more frequent in 1st born than in 2nd born children.—*M. L. Simmel.*

1645. Gordon, Neil. (Royal Manchester Children's Hosp.) The investigation of epilepsy. *Dev. Med. Child Neurol.*, 1962, 4(2), 170-179.—The merits and limitations of diagnostic approaches by means of the EEG, by biochemical, neurophysiological, and other procedures are discussed. The necessity in certain areas of repeated studies over a period of time is indicated. (25-item bibliogr.)—*T. E. Newland.*

1646. Klob, Lawrence C. (Columbia U.) Phantom sensations, hallucinations and the body image.

In Louis West (Ed.), *Hallucinations* (See 37: 1588). Pp. 239-246.—"A brief description of the phenomenology of body phantoms, their known frequencies of occurrence after a loss of a body part, a statement of the conditions under which they are not observed, and a brief comment on the physiologic and psychological substratum."—J. B. Thompson.

1647. Magnus, Otto; deVet, A. C., van der Marel, A., & Meyer, E. (Wassenaar, The Netherlands) **Electrocorticography during operation for partial epilepsy.** *Develpm. Med. child. Neurol.*, 1962, 4(1), 35-48.—Electroencephalography and electrocorticography "provide a valuable clinical and neurophysiological approach, but they have not led to the safe and easy detection and extirpation of 'the epileptic focus.' A considerable portion of carefully selected patients . . . may benefit from operation with the aid of neurophysiological methods of investigation. . . . A quantitative factor seems to be involved."—T. E. Newland.

1648. Melin, Karl-Axel. (Stockholm-Farsta, Sweden) **EEG and epilepsy in cerebral palsy.** *Develpm. Med. child Neurol.*, 1962, 4(2), 180-183.—"The incidence of epilepsy in cases of cerebral palsy is variously estimated at 14 to 75 percent—it being much higher in spastic than in choreo-athetoid cases. . . . Serial, as distinct from single, EEG records are of considerable value. . . . Cerebral palsied children who have one or more fits but show repeatedly normal EEGs commonly develop without any further convulsions."—T. E. Newland.

1649. Tikofsky, Ronald S., & Reynolds, Gale L. (U. Michigan) **Preliminary study: Non-verbal learning and aphasia.** *J. speech hear. Res.*, 1962, 5(2), 133-143.—The nonverbal learning behavior of 15 aphasic Ss was compared to 20 nonaphasic Ss on a modification of Grant's Wisconsin Card-Sorting Task, Form XX. The aphasic's learning rate is slower than that of the nonaphasic with perseverative error a major determinant of the lowered rate.—M. F. Palmer.

1650. Wright, George N., Gibbs, Frederic A., & Linde, Shirley Motter. **Total rehabilitation of epileptics: Gateway to employment.** (Washington, D. C.: Office Vocational Rehabilitation, 1962. xv, 207 p. \$1.25.—An edited report of papers and discussions of the 1st national institute on the total rehabilitation of epileptics held May 25-27, 1960 in Chicago. The papers are grouped in 4 chapters: "Toward a Better Understanding," "The World of the Epileptic," "Evaluating the Epileptic and His Disorder," and "Rehabilitation Performance." Appendices include a Table of Antiseizure Drugs, Films on Epilepsy, and a 122-item bibliography.—B. Lowenfeld.

Brain Damage

1651. Angelergues, R., de Ajuriaguerra, J., & Hécaen, H. (Hôpital St. Anne, Paris, France) **La négation de la cécité au cours des lésions cérébrales.** [Denial of blindness in patients with cerebral lesions.] *J. Psychol. norm. pathol.*, 1960, 57(4), 381-404.—The authors reconsider systematically the question of anosognosia of blindness due to pre- and postchiasmic lesions. In addition to those in the earlier literature, 5 new cases are presented in detail.—M. L. Simmel.

1652. Belmont, Ira, & Birch, Herbert G. (Hillside Hosp., Glen Oaks, N. Y.) **"Productivity" and mode of function in the Rorschach responses of brain-damaged patients.** *J. nerv. ment. Dis.*, 1962, 134(5), 456-462.—"When the amount of productivity on the Rorschach test was related to qualitatively different levels of perceptual functioning revealed by Rorschach testing, it was shown that, for brain-damaged patients, using a neurologically normal control group as a standard, low productivity was associated with 1) a high percentage of reported specific and clear perceptions, 2) a small number of defectively analyzed percepts, and 3) a tendency to accept verbally suggested visual perceptions. High productivity was associated with the opposite qualities."—N. H. Pronko.

1653. Benton, Arthur L. (State U. Iowa) **Behavioral indices of brain injury in school children.** *Child Develpm.*, 1962, 33(1), 199-208.—A critical review of the prevailing views concerning brain damage in children suggests some problems. One of the more predominant of which is the tendency for clinicians to think in terms of "the behavioral symptom-complex of the brain damaged child"; a conceptualization which is not consistent with the data. A 2nd problem is the response-response nature of diagnosing brain damage as opposed to a "state of the organism-response" approach.—W. J. Meyer.

1654. Chernova, A. D. **Vosstanovlenie rechi pri zabelevaniiakh golovnogo mozga.** [The restoration of speech in diseases of the brain.] Moscow, USSR: Medgiz, 1958. 119 p.—This book discusses the problems and methods of speech restoration and related functions, summarizing thereby the results of 20 years' work with approximately 400 patients suffering from various forms of aphasia.—I. D. London.

1655. Clawson, A. (Wichita Guidance Center) **Relationship of psychological tests to cerebral disorders in children: A pilot study.** *Psychol. Rep.*, 1962, 10(1), 187-190.—"A battery of 22 tests was administered individually to 10 brain-damaged children, 10 clients of a guidance center, and 10 children chosen by their schools as 'normal.' All children were of average or above intelligence, ages ranged from 8-0 yr. to 13-0 yr., and groups were matched for age and intelligence. Scores on seven tests differentiated among groups or seemed worthy of further study: Wechsler Intelligence Scale for Children, Wide Range Achievement, Draw-A-Man, Wichita Guidance Center Sorting Test, Bender-Gestalt, Right-Left Discrimination, and Finger Localization."—B. J. House.

1656. Jerger, James, & Walker, Jesse. (Auditory Research Lab., VA) **Some observations on masking and on the progression of auditory signs in acoustic neurinoma.** *J. speech hear. Disord.*, 1962, 27(2), 140-143.—A single patient studied over a 2-year period prior to the surgical removal of an acoustic tumor showed a fairly consistent pure-tone audiogram, but the PB score deteriorated substantially and the Bekeasy audiogram changed from Type I to Type III. Attempts to demonstrate anything unusual in the pure-tone masking produced by thermal noise on this ear were unsuccessful.—M. F. Palmer.

1657. Kent, Eric G. (Florida State U.) **Binaural beats: Their perception by individuals with and without organic brain pathology.** *Dissert. Abstr.*, 1961, 21(12), 3854.—Abstract.

1658. Lawson, Ian R. (Woodend General Hosp., Aberdeen, Scotland) **Visual-spatial neglect in lesions of the right cerebral hemisphere.** *Neurology*, 1962, 12, 23-33.—". . . visual-spatial neglect involves an additional incapacity toward visual space, for, whereas the patient with simple hemianopsia is able to use the intact parts of the visual fields to scan to the affected side, the patient with visual-spatial neglect fails to do so. . . . This paper is a report of two patients who suffered from visual-spatial neglect, which materially interfered with their ability to read. Its evidence derives primarily from the endeavor of training them to read correctly again. The attempt met with a partial and selective success, which was found to be conditional, firstly, on the nature and arrangement of the visual material presented to the patient and, secondly, on the extent to which vision, particularly scanning ability, could be reinforced by other sensory channels."—R. Gunter.

1659. Lehtinen, Laura Elizabeth. (Northwestern U.) **Performance of minimally brain-damaged and normal children on a simple discrimination learning task.** *Dissert. Abstr.*, 1961, 21(10), 3166.—*Abstract*.

1660. Neal, Elizabeth. **One of those children.** New York: Taplinger, 1962. 199 p. \$4.50.—A biographical account of a brain-damaged boy with IQ too low for ordinary schooling in Great Britain, and the sensitive reactions of his mother to the problems involved in identification, the daily concerns about safety and about training, the occasional successes she had as tutor and their greater frequency as she became more insightful and skillful, her reactions at abandoning her own ambitions, and how she managed the potentiality of sibling rivalry with the boy's older brother and exploited the situation for personality growth of all the family.—W. L. Wilkins.

1661. Paine, Richmond S. (Harvard Medical School) **Minimal chronic brain syndromes in children.** *Develpm. Med. child Neurol.*, 1962, 4(1), 21-27.—Out of 41 children referred for neurological consultation because of poor school work, clumsiness, poor speech, or emotional problems (none of whom had previous definite diagnosis of neurological abnormality), 31 showed definite abnormal neurological signs, with 9 of the other 10 at least excessively clumsy. "It is suggested that there is a syndrome of minimal brain damage, with subclinical affections" in motor, mental, sensory, and convulsive areas.—T. E. Newland.

1662. Smith, J. Lawton. (Duke U. School Medicine) **Vertical optokinetic nystagmus.** *Neurology*, 1962, 12, 48-52.—"Vertical and horizontal optokinetic responses have been routinely investigated in a series of over 300 patients seen in neuro-ophthalmologic consultation in Duke Hospital between July 1960 and June 1961. From this clinical material, 6 abnormal types of vertical optokinetic responses have been thus far recognized and are here reported with comments on their value in neuro-ophthalmologic diagnosis. . . . Pathways involved in optokinetic nystagmus in general await clarification, and clinical anatomic correlation is needed in this field. This is even more the case with regard to the vertical optokinetic responses, which have attracted little attention."—R. Gunter.

1663. Teuber, Hans-Lukas, & Rudel, Rita G. (Massachusetts Inst. Technology) **Behavior after**

cerebral lesions in children and adults. *Develpm. Med. child Neurol.*, 1962, 4(1), 3-20.—"Animal experiments tend to show that brain injuries sustained early in life have less effect than comparable lesions incurred at later stages. By contrast, neurological observations suggest that certain forms of early brain damage in children may have disproportionately serious consequences for later development. The apparent contradiction may be resolved if one grants that results might differ, according to (a) the kind of task employed, and (b) the age at which the child is tested. Three perceptual tasks have been devised which disclose such differential effects." Responses were obtained from 232 brain-wounded males, a control group of men, and a group of brain-injured children (the latter over a period of 10 years). "On one task [determining auditory midline], the effects of early injury are not apparent before the age of 11 years, but become increasingly obvious thereafter. On the second [determining the starting point of an auditory stimuli], a deficit is manifest at all ages. The third [self-righting] reveals effects of early injury only up to the age of 11 years; no abnormality can be discovered after this age." (28-item bibliogr.)—T. E. Newland.

1664. Vaughan, Herbert G., & Costa, Louis D. (Albert Einstein Coll. Medicine, Bronx, N. Y.) **Performance of patients with lateralized cerebral lesions. II: Sensory and motor tests.** *J. nerv. ment. Dis.*, 1962, 134(3), 237-243.—"Thirty-five Ss with lateralized cerebral lesions (17 with left-sided lesions, 18 with right-sided), and 18 controls, were given four tests of somesthetic and motor function: pressure threshold, two-point discrimination, finger oscillation and Purdue Peg Board. The 18 Ss with right cerebral lesions, both individually and as a group, demonstrated significantly greater impairment of function than did Ss with left cerebral lesions. The group with right cerebral lesions also appeared to contain more Ss with severe and extensive lesions (on the basis of EEG data)."—N. H. Pronko.

1665. Weinstein, Edwin A., & Kahn, Robert L. **Patterns of sexual behavior following brain injury.** *Psychiatry*, 1961, 24(1), 69-78.—36 of 196 patients with intracranial lesions showed changes in sexual behavior which are described, related to the pre-morbid personality and to other behavioral alterations, and exemplified by one detailed case report.—C. T. Bever.

Cerebral Palsy

1666. Barsch, Ray H., & Rudell, Beth. (Jewish Vocational Service, Milwaukee, Wis.) **A study of reading development among 77 children with cerebral palsy.** *Cerebral Palsy Rev.*, 1962, 23(2), 3-12.—The reading behavior of all 1958-59 clinic patients, aged 5-16, was evaluated by a specialist in reading with respect to 10 facets of reading: 58 were judged to have intelligible speech, 6% were advanced in reading development, and 69% were retarded. Clinical impressions of intellectual level were directly related to reading development. The frequency of good and poor readers was similar for both regular and orthopedic school children. The hemiplegic cases were the best readers.—T. E. Newland.

1667. Bortner, Morton, & Birch, Herbert G. (New York Medical Coll.) **Perceptual and perceptual-motor dissociation in cerebral palsied children.** *J. nerv.*

ment. *Dis.*, 1962, 134(2), 103-108.—"The block-design subtest of the WISC was administered to 28 cerebral palsied children. After an initial procedure in which S's inability to reproduce certain designs was recorded, he was asked to choose from three actual block models the one which looked exactly like the design on the card. Among the 28 patients there were 89 failures in block design reproduction. When offered the opportunity to match the design on the card with the one of three actual block models which was accurate copy, Ss were able to choose correctly 79 per cent of the time. Implications are drawn from these results for a concept of the levels of perceptual organization."—N. H. Pronko.

1668. Gibbs, Norah. (London, England) **Organization of diagnostic and treatment clinics for cerebral palsied children.** *Cerebral Palsy Bull. Suppl.*, 1961, No. 4. 8 p.—The philosophy, staffing, and functioning of such clinics are delineated in condensed form by a subcommittee of the Medical Advisory Committee of the National Spastics Society.—T. E. Newland.

1669. Hickey, Kathleen. **Reading ability of cerebral palsied children.** *Develpm. Med. child Neurol.*, 1962, 4(2), 209-210.—The reading behaviors of 60 children, aged 4½-16½ years were reported by their teachers. 19 were reported to be "fluent readers"; 23 "able to read." Many were "late starters," sometimes being 10 or 11 years old before making a beginning. "Low mental ability was a grave problem." Teachers' experiences are reported.—T. E. Newland.

1670. Irwin, Orvis C. **Repetition of an investigation of diphthong articulation by children with cerebral palsy.** *Cerebral Palsy Rev.*, 1961, 22(6), 12-13.—The responses of 320 children later tested showed no statistically significant differences from those in the prior sample of 166 children.—T. E. Newland.

1671. Irwin, Orvis C. (U. Wichita) **Two notes concerning vowel articulation by children with cerebral palsy.** *Cerebral Palsy Rev.*, 1961, 22(6), 11, 12, 14.—148 cerebral palsied children did "equally well in articulating vowel sounds in single and double syllable words." Interform reliability of a test of vowel articulation was found to be .85; test-retest reliability, after 21 days was .64. Test-retest reliability of a test of consonant pronunciation, after 21 days was .85.—T. E. Newland.

1672. Irwin, Orvis C. (U. Wichita) **A second comparative study of articulation of children with cerebral palsy and of mentally retarded children.** *Cerebral Palsy Rev.*, 1962, 23(1), 17-19.—The responses on an articulation test of 162 mentally retarded children were compared with those of 265 children with cerebral palsy. The children were from 3 to 16 years old. It was found that "cerebral palsy" as such was a factor in addition to the mental retardation in the speech of the cerebral palsied children, and that omissions significantly exceeded substitutions in both groups.—T. E. Newland.

1673. Irwin, Orvis C. (U. Wichita) **Status of articulation of final reversed consonant blends by children with cerebral palsy.** *Cerebral Palsy Rev.*, 1962, 23(2), 17-19.—Tape recorded pronunciations by 273 children were analyzed. Geographic, regional, and sex differences were not present; low correlations

were found between CA, MA, and IQ; no significant differences existed between spastics and athetoids; correct articulation exceeded both substitution and omission errors; and omissions exceeded substitutions.—T. E. Newland.

1674. James, F. E. (National Childrens' Home, Penhurst, Oxford) **Olfactory sensation in cerebral palsy.** *Develpm. Med. child Neurol.*, 1962, 4(2), 1962.—There was no specific loss of olfactory sensation in a group of cerebral palsied children who were paired with non-cerebral palsied physically handicapped children. No relationship was observed related to Terman-Merrill IQs.—T. E. Newland.

1675. Lenard, H. M. (Milwaukee, Wis.) **Vocational implications for the cerebral palsied.** *Cerebral Palsy Rev.*, 1962, 23(2), 13-16.—17 young people, aged 14-18, participating in a special half-day work experience program run by the United Cerebral Palsied Work Evaluation and Classification Project, were provided vocational counseling. The vocational expectations of the parents, who did not participate directly in the counseling, and of the youngsters shifted from "very high" to "average," greater shift occurring in the cases of parents in the upper financial and educational group. Pre- and postcounseling occupational choices, for both parents and worker-clients, were within the field of the father or of the working mother.—T. E. Newland.

1676. Schiller, Edgar J. (Cerebral Palsy Ass. Western New York, Buffalo) **Creative habilitation of the cerebral-palsied child.** *J. Rehabil.*, 1961, 27(6), 14-15, 39, 42.—A descriptive article on the outcomes from a parental program of creative problem-solving. These "brain-storming sessions" appear to have been effective, with many useful contributions to the resolution of difficult and previously insoluble problems. Some case studies are included.—M. A. Seidenfeld.

1677. Simar, A. (Brussels, Belgium) **About the reeducation of cerebral palsy.** *Cerebral Palsy Rev.*, 1961, 22(6), 7-9.—Data are presented showing changes, after 1 to 5 years' re-education, in 27 children with respect to locomotion, self care, speech, intelligence, and education. The progress realized was "not necessarily connected with" intelligence; was more rapid in the early stages of treatment; was better for children identified early; and was greatest for hemiplegics, followed by spastics, and least for athetoids. Parents should not be expected to expect too much.—T. E. Newland.

MENTAL RETARDATION

1678. Baum, Marian H. (Lorain County Child Welfare Board, Elyria, O.) **Some dynamic factors affecting family adjustment to the handicapped child.** *Except. Children*, 1962, 28, 387-392.—The various types of parents' reactions to their handicapped child are discussed. It is concluded that "the practical purpose of any attempted dynamic formulation of parental reactions to the awareness of global defect in their child is to provide insight into behavior that enables the professional advisor to help these parents 'see the child as a separate human being, and his handicap as an unfortunate accident of nature.' . . . The parent must be assisted, through the repetitive working through of feelings to reach the final stage of mourning, wherein his behavior is

reorganized and directed toward a new object—the handicapped child as he is, in realistic terms.”—J. Z. Elias.

1679. Beck, Helen L. (St. Christopher's Hosp. for Children) **The advantages of a multi-purpose clinic for the mentally retarded.** *Amer. J. ment. Defic.*, 1962, 66(5), 789-794.—The problem of integrating services for the mentally retarded is described. Gaps in services and duplication of services are discussed. 2 attempts to find more effective approaches to services for the retarded and to modify the problems created by too much or the wrong kind of specialization are considered. The role of the community and the use of its resources are emphasized.—V. Staudt-Sexton.

1680. Benton, A. L., & McGavren, Musettes. (Woodward State Hosp.) **Qualitative aspects of visual memory test performance in mental defectives.** *Amer. J. ment. Defic.*, 1962, 66(6), 878-883.—The purpose of this study was to determine whether the reproduction of visual designs from memory differs qualitatively for normals and defectives, when over-all performance is controlled. 36 normal and 36 mental defectives were matched and paired for total error score on their Visual Retention Test, Form C performances. When the performances of the 2 groups were compared in terms of 6 major types of errors (omissions, distortions, perseverations, rotations, misplacements, size) it was found that they differed in only 1 respect—the defective made many more size errors than did the normal children.—V. Staudt-Sexton.

1681. Berkson, G., & Davenport, R. K. (Yerkes Lab. Primate Biology) **Stereotyped movements of mental defectives: I. Initial Survey.** *Amer. J. ment. Defic.*, 1962, 66(6), 849-852.—71 severely retarded patients were observed in their cottages for brief periods. $\frac{2}{3}$ of them exhibited stereotyped movements and postures. The observations were reliable but depended on the behavior category. The stereotyped behaviors were related significantly to self manipulation, IQ, age, and length of institutionalization. More stereotyped behaviors were observed in the blind than in the sighted Ss.—V. Staudt-Sexton.

1682. Cantor, G. N., & Ryan, T. J. (Iowa Child Welfare Research Station) **Retention of verbal paired-associates in normals and retardates.** *Amer. J. ment. Defic.*, 1962, 66(6), 861-865.—20 educable retardates and 24 kindergarten or 1st grade normals, matched roughly for MA level were given a paired-associates verbal learning task. $\frac{1}{2}$ of each intelligence group was returned for relearning 1 week later. The other $\frac{1}{2}$ were required to relearn 1 month later. An analysis of trials-to-criterion scores indicated that: (a) there was no significant difference between the groups in acquisition; (b) the normals and retardates failed to differ significantly in amount retained following both the 1-week, and 1-month intervals; and (c) retention after 1 week did not differ from that occurring after 1 month. Analysis of the savings scores confirmed retention findings.—V. Staudt-Sexton.

1683. Daly, W. & Huber, W. (Orient State Inst. Orient, O.) **A note on "Sexual Identification in Mentally Subnormal Females" by Fisher.** *Amer. J. ment. Defic.*, 1962, 66(5), 782-783.—V. Staudt-Sexton.

1684. Davis, D. Russell. (Cambridge U.) **A disorder theory of mental retardation.** *J. ment. Subnorm.*, 1961, 7(1, Whole No. 12), 13-21.—A stress theory of mental retardation is suggested in which impairment in learning capacity is attributed to psychological stresses arising out of disturbed parent-child relations. Evidence from comparative psychology, especially Liddell's work, is adduced in support of this position. Additional observations from the clinical literature are noted with regard to the possible emotional origin of retardation.—A. Barclay.

1685. Dentler, Robert A., & Mackler, Bernard. (Dartmouth Coll.) **The socialization of retarded children in an institution.** *J. Hlth. hum. Behav.*, 1961, 2(4), 243-252.—The goal was to study institutional socialization of educable retarded children while the children lived in a cottage. The Ss were 29 boys newly admitted to a state school. Their ages were 6-12 with a mean IQ of 56. Observation and sociometric tests were used. A basic premise was that the function of the institutional socialization process is to reorganize the self of the newcomer. While the character of the institution studied proved incompatible with individuality, it was compatible with efficient management and rehabilitation toward limited participation and adult subsistence in the community upon discharge.—L. A. Ostlund.

1686. DeProspero, Chris, Joseph. (New York U.) **An administrative handbook for the bureau for children with retarded mental development of the New York city public schools.** *Dissert. Abstr.*, 1961, 21(10), 3158.—Abstract.

1687. Dittmann, Laura L. (United States Children's Bureau, Dept Health, Education & Welfare) **The family of the child in an institution.** *Amer. J. ment. defic.*, 1962, 66(5), 759-765.—Some of the inhibiting factors which seem to be present in the family and in the institution when a child is placed in a residential institution are discussed. Close contact of parents with the institution is needed.—V. Staudt-Sexton.

1688. Earl, Charles James Cecil. **Subnormal personalities: Their clinical investigation and assessment.** Baltimore, Md.: Williams & Wilkins, 1961. xiv, 338 p. \$7.00.—This posthumous work of the author was completed by H. C. Gunzburg. It is based almost entirely on their work at Monyhull Hospital, Birmingham, and particularly on their experience with educationally subnormal boys. The book shows how a mental testing battery can be built up that will give much better information about children, both in quantity and in reliability, than a "straight IQ." It describes the development of Earl's Moron Battery, together with a codification of somatotype examination techniques and a standardization of social diagnostic procedures. The author adopted a descriptive, ideographic approach to describe aspects of personality of the subnormal: weakness, simplicity, immaturity, instability, schizoidia, viscosity, neurosis, psychopathy, and psychosis. Other chapters discuss subnormal language and the treatment and training of adult subnormals.—V. Sanua.

1689. Fisher, G. M. (Fairview State Hosp., Costa Mesa, Calif.) **A note on "Sexual Identification in Mentally Subnormal Females" by Fisher: Reply to Daly and Huber.** *Amer. J. ment. Defic.*, 1962, 66(5), 784.—V. Staudt-Sexton.

1690. Franks, V., & Franks, C. M. Classical conditioning procedures as an index of vocational adjustment among mental defectives. *Percept. mot. Skills*, 1962, 14, 241-242.—3 groups of female mental defectives of different degrees of work adjustment were compared. The prediction was confirmed that those defectives whose vocational adjustments were poor were also those who were relatively poor at forming conditioned eyeblink responses in the laboratory. The groups did not differ significantly with respect to age, sex, IQ, indices of physical health, or proportion of Ss with apparent CNS damage.—W. H. Guertin.
1691. Gallagher, J. J. (Inst. for Research on Exceptional Children, U. Illinois) Changes in verbal and non-verbal ability of brain-injured mentally retarded children following removal of special stimulation. *Amer. J. ment. Defic.*, 1962, 66(5), 774-781.—Examined the effect of removing special tutoring procedures from a group of institutionalized mentally retarded brain-injured children who had undergone tutoring for a period of from 1 to 2 years. The author suggests that the professional worker can take a position of cautious optimism regarding the possibility of small to modest gains in ability in some retarded children under conditions of special stimulation. These gains are not necessarily lost when the stimulation is removed.—V. Staudt-Sexton.
1692. Graliker, Betty V., Fishler, Karol, & Koch, R. (Los Angeles Childrens Hosp.) Teenage reaction to a mentally retarded sibling. *Amer. J. ment. Defic.*, 1962, 66(6), 838-843.—Interviews were held with 21 teenage siblings of a group of 16 retarded children. The aim was to find out what it meant to the teenager in terms of his school, social, and family life, to have a retarded brother or sister. The interview covered 4 areas: description of the teenager, relationships in the home, attitudes toward the mentally retarded siblings, and attitudes towards institutionalization of the retarded sibling. The results indicated that the teenagers, on the whole, lead a normal life with adequate social outlets and positive relationships with their peers; their relationships within the home structure were good; and there was acceptance of the retarded child and adequate understanding of the diagnosis. It was suggested that the presence of a young retarded child in the home does not seem to have an adverse effect upon teenage siblings, particularly when early diagnosis and parent guidance by a multidisciplinary team composed of a pediatrician, psychologist, public health nurse, and social worker help the family to maintain its equilibrium.—V. Staudt-Sexton.
1693. Hunt, Betty M. (Columbus State School, O.) Differential responses of mentally retarded children on the Leiter Scale. *Except. Child.*, 1961, 28, 99-102.—3 groups, of 30 children each, were matched with respect to MA, CA, and Binet IQ. Group 1 was diagnosed as familial; Group 2 as brain-injured with no medically recognized loss of visual acuity but handicapped in visual-motor activities, tasks of visual discrimination, and/or responding to 2-dimensional material; Group 3 as brain-injured with minimum handicaps in above areas. Differences of means on the Leiter between pairs of the above groups showed a significant difference only between the 2nd and 3rd groups in favor of the latter ($t = 2.20$, $P < .05$).—J. Z. Elias.
1694. Itard, Jean-Marc Gaspard. The wild boy of Aveyron. New York: Appleton-Century-Crofts, 1962. xxiv, 104 p. \$1.35. (paper).—A paper-bound issue of this well-known classical 18th Century clinical study of a wild boy discovered in Aveyron, France and of Itard's attempts to stimulate his social adaptation and his intellectual development. This translation by George and Muriel Humphrey is from the reprinted edition of 1894 of *Rapports et Memoires sur le Sauvage de L'Aveyron*, Paris, which is out of print.—M. A. Seidenfeld.
1695. Kumae, Tsukihar. The meaning of indeterminate number words in feeble-minded children. *Jap. J. Psychol.*, 1962, 32, 347-352.—A discussion of the use of concepts of very many, many, few, and very few in feeble-minded children. The children understood the words correctly but did not understand the sequence of number progression from very many to very few.—A. Barclay.
1696. Lenhoff, F. G. Exceptional children. New York: Taplinger, 1962. 201 p. \$4.95.—An American edition of the 1960 publication of Allen & Unwin, London.—J. W. Thompson.
1697. Olshansky, S., Schonfield, J., & Sternfeld, L. (Children's Developmental Clinic, Cambridge, Mass.) Mentally retarded or culturally different? *Train. Sch. Bull.*, 1962, 59, 18-21.—The authors urge the abandonment of the term "mental retardation" which is used currently by professionals to categorize children without brain damage in (contrast to the term "mental deficiency," which applies to children with known brain damage). They believe that children without brain damage are more aptly described at this time as "culturally different" rather than mentally retarded.—V. S. Sexton.
1698. Orme, J. E. The Coloured Progressive Matrices as a measure of intellectual subnormality. *Brit. J. med. Psychol.*, 1961, 34, 291-292.—"Coloured Progressive Matrices scores and W.A.I.S. full-scale I.Q.'s were obtained from 203 mentally subnormal subjects, aged 16-65, within the 40-80 I.Q. range." Correlations for age groups vary from .72 to .98.—C. L. Winder.
1699. Penney, R. K., Croskery, J., & Allen, G. (U. Texas) Effects of training schedules on rigidity as manifested by normal and mentally retarded children. *Psychol. Rep.*, 1962, 10(1), 243-249.—24 normal and 24 retarded children, matched for MA, received 20 presentations of a single stimulus to which they were instructed to press a bar. Half of each group was rewarded on each presentation and the rest on only 50% of the trials. The training stimulus then became the negative cue of a discrimination problem. All Ss performed at chance on the 20 trials of the discrimination problem except for normal Ss following 100% reward, who achieved 75% correct. The authors discuss rigidity as a possible explanation.—B. J. House.
1700. Perry, Thomas L. (Inst. Technology, Pasadena) Urinary excretion of amines in phenylketonuria and mongolism. *Science*, 1962, 136 (3519), 879-880.—Children with phenylketonuria excrete considerably less serotonin and tryptamine and somewhat less normetanephrine and p-tyramine than normal children. The excretion of these amines was not decreased in mongolism. Even during monoamine oxidase blockade, o-tyramine could not be

detected in the urine of phenylketonurics. These findings are discussed in relation to the mental defect of phenylketonuria.—*Journal abstract.*

1701. Pilkington, T. L. (Cranage Hall Hosp., Cheshire, England) **A note on a film experiment in recording mental defectives.** *Amer. J. ment. Defic.*, 1962, 66(5), 733-735.—Film records of mentally defective patients were made while they were undergoing a clinical trial of a thymoleptic drug. It was suggested that the use of ciné-recording of psychiatric patients, not only to show their responses to therapy, but to show their "natural" development over periods of time, is worthy of further exploration with particular reference to its objectivity.—*V. Staudt-Sexton.*

1702. Pryer, Margaret W., & Cassel, R. H. (State Colony & Training School, Pineville, La.) **The Children's Manifest Anxiety Scale: Reliability with aments.** *Amer. J. ment. Defic.*, 1962, 66(6), 860.—The reliability data indicate that attempting to separate high and low anxiety groups of retarded Ss (MA < 8) by means of the CMAS may be impractical. The necessary large score-range between the 2 groups excludes too many Ss. The test-retest reliability coefficients, while not high by mental test standards, are not too low to preclude the use of the CMAS with retarded Ss of low MA in designs in which the anxiety score is the dependent variable.—*V. Staudt-Sexton.*

1703. Rigrodsky, S. (Training School, Vineland, N. J.) **Procedures for speech therapy with institutionalized mentally retarded children.** *Train. Sch. Bull.*, 1962, 59(1), 3-8.—This review demonstrates the need for effective speech and language therapies for the mentally retarded. Difficulties in all areas of languages are confounded by sensory and perceptual deficits. Programs must maintain elasticity, from offering stimulation for the nonverbal to providing techniques for children with unique language handicaps.—*V. S. Sexton.*

1704. Rohrs, F. W., & Haworth, Mary R. (Michigan State U.) **The 1960 Stanford-Binet, WISC, and Goodenough Tests with mentally retarded children.** *Amer. J. ment. Defic.*, 1962, 66(6), 853-859.—Correlations and significant mean differences between the new Stanford-Binet, L-M, the WISC, and the Goodenough Draw-A-Man Test are reported. 2 groups of mentally retarded children served as Ss, one of familial etiology (N = 20) and the other of various organic etiologies (N = 26). Test differences between the 2 groups were also examined including analyses of SB, L-M scatter, and the differentiating ability of individual SB, L-M items. The most outstanding result for the group as a whole was the significantly higher mean score on the S-B, L-M than on the WISC Full Scale. This finding is contrary to most earlier studies which compared the 1937 revision of the Stanford-Binet with the WISC. The combined groups also scored significantly higher on the DAM than on the WISC Full Scale. S-B, L-M correlated more highly with the WISC Full and Verbal Scales than with the Performance Scale, while the DAM correlated highest with the WISC Performance Scale.—*V. Staudt-Sexton.*

1705. Rosenberg, S., Spradlin, J., & Mabel, S. (U. Kansas) **Interaction among retarded children as a function of their relative language skills.** *J.*

abnorm. soc. Psychol., 1961, 63(2), 402-410.—It has long been recognized that the quality of interpersonal relations affects the behavior of individuals with mental retardation. The question to be assessed here was the effect of the skill of individual reacting with the mental retardate upon the behavior of the retardate. This study is a modified replication of an earlier one (Rosenberg, 1959). Ss of an institution for mental retardates were categorized re: verbal facility. Group of Ss was then formed containing pairs of Highs and Lows on this test, and interpersonal behavior was assessed in a play room situation. The results indicate that Lows and Highs interact with each other effectively, whereas heterogeneity of grouping inhibits social interaction.—*G. Frank.*

1706. Ross, R. T. (California State Dept. Mental Hygiene) **The mental growth of mongoloid defectives.** *Amer. J. ment. Defic.*, 1962, 66(5), 736-738.—A mental growth curve for mongoloid defectives was derived by averaging for each year of chronological age, the corresponding mental ages from among 520 tests on 319 mongoloid patients examined by either the Stanford-Binet, Wechsler, Kuhlmann, or Cattell scales. The conclusion drawn was that the curve of mental growth for mongoloid defectives is essentially of the same shape as that determined for normal Ss and about 25% as high at each chronological age.—*V. Staudt-Sexton.*

1707. Sheridan, Mary D. (English Ministry Health) **Mentally handicapped children.** *Dev. elpm. Med. child Neurol.*, 1962, 4(1), 71-76.—"Present arrangements in England for the day care and training of mentally handicapped children under 8 years, who are not considered suitable for education at school, are briefly described."—*T. E. Newland.*

1708. Shipe, Dorothy; Dingman, H. F., Windle, C., & Moticha, Katherine. (Pacific State Hosp., Pomona, Calif.) **Validity of a measure of escape proneness.** *Amer. J. ment. Defic.*, 1962, 66(6), 872-877.—195 mildly retarded patients at Pacific State Hospital were given a 9 item Escape-Proneness Scale, a modification of Clark's AWOL Recidivist Scale. Neither the entire scale nor any individual item differentiated between patients who had engaged in acting-out behavior and those who had not.—*V. Staudt-Sexton.*

1709. Stevenson, H. W., & Knights, R. M. (U. Minnesota) **Social reinforcement with normal and retarded children as a function of pretraining, sex of E, and sex of S.** *Amer. J. ment. Defic.*, 1962, 66(6), 866-871.—Normal and retarded Ss of approximately the same MA were given a simple performance task in which responses were reinforced by supportive comments delivered by E. $\frac{1}{2}$ of the boys and girls were tested by a male E and the other $\frac{1}{2}$ by a female E. $\frac{1}{2}$ of the Ss played 3 pretraining games in which 10 out of every 12 responses were deemed correct by E. The remaining Ss received no pretraining. The results showed a significant difference in performance between the pretraining and no-training groups. A significant interaction between type of S and pretraining condition was also found. A greater difference in performance between the 2 conditions occurred in normal Ss than in retarded Ss. Evidence for a crosseffect was found in which Es influenced the behavior of Ss of the opposite sex to a greater degree than Ss of the same sex. Pretraining decreased the cross-sex differences.—*V. Staudt-Sexton.*

1710. Thresher, Janice M. (Walter E. Fernald State School) A problem for educators: Arithmetical concept formation in the mentally retarded child. *Amer. J. ment. Defic.*, 1962, 66(5), 766-773.—Conflicting opinions are reported concerning the capabilities of retarded children, an appropriate arithmetic curriculum for them, and the methods and materials for teaching it. Arithmetical concept formation (a problem for many mentally retarded children) is described as involving the following developmental process: (a) concrete object observation, (b) picture perception and recognition, (c) abstract conceptualization, (d) symbolic interpretation, and (e) utilization and application of arithmetical procedures.—V. Staudt-Sexton.

1711. Wallin, J. E. W. Survey of educational attainments of clients in Industries Limited: A workshop for mental retardates. Carlisle, Pa.: Industries Limited, 1962. 39 p. \$.25.—Results are presented for reading, arithmetic, spelling, written language skills, Wallin-Cutsforth Tests, and certain other performance tests.—C. T. Morgan.

1712. White, Delilah T. (Cook County Hosp., Chicago 1, Ill.) The advantages of a special clinic for the mentally retarded. *Amer. J. ment. Defic.*, 1962, 66(5), 785-788.—The special clinic is described as permitting carefully focused, long-term observation of the patient which leads to more accurate and comprehensive diagnosis. The number and variety of cases seen allows for more authoritative and varied research. The knowledgeable staff is well suited for teaching other professional workers and the lay public. Parents in the special clinic discover a reassuring atmosphere where they can receive pertinent information and emotional support. Lastly, the agency by limiting its concern to the single problem of retardation is best able to establish a constant, sensitive rapport with other services, such as schools and other clinics, dealing with similar problems.—V. Staudt-Sexton.

1713. Windle, C. (Pacific State Hosp., Pomona, Calif.) Prognosis of mental subnormals. *Amer. J. ment. Defic.*, 1962, 66(5, Monogr. Suppl.), 180 p.—Presents a compilation of research results, data, and ideas on prognosis in mental subnormality. The 10 chapters include discussions of the characteristics of institutionalized subnormals, methodology problems of prognostic studies, intensive literature reviews on demographic characteristics, patient abilities and disabilities, institutional experiences, and family and community factors. An extensive bibliography is appended.—V. S. Sexton.

1714. Woodward, Mary. (University Coll., Swansea) Concepts of number of the mentally subnormal studied by Piaget's method. *J. child Psychol. Psychiat.*, 1961, 2(4), 249-259.—A replication of 4 of Piaget's experiments with 50 adults around 19 years (IQ 44-73) and 44 children around 13 years old (IQ 25-55). Responses were similar to those of normal children 4-7 years with most Ss performing at the intuitive or concrete operational levels. Few Ss performed at the same level on all 4 tasks. A relatively advanced level was found for problems involving a one-to-one correspondence between 2 sets of objects but problems involving series and part-whole relations were handled intuitively.—J. M. Reisman.

1715. Woodward, Mary. (Fountain Hosp., London) Concepts of space in the mentally subnormal studied by Piaget's method. *Brit. J. soc. clin. Psychol.*, 1962, 1(1), 25-37.—3 experiments, devised by Piaget and Inhelder for use with normal children, were used to study the concepts of space in 94 mentally subnormal adults or children. Although there was little consistency as regards stages, the types of response and sequences reported obtaining in normal children were also found to apply in the present groups.—C. M. Franks.

BEHAVIOR PROBLEMS

1716. Hollister, William G., & Goldston, Stephen E. (National Inst. Mental Health, Bethesda, Md.) Psychoeducational processes in classes for emotionally handicapped children. *Except. Children*, 1962, 28, 351-356.—Based upon an analysis of program descriptions from schools located in various sections of the country, a classification is offered of the processes involved which are grouped under the major headings: administration, pupil selection and study, classroom operations, and supportive operations. "We have developed this beginning effort at a taxonomy of the methods used in these classes in the hope that this preliminary outline will be of value to those currently planning and operating programs, and to those attempting to describe and evaluate the procedures being used in these classes."—J. Z. Elias.

1717. Kolariková O. (Dětská psychologická poradna, Brno) Psychologické typy toulavosti u dětí. [Psychological types of vagrancy of difficult children.] *Ceskoslov. Psychol.*, 1961, 5, 234-250.—Analysis of vagrancy of 104 children aged 8-14 years (86 boys, 18 girls). Author differentiated cases of vagrancy based on spontaneous activity, on reactive action or on combination of both. Unfavorable family background was ascertained in an absolute majority of cases. There are 4 categories identified: defectiveness, variability, educative insufficiency, and educative indisposition of the parents. The motivation toward vagrancy is to be found in social, personal, or situational influences. Psychoprophylactic and reeducative treatments are described. (Russian & English summaries)—V. Břicháček.

1718. Moreno de Taubenslag, H., & Costa, E. Problemas de conducta y lesión cerebral mínima. [Behavioral problems and minimal cerebral lesions.] *Acta neuropsiquiat. Argent.*, 1961, 7(3), 193-195.—A high percentage of children with behavioral problems reveals an organic basis upon examination. Because of the difficulty of diagnosis, the symptomatology is presented with particular attention to psychomotor and perceptive factors.—W. W. Meissner.

1719. O'Neal, Patricia; Robins, Lee N., King, Lucy Jane, & Schaefer, Jeanette. (Washington U. School Medicine, St. Louis) Parental deviance and the genesis of sociopathic personality. *Amer. J. Psychiat.*, 1962, 118, 1114-1124.—"A 30-year follow-up study of 524 patients originally seen in a child guidance clinic yielded a high proportion (20%) of former patients who met criteria for a diagnosis of sociopathic personality as adults, as compared with a control group (2%). The 84 male patients with this diagnosis are compared, with respect to their parents' behavior problems, to male patients with other psychiatric diseases (166), and to male patients

diagnosed as having no disease (75).”—N. H. Pronko.

1720. Phillips, Richard H. (State U., New York Upstate Medical Center) **The accumulator.** *Arch. gen. Psychiat.*, 1962, 6(6), 474-477.—Contrary to the collector the accumulator has no design in the things he keeps, hides them in shame, gets no pleasure from them, does not define himself through them, and does not express any symbolic meaning with them. Wholesale disposal of the objects is usually an indication of “characterological changes in the direction of clearer self-definition and of better adaptation.”—L. W. Brandt.

1721. Yehilevich, David. **Al mahut hamazochizm, hasadizm vехаotosadizm.** [On the nature of masochism, sadism and autosadism.] *Ofakim*, 1961, 15, 94-105.—“The aim of our paper is to analyze the characteristic features of masochism, sadism, and autosadism by presentation of some theories recognized in psychological writings.” Exogenic, feminine, moral as well as primary and secondary masochism are described, and masochism is explained from the point of view of a defence mechanism of the ego as well as a result of philogenetic and ontogenetic development. The meaning of sadism as well as its biological and psychological sources are given. Remarks about therapy of masochism are included.—H. Ormian.

Alcoholism

1722. Connor, Ralph Gordon. (U. Washington) **The self-concepts of alcoholics.** *Dissert. Abstr.*, 21(12), 3871.—Abstract.

1723. Fort, Twila, & Porterfield, Austin L. (Wrage Round.) **Some backgrounds and types of alcoholic among women.** *J. Hlth. hum. Behav.*, 1961, 2(4), 283-292.—Questionnaires and interviews, with 34 women members of Alcoholics Anonymous provided data concerning the development of alcoholism. The findings were: (a) the time for the development of the entire alcoholic process appears to be considerably shorter in women than in men, (b) the phases of the process appear to be less distinct in female alcoholics than in male alcoholics, (c) only a small proportion of the women seem to develop their alcoholism in the absence of personality difficulties or strong emotional stresses, and (d) the onset of alcoholism seems to be a consequence of a highly emotional event.—L. A. Ostlund.

1724. Palola, Ernest G., Jackson, Joan K., & Kelleher, Daniel. (U. Washington School Medicine) **Defensiveness in alcoholics: Measures based on the Minnesota Multiphasic Personality Inventory.** *J. Hlth. hum. Behav.*, 1961, 2(3), 185-189.—The MMPI was used to measure defensiveness among active and inactive alcoholics. The Ss were 123 present and past alcoholics. The results indicated that the Alcoholics Anonymous members had relatively higher self-protective feelings, i.e., they accepted the problem of alcoholism and suicidal behavior, but were unwilling to admit any unhappiness with their lot in life.—L. A. Ostlund.

1725. Vogel, Muriel D. (Alcoholism Research Found., Toronto) **GSR conditioning and personality factors in alcoholics and normals.** *J. abnorm. soc. Psychol.*, 1961, 63(2), 417-421.—Alcoholic and nonalcoholic introverted and extroverted Ss were placed in a GSR conditioning situation. Significant

differences in conditionability were not found between alcoholics and the nonalcoholic group with regard to the intro-extroversion dimension. The results were seen as confirming aspects of Eysenck's (1957) theory of personality.—G. Frank.

Sex Deviation

1726. Frey, Egon C. **Dreams of male homosexuals and the attitude of society.** *J. indiv. Psychol.*, 1962, 18(1), 26-34.—Anxiety is often the result of social discrimination of homosexuals. We must differentiate between the socially harmless (androphile) homosexual and the criminal, thus helping the former to become a useful community member.—A. R. Howard.

1727. Goldhirsh, M. I. (State Correctional Inst., Grateford, Pa.) **Manifest content of dreams of convicted sex offenders.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 643-645.—The dreams of convicted institutionalized sex offenders were analyzed to see if they contained high sexual content and “uncamouflaged unlawful sex activity.” Dreams of sex criminals and non-sex-crime-offenders in therapy supported the hypothesis.—G. Frank.

1728. Robinson, Marie N. **The power of sexual surrender.** New York: New American Library World Literature, 1962. viii, 192 p.—A paperback edition of the 1959 publication. This is a popular presentation of what medical science knows about frigidity in the human female.—E. Y. Beeman.

Drug Addiction

1729. Tramer, L., & Bentovim, L. **Clinical psychological study on eastern drug addicts.** *Conf. psychiat.*, Basel, 1961, 4(3-4), 194-213.—61 drug addicts in an Israeli mental hospital were divided into 3 groups according to anxiety level and frustration tolerance. Methods of treatment appropriate for each group are described.—E. W. Eng.

Suicide (& Homicide)

1730. Firth, Raymond. **Suicide and risk-taking in Tikopia society.** *Psychiatry*, 1961, 24(1), 1-17.—Suicidal methods and types of suicidal situations in this Western Pacific Polynesian community are described and discussed. Incidence cannot be directly correlated with any other single feature of this society; it reflects the promptness and efficiency of rescue efforts. The manner and occurrence of suicide are socially determined and must be understood in the context of other social acts of the individual and of other members of his society.—C. T. Bever.

1731. Gaultier, M., Fournier, E., & Gorceix, A. **A propos de 47 cas de tentatives de suicides chez des adolescents.** [A study of 47 cases of attempted suicide in adolescence.] *Hyg. ment.*, 1961, 50(6), 363-369.—Conclusions: (a) women predominate (40 out of 47); (b) previous attempts, several months or years prior to the current one, are frequent; (c) major maladjustment is rare (1 psychotic out of 47); (d) when the attempt corresponds to an emotional crisis, the suicide is an attempted solution to the problem; (e) the conflicts persist after the attempt, so that prolonged surveillance is called for.—W. W. Meissner.

1732. Meerloo, Joost A. M. **Suicide and mass suicide.** New York: Grune & Stratton, 1962. vi, 153 p. \$3.75.—Clinical psychiatry, sociology, and personal experiences form the background for a psychoanalytically oriented analysis of individual and group self-destruction. The relationship between personal and mass suicidal tendencies is examined. Their causation, symbolism, treatment, and prevention is discussed.—R. Tyson.

1733. Sargent, D. **Children who kill: A family conspiracy.** *Soc. Wk.*, 1962, 7(1), 35-42.—A number of cases are cited of children whose killings appear to be traceable to the internalization of the desire of a parent, or of a parent figure, that the deceased person be injured.—G. Elias.

1734. Weiner, Irving B. (U. Rochester School Medicine & Dentistry) **Cross-validation of a Rorschach checklist associated with suicidal tendencies.** *J. consult. Psychol.*, 1961, 25(4), 312-315.—Martin's signs for suicidal tendency are significantly related to suicide attempts (concurrent validity) and to severity of psychiatric illness.—E. R. Oetting.

CRIME & DELINQUENCY

1735. Amos, William Earl. (U. Maryland) **A study of self-concept: Delinquent boys' accuracy in selected self-evaluations.** *Dissert. Abstr.*, 1961, 21(10), 3179.—Abstract.

1736. Anon. **The private intelligence of bank robbers: Two self-accounts.** *J. indiv. Psychol.*, 1962, 18(1), 77-88.—Adler's observations about the criminal find a high degree of confirmation in these self-descriptions reprinted from a federal penitentiary's inmate magazine.—A. R. Howard.

1737. Crain, William Willis. (Claremont Graduate School) **An experimental evaluation of the relationship of delay behavior to response to verbal self-stimulation using delayed auditory feedback.** *Dissert. Abstr.*, 1961, 21(10), 3157-3158.—Abstract.

1738. DeVos, George A., & Mizushima, Keiichi. (U. California, Berkeley) **The school and delinquency: Perspectives from Japan.** *Teachers Coll. Rec.*, 1962, 63(8), 626-638.—This survey of research on juvenile delinquency in Japan reveals similarities with the United States in backgrounds, characteristics, and problems.—H. K. Moore.

1739. Eskin, Lawrence David. (New York U.) **A study of some possible connections between criminal behavior and perceptual behavior.** *Dissert. Abstr.*, 1961, 21(10), 3163-3164.—Abstract.

1740. Halleck, S. L. **Juvenile delinquents: Sick or bad?** *Soc. Wk.*, 1962, 7(2), 58-61.—Delinquents are both "bad" and "sick," not one or the other. The delinquent is responsible for his behavior, despite his "illness"; but it is necessary to treat the emotional and personal factors which lead the individual to pursue asocial practices.—G. Elias.

1741. Horn, Wolfgang. (Taunusstr. 18, Butzbach/Hessen, Germany) **Bedingungsfaktoren und Begleiterscheinungen wiederholter Straffälligkeit.** [Causal factors and concomitant phenomena of recidivism.] *Z. exp. angew. Psychol.*, 1961, 8(4), 540-594.—Intuitive prognosis of recidivism is far less successful than prognosis based on tests. A

criminality questionnaire, improved by 8 successive item analyses, was presented to 3200 criminals and 629 noncriminals. 92 questions proved to have a significant relationship to recidivism.—W. J. Koppita.

1742. Huffman, Arthur V. (Illinois Dept. Public Safety) **The behavior patterns of criminals.** *J. soc. Ther.*, 1962, 8, 15-33.—A review of the causative factors of criminal behavior. A classification of the behavior systems of criminals is also outlined. The classification, consisting of 4 major groups or behavior patterns, is designed to facilitate research and for use as a diagnostic and prognostic tool. The major groups are: (a) no apparent criminal pathology, (b) personality demoralization, (c) personality disorganization, (d) sociopathic behavior reaction.—L. R. Witt.

1743. Hurwitz, Jacobs I., Hutcheson, B. R., & Cooper, Saul. (Boston U.) **Problems in refining the psychiatric assessment of juvenile delinquents.** *J. Hlth. hum. Behav.*, 1961, 2(4), 276-283.—Teams of 3 psychiatrists rated 100 juvenile delinquents in an attempt to ascertain the reliability and validity of psychiatric assessment. The methods used included interviews, observations, and ratings. Among the major findings were: (a) a positive relationship was obtained between level of inference and level of reliability, (b) ratings based on observations and background data were more reliable than ratings on background alone, and (c) a knowledge of previous difficulties with the law influenced diagnostic judgment more than did social and historical material.—L. A. Ostlund.

1744. Kelner, Yaakov. **Avaryanim tseirim nosherim mibet hasefer hatikhon.** [Young delinquents who drop out of the secondary school.] *Ofakim*, 1961, 15, 106-110.—25 young offenders in 1957-59 who dropped out of secondary schools were interviewed, each one of them 5 times. Possible forces influencing them were studied. In the beginning of their secondary school studies they behaved in a conformistic way; later a conflict arose with restrictive norms; afterwards, an identification process occurred with attitudes of the "saloon youth."—H. Ormian.

1745. Kundu, S., & Mukherjee, K. (Jodhpur) **Social behaviour of prisoners.** *Indian J. Psychol.*, 1958, 33(4), 269-273.—An "account of impressions gained from the prisons of a Central Jail" for first offenders. Every prisoner desires some type of recognition, acceptance, and prestige. If he fails to achieve this he shows hostility.—E. Y. Beemani.

1746. Mailloux, N. **La personnalité delinquante anormale e la ricerca contemporanea.** [The personality of the abnormal delinquent and contemporary research.] *Arch. Psicol. Neurol. Psichiat.*, 1962, 23(2), 151-171.—The innermost core of criminal personality still withstands technical investigation and classical interpretations. Criminals may be free from neurosis, psychosis, or perversions. On the basis of these findings, the position of criminality in relation to psychopathology should be reexamined.—L. L'Abate.

1747. Mizushima, Keiichi. **A study of the effects of psychotherapy on delinquents.** *Jap. J. Psychol.*, 1962, 32, 381-387.—It was found that psychotherapy served to increase the development of emotional change and maturity, served to decrease rule violations in the reformatory in which the study was con-

ducted, and that such effects seemed to occur more often in those individuals considered to be delinquent more on an emotional basis than upon a social basis.—*A. Barclay.*

1748. Morris, Albert. (Boston U.) An assessment of the Gluecks' studies in juvenile delinquency. *Sociol. soc. Res.*, 1962, 46(2), 156-166.—The Gluecks' studies provide extensive data on a wide range of factors significantly associated with serious, persistent delinquency. These differentiative factors become the basis for experience tables whose predictive value at a useful level of efficiency is suggested. The influence of the community on family relations and the extent to which personality changes occur after childhood are overlooked or underestimated. Some factors may be symptomatic rather than causal. Improved methods of research in causation are suggested.—*C. W. Page.*

1749. Mukherjee, K., & Kundu, S. (Calcutta, India) A study of birth order and family positions of the criminals. *Indian J. Psychol.*, 1961, 36(3), 127-132.—Of 120 male convicts in prison for various offenses, it was found that the largest proportion were neither first nor last born but of middle issue among sibs. This seems to be related to a neglect of discipline in the family, in comparison to more frequent severe or relaxed discipline for the first or last born criminals. There was some evidence that type of crime is related to order of birth.—*J. T. Cowles.*

1750. Peled, Elisheva. Nisayon hashuv letikun avaryanum tseirim. [An important experiment to improve juvenile delinquents.] *Hahinukh*, 1961-62, 34, 129-136, 292-301.—The spread of juvenile delinquency abroad and in Israel is discussed. The experiment of the Boston and Cambridge "laboratory" to investigate delinquency and the experiences gathered by the children's village of Kefar Haroe in Israel are broadly analyzed. Juvenile delinquents spend 1 day a week in Kefar Haroe in order to learn, play, and participate in film performances as well as in sport and artistic activities. The results of the Israeli experiment have been quite satisfactory.—*H. Ormian.*

1751. Petrie, Asenath; McCulloch, Rook, & Kazdin, Phoebe. (Harvard Medical School, Boston) The perceptual characteristics of juvenile delinquents. *J. nerv. ment. Dis.*, 1962, 134(5), 415-421.—70 young delinquent boys and girls in 3 institutions were compared with a control group on a perceptual task requiring size comparison via touch. Atypical perception was more characteristic of the delinquent group.—*N. H. Pronko.*

1752. Randolph, Mary H., Richardson, Harold, & Johnson, Ronald C. (San Jose State Coll.) A comparison of social and solitary male delinquents. *J. consult. Psychol.*, 1961, 25(4), 293-295.—"Solitary delinquents" show higher intellectual ability (WAIS), higher socioeconomic status, and, except for Ma, have more elevated MMPI profiles than those committing crimes with others.—*E. R. Oetting.*

1753. Schrag, Clarence. (U. Washington) Delinquency and opportunity: Analysis of a theory. *Sociol. soc. Res.*, 1962, 46(2), 167-175.—The opportunity theory, as formulated by Richard A. Cloward and Lloyd E. Ohlin (see 36: 1JO20C), is rich in its implications for delinquency causation and

control. Examined in terms of its logical, operational, and empirical adequacy the theory poses a number of questions concerning the accuracy of some of its postulates and theorems.—*C. W. Page.*

1754. Shanmugam, T. E., & Sundari, T. A. Difference between delinquent boys and non-delinquent boys in inhibition, disinhibition and personality traits. *Psychol. Stud., Mysore*, 1962, 7(1), 64-66.—No difference was found in delinquent and nondelinquent groups in the capacity for voluntary inhibition of a natural response. Capacity for disinhibition in delinquent boys was higher. The delinquent group had more neurotic traits, while the non-delinquent group revealed greater number of extraversion traits.—*U. Pareek.*

1755. Frankenstein, Carl. (Hebrew U., Jerusalem) Hitbagrut veavaryanut. [Adolescence and delinquency.] In Meir Shapira (Ed.), *Halakha umaase hahinukh hatikhon*. [Principles and practices in secondary education.] Jerusalem, Israel: Hebrew Univer. Secondary School, 1961. Pp. 115-129.—"The double prohibition (not to live like a child—not to live like an adult) is responsible for the nonrealistic character of the time consciousness of many adolescents in modern society as well as for the lack of continuity when looking at the past, present, and future. . . . Adolescence is not a 'bridge' but a 'pause.'" The adolescent's striving to imitate adults preserves his connections with reality. Some disturbances in his behavior are involved in the process of adolescence, specific to the "Western" culture. An attempt is made to analyze the way adolescents from all classes become delinquent.—*H. Ormian.*

1756. Shelley, Ernest L. V. (Michigan State U.) The effect of an organized counseling program on the anti-social themes elicited by the Thematic Apperception Test from youthful prison inmates. *Dissert. Abstr.*, 1961, 21(11), 3528.—*Abstract.*

1757. Yafe, Lester D. Netiya leavaryanut veanomias shel hamishpaha. [Delinquency proneness and family anomic.] *Megamot*, 1962, 12, 68-78.—Clinical experiences with delinquent or predelinquent youngsters suggest a strong relationship between 3 specific variables: lack of value consensus among family members, feelings of powerlessness, and problems of parental identification. An experimental field study strengthens the assumption of associations between these variables and their close relationship to delinquency proneness. These variables constitute a family anomic syndrome. 3 groups of Negro youngsters, students of different high schools in Ohio, were studied as to the existence of this syndrome across racial and class lines. (English summary)—*H. Ormian.*

1758. Yoshii, Naosaburo; Shimokochi, Minoru, & Tani, Kayoko. (Osaka U. School Medicine) The electroencephalograms in juvenile delinquents. *Folia psychiat. neurol. Jap.*, 1961, 15(2), 85-91.—EEGs characterized by theta waves or spikes were more frequent among delinquents than among a control group. Personality tests indicated that (a) the spike pattern was related to maladjustment, asociality, impulsiveness, and anxiety and (b) the theta pattern was related to emotional instability, asociality, and immaturity. The EEG pattern was also a function of the nature of the criminal offenses of the delinquents.—*W. A. Wilson, Jr.*

1759. Zald, Mayer Nathan. (U. Michigan) Multiple goals and staff structure: A comparative study of correctional institutions for juvenile delinquents. *Dissert. Abstr.*, 1961, 21(11), 3541-3542.—*Abstract*.

1760. Zubizarreta Peris, José Ramón. (Facultad Ciencias Medicas, Asunción, Paraguay) Salud mental y delincuencia juvenil. [Mental health and juvenile delinquency.] *Acta neuropsiquiat. Argent.*, 1961, 7(3), 182-184.—The etiology and prophylaxis of juvenile delinquency are discussed. One of the major factors is a growing disrespect for authority, which indicates parental failure, since respect for authority grows out of respect for parental authority. Behavioral clinics, in which difficulties in adjustment to society can be handled on an ambulatory basis, are recommended as part of a prophylactic program.—*W. W. Meissner*.

PSYCHOSES

1761. Bobon, J., & Maccagnani, G. L'expression plastique en psychopathologie: I. Les "signes plastiques." [Plastic expression in psychopathology: I. "Plastic signs."] *Acta neurol. psychiat. Belg.*, 1961, 61, 823-842.—"In the frame of a psychopathology of the plastic expression, the authors draw out the notion of "Plastic signs." It refers to signs sensu stricto which, although they keep their value as signs or not, constitute an essentially plastic expression; that means that they appear in the production of the patient as plastic forms and not as verbal information. Generally, the sign-drawing, pure expressivity, is not an instrument of communication. Nevertheless, in a patient who is autistic since many years, it is in a drawing and as a drawing that appears, in a unique way, the key-phrase of the delirium."—*V. Sanua*.

1762. Bobon, J., & Maccagnani, G. L'expression plastique en psychopathologie: III. Les dessins-signes. Un cas de parasymbolie graphique délicate: La langue "déologique." [Plastic expression in psychopathology: III. The drawing-signs. A case of parasymbolic graphism caused by illness: The "deological" language.] *Acta neurol. psychiat. Belg.*, 1961, 61, 849-865.—"In the field of their research on analogies between verbal expression and plastic expression, the authors have studied, during eight years, a graphic pseudo-language of which they have analyzed the main characteristics. This language is drawn; it is a drawing of each letter which lays the foundations of the symbolic interpretation of the patient or, in another way, it is the drawing which gives its value to the linguistic sign (drawing-sign). This language is the expression of valorizing delusions, of mystico-erotic type. It perfectly translates the morbid rationalism and the geometrical attitude of mind of its author. It sets the problem of regressions in psychopathology: 1) it shows a playful and magical thought; 2) it is of ideo-pictographic type, as in hieroglyphical writing."—*V. Sanua*.

1763. Brattemo, Carl-Erik. (Sidsjöns Mental State Hosp., Sundsvall, Sweden) Interpretations of proverbs in schizophrenic and depressive patients. *Acta psychiat. Scand., Copenhagen*, 1961, 37(3), 193-197.—Responses to a Swedish proverbs test made by 20 schizophrenics and 20 depressives were categorized in predetermined alternatives as abstract and concrete, right and wrong, and were analyzed after patients

had been matched according to age and intelligence. The thinking of the schizophrenic groups was dominated by illogical and abstract associations.—*R. Kaelbling*.

1764. Brattemo, Carl-Erik. Interpretations of proverbs in schizophrenic and depressive patients. *Acta psychol., Amsterdam*, 1961, 18(5), 342-350.—Unlike the results of other workers, these findings show a concrete reaction to proverbs in the depressed and not in schizophrenic. Schizophrenic thinking was illogical and abstract, in accord with Bleuler's viewpoint that such thinking is autistic.—*G. Rubin-Rabson*.

1765. Callieri, B., & Priori, R. Contributo allo studio dell'esperienza psicotica dermatozoica, zooptica e zoopatica. [Contribution to the study of psychotic perception of inner, near, and remote space.] *Arch. Psicol. Neurol. Psychiat.*, 1962, 23(2), 109-148.—Phenomenological, psychopathological, and clinical analysis of delusional experiences concerned with animal contents. 3 different fields of perceived inner, near, and remote space constitute the frame of reference for this inquiry.—*L. L'Abate*.

1766. Golburgh, Stephen Jon. A study of the vocational interests of four types of psychotic subjects. *Dissert. Abstr.*, 1961, 21(12), 3851.—*Abstract*.

1767. Havener, Philip Henry. (Vanderbilt U.) Distortions in the perception of self and others by persons using paranoid defenses. *Dissert. Abstr.*, 1961, 22(1), 322-323.—*Abstract*.

1768. Lapkin, Benjamin. (New York U.) The relation of primary process thinking to the recovery of subliminal material. *Dissert. Abstr.*, 1961, 21(10), 3165-3166.—*Abstract*.

1769. Lemert, E. M. (U. California, Davis) Paranoia and the dynamics of exclusion. *Sociometry*, 1962, 25(1), 2-20.—A 1st case study based on 35 case records and interviews with families of an additional 44 public commitments was followed by "a more refined and hypothesis-directed study" of 8 different cases with prominent paranoid characteristics but no hallucinations or intellectual impairment. The thesis "that members of communities and organizations do unite in common effort against the paranoid person prior to or apart from any vindictive behavior on his part. The paranoid community is real rather than pseudo in that it is composed of reciprocal relationships and processes whose net results are informal and formal exclusion and attenuated communication," is extensively examined and discussed.—*H. P. Shelley*.

1770. Maccagnani, G., & Bobon, J. L'expression plastique en psychopathologie: II. Un exemple d'identité entre un néomorphisme et le néographisme qui le nomme. [Plastic expression in psychopathology: II. An example of identity between a "neomorphism" and the corresponding "neographism."] *Acta neurol. psychiat. Belg.*, 1961, 61, 843-848.—"In the field of their research on analogies between verbal expression and plastic expression, the authors report an exceptional case of identity between a neomorphism and the neographism which names it. In a chronological series of drawings and paintings, at one time the neographism is integrated to the totality of the new form, at another time it is the neographism of which the structure is an element of the whole drawing. The pathological verbal signifying and the plastic signified are forming, for the patient, the one and only formal reality."—*V. Sanua*.

1771. Racamier, P. C. et al. (Hôpital Psychiatrique, Prémontré, Aisne) *La mère et l'enfant dans les psychoses du post-partum*. [Mother and child in post-partum psychoses.] *Evolut. psychiat.*, 1961, 26(4), 525-570.—It is suggested that the observation and treatment of the mentally ill mother and her child can be accomplished best in specialized mother-baby units. Such facilities, as well as therapeutic methods, are outlined. Under such conditions, favorable results are more rapid. Clinical and psychodynamic descriptions are offered of depressive states, which appear during the nursing period, and delusional states, which appear just after childbirth. These are related to the concept that since motherhood is a developmental state of the feminine personality, such disturbances must be viewed in the context of this integrational process. (36-item bibliogr.)—L. A. Ostlund.

1772. Reca de Acosta, Telma. (U. Buenos Aires) *Psicosis infantiles*. [Child psychoses.] *Acta neuropsychiat. Argent.*, 1961, 7(3), 170-178.—The symptomatology, frequency, etiology, prognosis, and treatment of childhood psychoses are discussed. The following conclusions are drawn: (a) the designation of psychosis is applied to various groups: atypical development, autism, symbiotic psychosis, anaclitic depression, schizophrenia, depressive psychosis, manic-depression, and emotional shock; (b) the distinction should be made between schizophrenic personality (as described by Bender) and schizophrenic psychosis; (c) the onset of childhood psychosis can be acute or insidious, but an acute onset is usually preceded by psychotic features; (d) the etiology usually involves a constellation of psychogenetic, organic, and genetic factors; and (e) a high percentage have organic lesions, particularly in the mesencephalon.—W. W. Meissner.

1773. Rolla, Edgardo H., & Marín de Rolla, Josefina. *El niño y su grupo familiar*. [The child and his family group.] *Acta neuropsychiat. Argent.*, 1961, 7(3), 190-193.—When psychosis affects one of the members of a well-defined group such as the family, it is a symptom of the intragroup situation of the family. The member affected by psychosis is nothing more than a repository for the anxieties of the other members of the family. Rather than speaking of "schizophrenogenic mother or father," it is probably more correct to speak of a "schizophrenic family."—W. W. Meissner.

1774. Skipper, James K., Jr. (Northwestern U.) *Functional significance of the nurse role: An evaluation*. *J. Hlth. hum. Behav.*, 1962, 3(1), 41-45.—Thorner's theoretical analysis of the nurse role was tested experimentally. 239 students and practicing nurses took a questionnaire concerning their conceptions of the nurse's attitudes, behavior, and role. "... the data indicate that the nurses in the sample felt that patients should be treated as persons rather than as cases. Warm, cordial nurse-patient relationships were approved; but close, personal, emotional relationships were not." Suggestions for a more useful theoretical analysis follow.—L. A. Ostlund.

1775. Speier, Anny. *Características del dibujo del niño psicótico y su significado simbólico*. [Characteristics of the drawings of the psychotic child and their symbolic significance.] *Acta neuropsychiat. Argent.*, 1961, 7(3), 202-204.—The drawings of 18 psychotic children were studied and analyzed into

formal aspects, symbolic meaning, content, color, symbolism of the house, human figure, fragmentation, and omission of parts.—W. W. Meissner.

1776. Swift, Sheldon. (Los Angeles) *Folie à deux?* *Arch. Dermatol.*, 1961, 84, 932-934.—Laseque and Falret's introduction of the term "folie à deux" in 1877, following the 1st recorded case by Berlyn in 1819, has produced a number of reports on the "psychosis of association." Dermatologic, psychiatric, and psychological data are reported in this study of a middle-aged, married couple with the mutual complaint of hair loss at about the same time, several months previous to their presenting themselves for treatment. The author offers alternative suggestions, drawn from dermatology and psychological medicine, about the etiology of this instance of alopecia areata. This is the 1st report of simultaneous alopecia in persons without a direct blood relationship.—I. N. Mensh.

1777. van der Horst-Oosterhuis, C. (Wilhelmina Gasthuis, Paviljoen III, Amsterdam, Holland) *Quelques idées relatives à la structure du monde des psychotiques*. [Some ideas concerning the structure of the world of psychotics.] *Evolut. psychiat.*, 1961, 26(4), 511-522.—For over 10 years, over a 100 neurotics and some psychotics incapable of verbal communication have been studied by means of pictures and designs which the psychoanalyst encourages them to draw. Spontaneous drawings include faces, animals, arrows, etc. These manifestations enable the therapist to penetrate the unconscious world of the patient, for the lines provide a focus for discussion in which freedom of verbalization and gesture is encouraged. In the patient's private world, physiological sensations are frequent, varied, and abnormal. However, they function as symbols which provide the therapist with clues to their interpretation, and are essential as a basis for diagnosis and treatment.—L. A. Ostlund.

1778. Wright, Jack Mason. (U. Colorado) *Attribution of social responsibility and self concept*. *Dissert. Abstr.*, 1961, 21(11), 3530.—Abstract.

Schizophrenia

1779. Badgley, Theodore M., Holloway, Harry C., & Hedlund, James L. (Walter Reed Army Medical Cent., Washington, D. C.) *Schizophrenia on duty*. *Amer. J. Psychiat.*, 1962, 118(10), 916-920.—"In terms of percentage, given 100 men found to have schizophrenia while in military service and hospitalized at an Army neuropsychiatric treatment center, 93 improved sufficiently to be released to their own care; 25 were returned to active duty; 14 remained on the job until completion of obligated service or for more than 2 years; 12 of these were rated as average or better by the using agency in terms of effective work and adequate social adjustment."—N. H. Pronko.

1780. Bateson, Gregory. (Ed.) (VA Hosp., Palo Alto, Calif.) *Perceval's narrative: A patient's account of his psychosis, 1830-1832*. Stanford, Calif.: Stanford Univer. Press, 1961. xxii, 331 p. \$6.75.—Long before there were any psychiatric theories regarding schizophrenia, John Perceval, son of a Prime Minister of England, wrote this autobiographical account of his 3 years of schizophrenic illness. His story is important from a scientific point of view because it was not influenced by Freudian and other

theoretical viewpoints which have subsequently been proposed. Perceval tells of his illness and recovery with remarkable vigor and insight. The result is a uniquely perceptive account by a schizophrenic of his own reactions; his hallucinations; and the general turmoil, stress, and discomfort of his conditions.—S. B. Coslett.

1781. Chapman, L. J., Burstein, A. G., Day, Dorothy, & Verdone, P. (U. Kentucky) Regression and disorders of thought. *J. abnorm. soc. Psychol.*, 1961, 63(3), 540-545.—Utilizing 2 tests (see 35: 5236; 36: 4JQ14C) devised to assess use of various kinds of words, the responses of elementary school children were compared with the responses of a previously obtained sample of schizophrenics. The purpose of the comparison was to test the assumption that schizophrenia involves a regression to a more primitive, infantile stage, and that the thinking of the schizophrenic would resemble that of the child. On some of the tasks, the thinking of the children and the schizophrenic were similar; on others, the children and the organics were similar. The literal use of the term regression re: schizophrenia was rejected. Methodological problems of research in this area are discussed.—G. Frank.

1782. Ciotola, Paul Vincent. (U. Missouri) The effects of two contradictory levels of reward and censure on schizophrenics. *Dissert. Abstr.*, 1961, 22(1), 320.—Abstract.

1783. DeWolfe, Ruthanne Katherine Sobota. (Northwestern U.) The effect of drive level on the language behavior of process and reactive schizophrenics. *Dissert. Abstr.*, 1961, 21(10), 3162-3163.—Abstract.

1784. Ebner, Eugene. (Purdue U.) Verbal conditioning in schizophrenia as a function of degree of social interaction. *Dissert. Abst.*, 1961, 22(1), 322.—Abstract.

1785. Feffer, M. H. (Yeshiva U.) The influence of affective factors on conceptualization in schizophrenia. *J. abnorm. soc. Psychol.*, 1961, 63(3), 588-596.—2 groups of schizophrenics, distinguished as to their capacity for abstract thinking (see 15: 3039), and normals were presented with stimuli composed of groupings of words constructed so that affect-laden words could be placed in the figure or ground of a gestalt. Schizophrenics characterized as demonstrating "concrete" thinking avoided affect-laden words whether they appeared in the figure or ground of the tachistoscopically presented gestalten. The finding tends to validate the assumption that generalized withdrawal in some schizophrenics is a product of withdrawal from affect-laden stimuli.—G. Frank.

1786. Feldstein, Stanley. (Columbia U.) The relationship of interpersonal involvement and affectiveness of content to the verbal communication of schizophrenic patients. *Dissert. Abstr.*, 1961, 21(11), 3523-3524.—Abstract.

1787. Feldstein, Stanley, & Jaffe, Joseph. (Columbia U.) Vocabulary diversity of schizophrenics and normals. *J. speech hear. Res.*, 1962, 5, 76-78.—30 male schizophrenic and 30 nonpsychiatric (normal male patients with a similar age range (a mean age of 35.5 years) and average intelligence were studied on stimulus material consisting of 4 sets of 5 story-telling pictures. The schizophrenics were receiving tranquilizers during the study. The mean

segmental TTRs (type token ratios) and the TTR variances were obtained from speech samples of the 2 groups and were analyzed by means of analysis of variance. It was found that neither the means nor the variance scores differentiated between the speech of the schizophrenic and normal samples.—M. F. Palmer.

1788. Fould, G. A., & Dixon, Penelope. (Runwell Hosp., Wickford, Essex) The nature of intellectual deficit in schizophrenia and neurotics: I. A comparison of schizophrenics and neurotics. *Brit. J. soc. clin. Psychol.*, 1962, 1(1), 7-19.—Progressive Matrices and Mill Hill Vocabulary Scale scores of 270 schizophrenics and 280 neurotics were compared. It was concluded that, although there was a considerable degree of intellectual deficit in the schizophrenics, this deficit was confined to the initial impact of the illness and was not progressive.—C. M. Franks.

1789. Goldman, Alfred E. (Morristown State Hosp., Pa.) A comparative-developmental approach to schizophrenia. *Psychol. Bull.*, 1962, 59(1), 57-69.—A comparative-development theory, in order to encompass schizophrenic processes, must introduce constructs which suggest a parallelism of various aspects of schizophrenia with the developmental patterns of childhood. The functions of emotion, perception, learning, thinking and language, socialization, and motor functions are examined from this viewpoint. By showing the essential similarity of structure between young children and schizophrenics, it is concluded that the approach is helpful in understanding schizophrenics.—W. J. Meyer.

1790. Grunspun, Haim, & Rossetti, Mafalda. (U. Católica, São Paulo) Terapêutica psicológica e medicamentosa da esquizofrenia infantil. [The psychological and medicinal therapy of childhood schizophrenia.] *Acta neuropsiquiatr. Argent.*, 1961, 7(3), 179-180.—Combined treatment with chlorpromazine and individual psychotherapy is described. Results of 6 cases are presented.—W. W. Meissner.

1791. Guertin, W. H. (U. Florida) Are differences in schizophrenic symptoms related to the mother's avowed attitudes toward child rearing? *J. abnorm. soc. Psychol.*, 1961, 63(2), 440-442.—Mothers of hospitalized schizophrenics were mailed a questionnaire—The Parental Attitude Research Instrument (PARI), Schaefer & Bell, 1958—concerning aspects of the family during the period of development of the patient. The family settings of the currently better adjusted schizophrenics were described as encouraging verbalization, comradeship, and sharing, but also revealed marital conflict; the patient was described as having been withdrawn and psychopathic. The family setting of the pseudo-neurotic schizophrenic was characterized as not involving maternal isolation, irritability, or a martyr complex; and the patient was described as neurotic. In both groups the family setting was described as democratic. Whether or not the current attitudes are consistent with the actual past events remains questionable; the results, however, pointed out the possibility that patients with different schizophrenic symptoms may come from different home environments.—G. Frank.

1792. Guntrip, H. (Leeds U.) The schizoid problem, regression, and the struggle to preserve

an ego. *Brit. J. med. Psychol.*, 1961, 34, 223-244.—Schizoid regression is related to difficulties surrounding the earliest phases of ego development. The particular orientation is an elaboration of views put forward by Melanie Klein and Fairbairn. The ultimate regression involves the split "into an active sado-masochistic Oral Ego . . . and a passive Regressed Ego which seeks to return to the antenatal state of absolute passive dependent security." There is a brief discussion of implications for psychotherapy.—C. L. Winder.

1793. Ilanit, Nathan. (U. Southern California) Some psychological correlates of the process-reactive concept of schizophrenia. *Dissert. Abstr.*, 1961, 21(12), 3852.—Abstract.

1794. King, H. E. (U. Pittsburgh) Anticipatory behavior: Temporal matching by normal and psychotic subjects. *J. Psychol.*, 1962, 53(2), 425-440.—The performance of 30 normal and 30 schizophrenic Ss was observed in an attempt to synchronize a simple motor response with a series of regularly recurring temporal stimuli (auditory). Neither group made exactly coincident responses; the normal group showed a consistently negative and the psychotic group a consistently positive constant error. The differences were significant for most task measures. The findings are discussed in terms of possible relationships to the negative time-error, classical time-judgment, voluntary conditioning, and the psychomotor retardation characteristic of severe behavior disorder.—Author abstract.

1795. Koppenhaver, Neil David. (Purdue U.) The effects of verbal and non-verbal reinforcement on the performance of schizophrenic subjects. *Dissert. Abstr.*, 1961, 22(1), 323-324.—Abstract.

1796. Krinsky, Leonard W. (South Oaks Psychiatric Hosp., N. Y.) Personal beliefs of schizophrenics and their parents. *J. Psychol.*, 1962, 53(2), 387-397.—"Questionnaires designed to measure beliefs regarding innocuous topics, social issues and mental illness were administered once to 40 acutely and 40 chronically ill [male] schizophrenics" and twice to their parents. The parents recorded their own beliefs on one form and what they thought to be their children's beliefs on the other. "Contrary to prediction, mothers and fathers appeared to be more alike than different in relating their beliefs to those of their patient-offspring. The differences which did occur showed fathers to be more projecting and identified but mothers to have more actual awareness of their sons' beliefs." The parents of the chronically ill maintained greater psychological distance than those of the acutely ill patients. (22 ref.)—E. Y. Beeman.

1797. Loch, Wolfgang. Anmerkungen zur Pathogenese und Metapsychologie einer schizophrenen Psychose. [Notes on the pathogenesis and metapsychology of a schizophrenic psychosis.] *Psyche, Stuttgart*, 1962, 15(11), 684-720.—The basic problem in the psychotherapy of schizophrenia, as well as in personality development, is: how can a primary stable identification be secured, so that there is a basis for further ego maturation? The problems encountered in the psychoanalytic therapy of a 22 year old schizophrenic woman are used to illustrate the typical difficulties of treatment.—E. W. Eng.

1798. Long, R. C. (U. Texas) Praise and censure as motivating variables in the motor behavior and learning of schizophrenics. *J. abnorm. soc. Psychol.*, 1961, 63(2), 283-288.—Hullian assumptions regarding drive level were utilized to predict the performance of acute and chronic schizophrenics on learning tasks of varying complexity. Ss were exposed to 3 conditions of reinforcement: censure, praise, and neutral (neither censure nor praise), and faced with simple and complex learning tasks. Acute schizophrenics responded differently from the chronic Ss to the conditions of reinforcement. The performance of the acute group was facilitated on the 2nd task by the experience of being told they were wrong on the 1st; this was not so with the chronic schizophrenics.—G. Frank.

1799. McGhie, A. (Dundee Royal Mental Hosp.) A comparative study of the mother-child relationship in schizophrenia: I. The interview. *Brit. J. med. Psychol.*, 1961, 34, 195-208.—The comparison is of interview data obtained from mothers of schizophrenic, neurotic, and normal adults. There were 20 Ss in each of the matched groups. Overlap of groups, particularly the neurotic and schizophrenics, is noted. Emphasis is given to the very poor marital adjustment reported in the schizophrenic group and to the mothers' overconcern about past physical illnesses in the neurotic group. The results are reported.—C. L. Winder.

1800. McGhie, A. (Dundee Royal Mental Hosp.) A comparative study of the mother-child relationship in schizophrenia: II. Psychological testing. *Brit. J. med. Psychol.*, 1961, 34, 209-221.—Mothers of adult schizophrenics, neurotics, and normals were compared (20 Ss in each group). On a child-rearing questionnaire, mothers of schizophrenics seem overly controlling and seem to fear sex. Sentence completion results indicate greatest mental health among mothers of normals and least among schizophrenics' mothers. Rorschach performances suggest similar pathology of mother and offspring. There is discussion of the findings.—C. L. Winder.

1801. Mitscherlich, Melitta. (Lindemannstr. 40, Düsseldorf, Germany) Zwei Fälle von psychogenem Mutismus. [Two cases of psychogenic mutism.] *Z. psycho-som. Med.*, 1961, 7(3), 172-175.—In a 14-year-old girl and in a 15-year-old boy mutism developed as a symptom of total withdrawal from and a protest-reaction against a world with overpowering demands. The boy was initially diagnosed as schizophrenic. In both cases the symptom was used to avoid responsibilities at a time when sexual impulses first appeared and could not be dealt with. Both patients were cured in a short time with the "scenotest" method.—I. Neufeld.

1802. Modell, Arnold H. (Harvard U.) Hallucinations in schizophrenic patients and their relation to psychic structure. In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 166-172.—10 patients willing to talk about their hallucinations are studied. Hallucinatory "voices" are identified as formerly loved persons, principally the parents, who . . . are fused to the self. . . . They are constant objects and the patient is the center of their world . . . [a defence] against the reality of separation and relates to the early diadic mother-child relationship." These results are related to psychoanalytic concepts.—J. B. Thompson.

1803. Overall, J. E., Gorham, D. R., Shawver, J. R. (VA Hosp., Perry Point, Md.) **Basic dimensions of change in the symptomatology of chronic schizophrenics.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 597-602.—A reanalysis of previously presented data (Shawver et al, 1959) was done to determine what personality factors, as measured by the Lorr Multidimensional Scale for Rating Psychiatric Patients (1953), changed over a period of 6 months of hospitalization. Factor analysis of change scores (6-month ratings subtracted from initial) on the 42-item scale resulted in 6 independent factors. Change was reflected in factors of: mental disorganization, thought guilt, depression, and anxiety. Mental disorganization was seen to be the central factor or primary process in schizophrenic.—G. Frank.

1804. Pokorny, A. D. (VA Hosp., Houston, Tex.) **Background factors in schizophrenia.** *J. nerv. ment. Dis.*, 1962, 134(1), 84-87.—"Forty white male veteran schizophrenics were studied by means of a detailed standardized interview covering nine areas of life adjustment, including family background. The findings were compared with similar data available on two groups of white male veteran tuberculosis patients, those completing treatment ('regular discharge'), and those leaving treatment prematurely ('irregular discharge'). No significant difference in family background factors was found; however, compared to the regular-discharge tuberculosis group, the schizophrenic group showed significantly poorer adjustment in grade school educational achievement, social relations in all age periods, health during childhood, participation in religious activities during childhood, amount of alcoholism, military adjustment, and adult occupational adjustment. It may be that these represent factors leading to schizophrenia, but—equally likely—they may be the early symptoms of schizophrenia."—N. H. Pronko.

1805. Robertson, J. P. S. (Netherne Hosp., Surrey) **Perceptual-motor disorders in chronic schizophrenia.** *Brit. J. soc. clin. Psychol.*, 1962, 1(1), 1-6.—From 70 severely deteriorated schizophrenics 12 Ss showing extreme perceptual-motor disturbances were compared with 12 Ss showing little of such impairments in a series of everyday perceptual-motor tasks such as cleaning shoes. Performance was analyzed in terms of 19 basic disorders. The marked differences between the 2 groups were stable over a short period and apparently unrelated to general neuropsychiatric status, social variables, and differential aptitudes. Partly because of the resemblance of the disorders of those produced by certain drugs and by anoxia it was suggested that the basis of the contrast between the 2 groups was biochemical and fundamental to the etiology of schizophrenics.—C. M. Franks.

1806. Rosenfeld, Joseph G. (Temple U.) **The effects of social reinforcing variables on the word recognition responses of schizophrenic and non-psychiatric patients.** *Dissert. Abstr.*, 1961, 22(1), 326.—Abstract.

1807. Ryan, Leo Robert. (U. Colorado) **An exploratory study of some aspects of listening of schizophrenics.** *Dissert. Abstr.*, 1961, 21(10), 3168-3169.—Abstract.

1808. Rycroft, C. **An observation on the defensive function of schizophrenic thinking and delu-**

sion-formation. *Int. J. Psycho-Anal.*, 1962, 43(1), 32-39.—The dynamics are described of a schizophrenic patient unsuccessfully psychoanalyzed for 4 years. Similarities are pointed out between this patient and Freud's famous case of Schreber.—G. Elias.

1809. Salzinger, K., & Pisoni, Stephanie. (New York State Dept. Mental Hygiene) **Some parameters of the conditioning of verbal affect responses in schizophrenic subjects.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 511-516.—The study explored the effect of verbal reinforcement procedures with a sample of hospitalized schizophrenics. Comparisons were made of the reinforcement effect when it was given at the beginning vs. in the middle of a 30-min. interview. No differential reinforcement effect in terms of timing was found. Moreover, for verbal reinforcement per se to be effective, a number of reinforcements were necessary.—G. Frank.

1810. Schulz, Clarence G. (Chestnut Lodge, Rockville, Md.) **Identität und Genesungsprozess im Verlauf einer schizophrenen Erkrankung.** [Identity and the process of recovery in the course of a schizophrenic illness.] *Psyche, Stuttgart*, 1961, 15(9), 532-560.—"In this paper I have summarized the course of treatment of a schizophrenic reaction by intensive psychotherapy extending over a period of four years. I have considered the recovery of the patient as a re-establishment of his identity and the process of recovery as being parallel to the stages of personality development as conceptualized in Erikson's 'phase-specific social crises.'"—E. W. Eng.

1811. Schwartzman, Alex E., & Douglas, Virginia I. (McGill U., Canada) **Intellectual loss in schizophrenia: Part I.** *Canad. J. Psychol.*, 1962, 16(1), 1-10.—50 schizophrenic veterans demonstrated an average loss of 6 IQ points, with a mean interval of 10 years between premorbid and morbid tests; while a matched sample of 30 normal Ss typically gained the equivalent of 6 IQ points on the Canadian Revised "M." Speed did not account for the deficit. Mechanical aptitude and nonverbal subtests reflected greater deficit than the verbal tests. Ss diagnosed as chronic showed greater deficit than the acute cases.—R. S. Davidson.

1812. Schwartzman, Alex E., & Douglas, Virginia I., & Muir, William R. (McGill U., Canada) **Intellectual loss in schizophrenia: Part II.** *Canad. J. Psychol.*, 1962, 16(2), 161-168.—A follow-up study of 23 of the 50 veterans described in a previous study (see 37: 1811). All were first tested on the Canadian Revised Examination "M" in 1942 when they enlisted, again in 1952 when all but 1 of the present sample were hospitalized for schizophrenia, and last in 1960, when 10 of the 23 were patients. The patients, still under medication, decreased steadily in "M" scores during the 17 year period; but the ex-patients, who had decreased significantly on the 2nd test, increased again to almost equal their premorbid scores.—R. S. Davidson.

1813. Searles, H. F. (Chestnut Lodge) **Phases of patient-therapist interaction in the psychotherapy of chronic schizophrenia.** *Brit. J. med. Psychol.*, 1961, 34, 169-193.—The therapeutic relationship must be understood, in part, in terms of the "feeling-involvements in which the therapist as well as the patient becomes caught up." There is a delineation of what the author has found to be a typical "over-all

pattern of the psychotherapeutic course which that relationship follows over the years of the patient's treatment."—C. L. Winder.

1814. Spoerri, T. *Der Ausdruck der gepressten Sprechstimme ("Würgstimme") bei chronischen Schizophrenen.* [Symptoms of constricted voice ("choked speech") in chronic schizophrenics.] *Confin. psychiat., Basel*, 1961, 4, 123-132.—A study of the voice as an expressive gesture in 13 catatonic schizophrenics showed marked decrease of vowel sounds with corresponding increase of consonantal sounds, making the voice sound "choked." Usually alternating with the "choked voice" was a loose and open "normal voice." The "choked voice" is expressive of interpersonal remoteness and impaired interest in the surroundings.—E. W. Eng.

1815. Sullivan, Harry Stack. *Schizophrenia as a human process.* New York: Norton, 1962. xxxv, 363 p. \$6.50.—"This book covers all the major articles that Sullivan wrote from the beginning of his writing career (1924) through 1935, either through the articles themselves or in the Commentaries." There are also a few post-1935 articles in which schizophrenia is the central subject. The "Introduction" and "Commentaries" were written by Helen Swick Perry. "Harry Stack Sullivan, the Man" by Clara Thompson is also reprinted.—E. Y. Beeman.

1816. van Krevelen, D. Arn., & Kuipers, Christine. *The psychopathology of autistic psychopathy.* *Acta paedopsychiat.*, 1962, 29(1), 22-31.—Using Bleuler's term of "autistic psychopathy" (the inability to make contacts, to react to the world) the authors find Asperger's observations sound: these children are often only children, speech develops slowly, they show original intelligence, develop their own methods, are unable to achieve empathy, and lack intuition. The likeness to the father in these respects makes it probable that autistic psychopathy is constitutionally rooted.—G. Rubin-Rabson.

1817. Will, Otto Allen, Jr. (U. Maryland) *Hallucinations: Comments reflecting clinical observations of the schizophrenic reaction.* In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 174-182.—Hallucinations are considered as reflecting certain aspects of the social field in addition to the patient's participation in earlier interpersonal fields. Hallucinations are symbolic representations of interpersonal experiences, many of which have been kept out of awareness in anxiety reduction, and manifested in situations of increased anxiety. In psychotherapy attention is devoted to providing an environment, in which the therapeutic relationship can be observed in order to reduce anxiety and increase self esteem. (36 ref.)—J. B. Thompson.

Affective Disorders

1818. Dietrich, Heinz. *Analyse sozio-kultureller Faktoren bei depressiven Patientinnen.* [Analysis of sociocultural factors in female depressive patients.] *Confin. psychiat., Basel*, 1961, 4, 110-122.—A study of the social backgrounds of 145 female "endogenous depressive" patients of rural or lower-class urban Bavarian background. The average age of onset of illness was 35 years. Outstanding features of the patients as a group were: socially and emotionally dependent childhood, good to high achievement as pupils and as wives, upward social strivings, lack of inde-

pendence in work position, and a change of objective status preceding the outbreak of illness.—E. W. Eng.

1819. Leon, Carlos A. (U. del Valla) *El contexto temporoespacial como factor en la formación de síntomas depresivos.* [The temporal and spatial context as a factor in the formation of depressive symptoms.] *Acta neuropsiquiat. Argent.*, 1961, 7(4-5), 253-260.—Sensorial association has been restored to a prominent place among the genetic factors of phobic syndromes. Study of 6 clinical cases reveals the following characteristics: (a) they all include an original experience which was charged with depressive affect; (b) a sensory stimulus appears associated spatially or temporally with the original experience; (c) this stimulus evokes a vivid repetition of the original experience; (d) this is so threatening that the patient seeks every possible means to avoid it; (e) when the original experience contains depressive and anxious elements, these acquire phobic and obsessive characteristics; and (f) all cases show clear unconscious motivation for the appearance of the original symptoms and their symbolic relation with the sensory context of the relived experience. (25 ref.)—W. W. Meissner.

Physiological Correlates

1820. Beckett, Peter G. S., Senf, Rita; Frohman, Charles E., Tournay, Garfield, & Gottlieb, Jacques S. (Lafayette Clinic) *Relations between energy transfer systems and the symptoms of schizophrenia.* *Amer. J. Psychiat.*, 1962, 118(11), 995-1003.—"Intracellular energy producing metabolic systems were investigated in erythrocytes before and after insulin stress in 10 control, 10 acute schizophrenic, and 10 chronic schizophrenic male subjects. Following complete clinical study 28 ratings of symptoms and course of illness were made for each subject. Correlation coefficients (r's) were computed between the biochemical and clinical variables. It was found that the primary symptoms were directly related to the failure of mobilization after stress of the compound fructose-1,6-di phosphate. In contrast, the secondary symptoms were not significantly related to biochemical variables. Scores indicating a chronic illness and a poor outcome at followup were found to be directly related to another very important substance in this metabolic scheme. This substance is adenosine triphosphate (ATP). The possible significance of these findings is discussed in relation to a hypothetical serum factor in schizophrenia."—N. H. Pronko.

1821. Bernaldo Moreno, Victoria. (Facultad Farmacia, Lima, Peru) *Serotoninemia en oligofrénicos y esquizofrénicos.* [Serotoninemia in oligophrenics and schizophrenics.] *Acta neuropsiquiat. Argent.*, 1961, 7(4-5), 261-268.—The literature on the relation of serotonin levels in the blood and mental illness is reviewed and the techniques of determination are described. Udenfriend's technique and the spectrophotometric technique of Beckman were used to study serotonin levels in 61 schizophrenics and 17 oligophrenics. No significant difference was found between them, and the concentration of serotonin in the blood of the disturbed patients was similar to that in the apparently sane. (63 ref.)—W. W. Meissner.

1822. Heath, Robert G., Leach, Byron E., & Verster, F. de Balbian (Tulane U.) *Mechanisms*

related to the hallucinogenic effects of taraxein. In Louis West (Ed.), *Hallucinations* (see 37: 1588). Pp. 183-195.—A brief description of an "investigative program to correlate the basic biologic changes with behavior in . . . schizophrenia." Included is "a review of correlations of physiologic activity of the brain with psychotic behavior and a discussion of studies in which a substance found only in the serum of schizophrenics has been demonstrated to be of importance in the induction of these physiologic and behavioral changes, including auditory hallucinations." (22 ref.)—J. B. Thompson.

1823. Suwa, Nozomi; Yamashita, Itaru; Owada, Hiroshi; Shinohara, Seiichi, & Nakazawa, Akiko. (Hokkaido U. School Medicine, Hokkaido, Japan) **Psychic state and adrenocortical function: A psychophysiologic study of emotion.** *J. nerv. ment. Dis.*, 1962, 134(3), 268-276.—44 Ss (including normal controls, schizophrenics, and psychoneurotics) were studied for relationships between psychological state and adrenocortical activity as revealed by circulating eosinophil count, urinary 17-hydroxycorticoids, and uropepsin. Normals and patients in remission showed greater stability of adrenocortical response.—N. H. Pronko.

PSYCHONEUROSES

1824. Arazi, S. (Mental Health Clinic, Ramat Hen) **Tipul nafshi biladim.** [Mental treatment with children.] *Dap. refuim*, 1962, 21, 131-138.—3 cases of emotionally disturbed children suffering from enuresis, stammering, and retardation in general development are broadly described in terms of their symptoms, personality, anamnesis, family, and the process of mental therapy. The way of handling problems is given and the neurotic dynamics analyzed. Description of the children's adjustment after 2 years is included. (English & French summaries)—H. Ormian.

1825. Chapman, A. H. (U. Kansas School Medicine) **Management of emotional disorders: A manual for physicians.** Philadelphia, Pa.: Lippincott, 1962. xvi, 259 p. \$8.50.—It is estimated that from 30% to 70% of the people seeking help from general practitioners in medicine have troubles which are not physical but psychiatric in nature. This book is a manual for such physicians and attempts to deal with most nonorganic problems confronting the general practitioner, to give at least partial answers to the most common of these problems, and to present concrete suggestions and specific advice. Special emphasis is placed on the development of physician-patient rapport conducive to catharsis and the emotional reeducation of the patient. A topical bibliography is included.—R. M. Frumkin.

1826. Dalma, Juan. **Tension entre madre e hija como causa morbigena en las neurosis juveniles.** [Tension between mother and daughter as a morbigenic cause of juvenile neurosis.] *Acta neuropsychiat. Argent.*, 1961, 7(3), 208-214.—The tension between mother and daughter has not received as much attention as the edipus complex, but the primitive maternal fixation often persists permanently in women. 5 cases of such conflict are related to their mythological types in the legends of Electra, Medea, and Myrrha.—W. W. Meissner.

1827. Evrard, E., & Bobon, J. **Pseudo-jargonaphasie de détente chez une psychonevrosée anxieuse en phase d'instabilité choréiforme.** [Pseudo-jargonaphasia during relaxation of an anxious psychoneurotic in phases of choreic instability.] *Acta neurol. psychiat. Belg.*, 1961, 61, 817-822.—"The authors report on the case of an anxious psychoneurotic woman who periodically shows a pseudo-jargon under the form of long strings of syllables without apparent significance. These obvious verbal plays are parallel to anxiety and to its degrees; they keep pace with the exaggerations of a motor instability of choreic type; their structure is elementary, regressive and childish. Under the mask of a play, they are in fact, a primitive modality of defence and relaxation."—V. Sanua.

1828. Guliamov, M. G. **Psikhicheskie narusheniia pri beshestve.** [Mental disturbances in hydrophobia.] Tashkent, USSR: USSR Ministry of Health State Medical Publishing House, 1959. 232 p.—The author reviews the literature on hydrophobia, introduces his own observations of 114 cases, discusses the incubation period and its significance for prophylaxis in adults and children, and suggests therapeutic measures on the basis of his own experience and utilization of Pavlovian theory.—I. D. London.

1829. Lazarus, Arnold A., & Abramovitz, Arnold. (U. Witwatersrand, Johannesburg, South Africa) **The use of "emotive imagery" in the treatment of children's phobias.** *J. ment. Sci.*, 1962, 108(453), 191-195.—Wolpe's reciprocal inhibition technique, involving systematic desensitization with emotion arousing situations presented to the child's imagination, was used with 7 successes out of 9 cases, and with mean number of treatments of 3.3.—W. L. Wilkins.

1830. Rosenfeld, Eva M. **Analyse einer angsthysterie, nach 21 Jahren kritisch betrachtet.** [Critical discussion of an analysis of an anxiety hysteria, 21 years afterwards.] *Psyche, Stuttgart*, 1962, 16(1), 34-49.—2 contrasting methods of analytic interpretation are described. For weak ego conditions the approach of Melanie Klein, a continuous 'decoding' of the patient's unconscious phantasies, is recommended. For strong ego conditions the conventional interpretation of transference in terms of memory repetition and repressed affects is indicated. Both kinds of interpretation are illustrated in the successful treatment of a severely hysterical young woman.—E. W. Eng.

1831. Sen, N. N. (All-India Inst. Mental Health, Bangalore) **An objective study of experimental neurosis: I. An historical and critical review.** *Psychol. Stud., Mysore*, 1961, 6(1), 10-29.—Investigations in experimental neurosis fall into 3 main groups: (a) the characteristics of behavioral abnormality observed in the experimental situation, (b) generalization and persistence of the symptoms after the cessation of the experimentally traumatic situation, and (c) the behavioral correlates or personality types associated with susceptibility of breakdown under experimental stress. A brief review of 47 studies is given with a comparative summary table. Bibliography of studies reviewed appears.—U. Pareek.

1832. Shargil, Avner. (Beilinson Hosp., Petah Tikva) **I-akhila kefiyatit.** [Compulsive anorexia.] *Dap. refuim*, 1962, 21, 185-187.—A case of compulsive anorexia and its treatment based on common sense

(without any psychotherapy) are described, and a follow-up during 2 years is given. Diagnosis and treatment must be conducted by the family physician and in his office. (English & French summaries)—*H. Ormian.*

PSYCHOSOMATICS

1833. **Annell, Anna-Lisa.** *Die Psychopathologie der entzündlichen Hirnschädigung.* [Psychopathology of inflammatory brain diseases in children.] *Acta paedopsychiat.*, 1962, 29, 7-21.—Symptoms have a double genesis: partly organic defects, often relatively slight, and sequential functional disturbances. The latter have often been ascribed to psychopathy or mental deficiency. After careful differential analysis, suitable medication often results in improvement of primary functional disorders. Briefing of family and teachers is essential. Lengthy convalescence is also responsible for the symptoms comparable to those of postencephalitic disorders.—*G. Rubin-Rabson.*

1834. **de Boer, Clemens.** *Zur Frage der psychosomatischen Spezifität unter besonderer Berücksichtigung des Asthma bronchiale.* [The question of psychosomatic specificity with special reference to bronchial asthma.] *Psyche, Stuttgart*, 1961, 15, 801-814.—A review of studies by an Amsterdam psychosomatic research group dating back to 1947, with an emphasis on bronchial asthma. The latter is viewed as primarily a defensive formation against excessive affect discharge in situations of feeling rejected, and secondarily as an anxiety equivalent antecedent to conscious anxiety.—*E. W. Eng.*

1835. **Finch, Stuart M., & Hess, John H.** (U. Michigan Medical School) *Ulcerative colitis in children.* *Amer. J. Psychiat.*, 1962, 118(9), 819-826.—“A brief review of the literature regarding idiopathic ulcerative colitis in both children and adults is presented. The results of our study of 17 children suffering from ulcerative colitis are given, including social, psychological, and psychiatric data. These findings are then discussed and conclusions regarding the work of other investigators and certain psychological formulations are drawn. A speculative hypothesis concerning the etiology of this disease is offered, and some therapeutic principles are suggested.”—*N. H. Pronko.*

1836. **Gittleson, N. L.** (Victoria U., Manchester, England) *Psychogenic headache and the localization of the ego.* *J. ment. Sci.*, 1962, 108, 47-52.—To test the hypothesis that psychogenic symptoms are sited at that part of the body which is felt by a patient to be most vital to him, 29 female and 16 male inpatients were interviewed, along with controls, about what part of the body they considered most important and whether they felt they had souls. Psychogenic headache patients felt that their heads were the most important parts of their bodies, while surgical controls preferred the heart. Presence or absence of depersonalization did not seem important to the main hypothesis.—*W. L. Wilkins.*

1837. **Gordon, Richard Edwards.** (Columbia U.) *Prevention of postpartum emotional difficulties.* *Dissert. Abstr.*, 1961, 21(12), 3873-3874.—*Abstract.*

1838. **Grunspun, Haim, & de Almeida Villar, Zelia.** (U. Catolica, Sao Paulo) *Conceito etiológico do distúrbio psicossomático na criança.* [An etiological concept of psychosomatic disturbance

in development.] *Acta neuropsychiat. Argent.*, 1961, 7(3), 180-181.—Psychosomatic disturbances in development are divided into 2 classes: defensive reactions manifested in disturbances of behavior in different phases of its evolution; and depressive reactions, which are manifested in disturbances of organ systems as such. 5 cases are presented.—*W. W. Meissner.*

1839. **Löfgren, L. B.** *A case of bronchial asthma with unusual dynamic factors, treated by psychotherapy and psycho-analysis.* *Int. J. Psycho-Anal.*, 1961, 42(4-5), 414-423.—*G. Elias.*

1840. **Margolis, M.** (Michigan State U.) *The mother-child relationship in bronchial asthma.* *J. abnorm. soc. Psychol.*, 1961, 63(2), 360-367.—The responses to the Blacky Test and an objective test of attitudes re child rearing—Parental Attitude Research Instrument (PARI), Schaefer & Bell (1955)—of mothers of children with asthma (A), were compared to those of children with rheumatic fever (RF), and a group being seen in out-patient clinic dealing with minor cuts and bruises (healthy controls, H). No differences were found on the PARI, and significance was found on only 2 cards of the Blacky. From these 2 cards, it was concluded that A mothers, as compared to the others, had a greater intensity of edipal conflict and were more inclined to be characterized as oral erotic.—*G. Frank.*

1841. **Meier, C. A.** *Psychosomatik in Jungscher Sicht.* [The Jungian view of psychosomatics.] *Psyche, Stuttgart*, 1962, 15, 625-638.—From the early work of Jung and his followers on the physiological correlates of “complex indicators” to his late emphasis on “synchronicity” there is persistent concern for the underlying unity in psychosomatic transactions. Evidences today for a mediating “third body” are suggestive, but seem to require the development of a “general theory of synchronicity” for their scientific application.—*E. W. Eng.*

1842. **Murphy, George E., Robins, Eli; Kuhn, Nobuko Obayashi, & Christensen, Roger F.** (Washington U., St. Louis) *Stress, sickness and psychiatric disorder in a “normal” population: A study of 101 young women.* *J. nerv. ment. Dis.*, 1962, 134(3), 228-236.—“Of 101 women interviewed shortly after a fullterm pregnancy with normal delivery, 26 were judged to be psychiatrically ill. With 4 exceptions they had not been seen by a psychiatrist.”—*N. H. Pronko.*

1843. **Rubbens, P.** *Psychosomatische visie op het onderzoek van verstandelijk en lichamelijk gehandicapten.* [Psychosomatic views about the study of mentally and physically handicapped people.] *Tijdschr. Stud. Beroepsorient.*, 1961, 8, 152-162.—Summary of the psychosomatic point of view about mental and physical defects.—*R. Piret.*

1844. **Sukiennik, S.** (Central Clinic “Zamenhof,” Tel Aviv) *Hashpaat matsavey dohak nafshi al mahalat hasukeret.* [Influence of mental tension on diabetes.] *Dap. refuim*, 1962, 21, 97-104.—8 cases were described. Mental tension causes overt diabetes only among latent diabetics; it is also likely to aggravate (temporarily, sometimes permanently) existing diabetes. Mental stress causes oversecretion of glucose. Treatment with insulin has to take into consideration the state of mental tension. (English & French summaries)—*H. Ormian.*

EPIDEMIOLOGY

1845. Balier, C. *Hygiène mentale en milieu rural*. [Mental health in the rural setting.] *Hyg. ment.*, 1961, 50(6), 370-392.—A psychiatrist reports the findings of a study of mental illness among farm workers in one of the more agricultural departments of France. Factors taken into consideration include economic impoverishment, lack of recreational opportunities, lack of stimulation and factors rewarding initiative, poor relations between farm workers and farm owners with a resulting dehumanization of the working situation, loss of the more capable workers to industry, and the steadily increasing mean age of the population. Consequences for mental health are discussed, and some suggestions for remedying the situation are offered.—*W. W. Meissner*.

1846. Davies, A. Michael, & Kaplan-Dinur, Atara. (Hebrew U., Hadassah Medical School) *Suicide in Israel: An epidemiological study*. *Int. J. soc. Psychiat.*, 1961/62, 8, 32-44.—The average suicide rate for the period 1949-58 was 10.5 per 100,000; the male-female ratio being 1.3:1. The rates increased with age. Highest rates were seen in the divorced and single and European immigrants; the lowest in married persons and native born. Contributing factors were believed to be the social disorganization attendant on mass immigration from many different countries, the background of oppression and suffering from which many of these people came, and the economic depression of the early years of the state with shortages of food, jobs, and housing.—*R. M. Frumkin*.

1847. Hsien, Rin, & Tsung-Yi Lin. (National Taiwan U. Hosp., Taipei) *Mental illness among Formosan aborigines as compared with the Chinese in Taiwan*. *J. ment. Sci.*, 1962, 108(453), 134-146.—Comparative psychiatric survey of 11,442 aborigines shows rates per thousand: psychosis, 3.9; neurosis, 0.8; mental deficiency, from 1.0 to 4.6, depending upon the tribe—with life-time prevalence rates of total mental disorders of 9.5 per thousand. Schizophrenia is much the same as in Chinese or Western culture and when untreated seems to clear up in less than 2 years. These figures are suggested as possible yardsticks for evaluation of modern treatment procedures and also as indication of the existence of therapeutic resources within the individual and the community.—*W. L. Wilkins*.

1848. Kessel, Neil, & Shepherd, Michael. (U. Edinburgh, Scotland) *Neurosis in hospital and general practice*. *J. ment. Sci.*, 1962, 108(453), 159-166.—Review of statistics of the British population registered under the National Health Service suggests that age and sex prevalence curves for psychiatric illnesses differ, especially for neuroses, from hospital data curves. There is a rise from youth to early maturity but no subsequent decline in prevalence, with women showing a plateau between the years 35-55. The traditional association of neurosis with young adult life is not supported by data derived from general medical practice. (42 ref.)—*W. L. Wilkins*.

1849. Lund, Frederick H. (Los Angeles State Coll.) *The cause of mental illness*. *Education*, 1962, 82, 432-437.—It is fairly evident that schizophrenia, psychiatry's biggest problem, has its origin

in disordered chemistry and stressed-induced defects of the regulatory mechanisms, central and peripheral, which govern the processes essential to internal equilibrium. The author discusses the stress syndrome, critical value of adrenal secretions, severity of stress symptoms, induced emotional stress, failure of stress mechanisms, sub-par autonomic functions, deficient brain function, other chemical imbalance, faculty detoxification, induced psychoses, and susceptibility to mental illness.—*S. M. Amatora*.

1850. Rabassini, A., Rigo, L. *Contributo al problema della genesi delle psicosi. A proposito di tre casi di psicosi familiare*. [Contribution to the genetic problem in psychosis: Aposops of three cases of family psychosis.] *Arch. Psicol. Neurol. Psychiat.*, 1962, 23(2), 88-107.—Interactions in 3 psychotic families are discussed from the viewpoint of prevention of schizophrenia.—*L. L'Abate*.

1851. Wortis, Joseph, & Wortis, Helen. (New York U.) *La relación entre deficientes condiciones socio-económicas y ciertas incapacidades psiquiátricas en la infancia*. [The relationship between deficient socioeconomic conditions and certain psychiatric disabilities in infancy.] *Acta neuropsiquiat. Argent.*, 1961, 7(3), 167-170.—3 reasons are advanced for the higher incidence of psychiatric disability in lower classes: (a) the complications and deficiencies of conception and birth which produce cerebral defects or damage are more frequent among the lower classes; (b) in a poor family, a child is exposed more often to poor nutrition, infections, accidents, etc. which may affect cerebral function and produce psychological disturbances; and (c) they suffer certain educational and social deprivations which tend to complicate and retard mental development.—*W. W. Meissner*.

EDUCATIONAL PSYCHOLOGY

1852. Astin, Alexander W. "Productivity" of undergraduate institutions. *Science*, 1962, 136 (3511), 129-135.—A new method for evaluating the "PhD productivity" of undergraduate institutions was applied to a sample of 265 institutions. It was found that a college's actual PhD output can be predicted relatively accurately from an "expected" output based on the sex, major fields, and intelligence level of its students. Public institutions were found to be significantly overproductive, and eastern men's colleges and universities were found to be significantly underproductive. Previous findings indicating that the faculty had a causative effect on productivity were not confirmed. These results suggest that PhD productivity may not be a sensitive measure of the effectiveness of undergraduate institutions.—*Journal abstracts*.

1853. Bigge, Morris L., & Hunt, Maurice P. (Fresno State Coll.) *Psychological foundations of education: An introduction to human development and learning*. New York: Harper, 1958. xiii, 530 p. \$7.50.—A beginning text in educational psychology, with a "nonelective . . . cognitive-field" approach, but some comparison with alternative systems. It includes sections on What is nature of human nature? How do human beings develop? How do human beings learn? How is psychology used in the classroom? Annotated bibliography with each chapter.—*E. B. Page*.

1854. Blumenfeld, Walter. (U. Nacional Mayor San Marcos, Peru) *Psicología del aprendizaje*. (2nd ed.) [Psychology of learning.] Lima, Peru: Univer. Nacional Mayor San Marcos, 1961. (Textos Universitarios No. 5) 240 p.—A textbook in learning written principally for education students and giving special attention to Gestalt principles. (99-item bibliogr.)—G. B. Strother.

1855. Creegan, Robert F. (State U. New York, Albany) *Dare we teach doubt?* *Sch. Soc.*, 1961, 89, 416-417.—Human beliefs may be said to maintain a steady state if learning about the factors which determine or encourage the proposal of solutions to problems is tantamount to learning to doubt that the proposals are definitive. Doubt arises with the quest for intellectual rigor, is based on reasoning, and is an integral part of any cognition as distinct from fancies and feelings. Some social and educational implications are discussed.—*Author abstract*.

1856. Crookston, B. B., & Blaesser, W. W. (U. Utah) *An approach to planned change in a college setting*. *Personnel guid. J.*, 1962, 40(7), 610-616.—A systematic method of diagramming situations in which organizational change is desired, is described. The rate of change will be strongly accelerated in the years ahead. Controlled or planned change will come about only by means of some type of systematic methodology. Force-field analysis is the core of an approach which has been found useful.—S. Kavruck.

1857. Gavrieli, Nahum. *Orhot hinukh*. [Methods of education.] Tel Aviv, Israel: Otsar Hamore, 1962. 440 p.—“The author speculates on the nature of the educational methods . . . and tries to understand the mental events connected with them.” Thus, all described methods of education are brought in connection first of all with corresponding mental phenomena. Then, educational-psychological problems are discussed: order, discipline, work, physical culture, play, habit formation, warning and threat, competition, praise and blame, recognition and strengthening of the child, educators and educands, the educator's personality, as well as specific educational problems.—H. Ormian.

1858. Golan, Shemuel. *Hahinukh hameshutaf*. [Common education (in the Kibbutz).] Merhaviah, Israel: Sofriyat Poalim, 1961. 398 p.—The 1st (posthumous) volume of Golan's collected writings including 38 papers on the following topics: principles and methods of common education, its factors, institutions, social structure, problems and solutions, status and achievements. “Common education” is treated as a new social phenomenon and analyzed from sociological, psychological, and educational aspects.—H. Ormian.

1859. Goldhammer, Keith, & Elam, Stanley. (Eds.) *Dissemination and implementation*. Bloomington, Ind.: Phi Delta Kappa, 1962. xi, 200 p. \$3.00.—6 papers presented at the 3rd annual Phi Delta Kappa Symposium on Educational Research are included along with discussions of the papers. Held at the University of Oregon, the conference theme was research dissemination and implementation. Papers given were: “Problems in the Use of Electronic Data Processing for the Storage and Availability of Research Data” by Allen Kent; “The Role of Private Philanthropy in the Dissemination and Im-

plementation of Educational Research” by John Gange; “The Role of School Study Councils and Local School Districts in the Dissemination and Implementation of Educational Research” by Ronald F. Campbell; “The Function of the United States Office of Education and the State Departments of Education in the Dissemination and Implementation of Educational Research” by David L. Clark; “The Use of the Inter-Institutional Agencies in the Dissemination and Implementation of Educational Research” by Paul B. Jacobson; and “Problems in the Use of Communication Media in the Dissemination and Implementation of Educational Research” by Andrew W. Halpin. Halpin emphasizes the dearth of good research in education as well as the reluctance to put into practice research findings that require tougher attitudes.—W. Coleman.

1860. Marshall, Helen R. (Drexel Inst. Technology) *Training adults to judge children's social acceptance*. *J. educ. Psychol.*, 1962, 53, 27-31.—To determine whether specific training improves the accuracy of adult judgments of children's social acceptance, 290 college students enrolled in a course requiring observation of a preschool group were divided into a control group, a group trained in factual knowledge, and a group exposed to a standard as well as to factual knowledge. Accuracy of judgment was tested 6 weeks after training. Results suggested that reduction as well as improvement in accuracy may result from training. Accuracy decreased when information as to earlier sociometric choices was provided, and increased after factual knowledge training. IQ was related to accuracy of judgment after training limited to factual knowledge, while personality characteristics influenced judgments only when no training was given.—*Journal abstract*.

1861. Murphy, Gardner. (Menninger Found.) *Freeing intelligence through teaching*. New York: Harper, 1961. 64 p. \$2.95.—This book is a revision of the 4th John Dewey Society lectureship presentation. The analysis of the teaching process traces relationships between rational and personal factors. The primordial psychic reality is said to involve both impulse and cognition. Love of subject matter and method are impossible without acceptance of the self and cathexis upon the self as seeker, knower, and lover of reality. In every relation between teacher and student a full transactionalism is demanded in harmony with the indicated hypotheses. A definite warning is given against theories to the effect that rationality can be seized by direct assault. While a crash program approach may attract attention by appealing to current public anxieties, more reasoned circuitous routes must be recommended by any systematic psychologist of personality.—R. E. Creegan.

1862. Rhodes, William C. (George Peabody Coll.) *Psychological techniques and theory applied to behavior modification*. *Except. Child.*, 1962, 28, 333-338.—With the increasing number of educationally focused programs for emotionally disturbed children, “there will probably be a growing demand for knowledge of behavior modification which might be applied in a classroom situation. . . . One resource which has not been fully utilized is the body of theory and laboratory findings of psychology, which does not require training in psychotherapy.” A review of the literature is presented.—J. Z. Elias.

1863. Van Dalen, Deobold B. (U. Pittsburgh) **Understanding educational research: An introduction.** New York: McGraw-Hill, 1962. xi, 432 p. \$6.95.—After inviting readers into the world of research and exploring the psychological and logical substrata of scientific investigations, the text gives them some insight into how scholars tackle investigations: how they locate problems; some of the methods, procedures, and tools that they employ; the general sequence of events that occurs during an investigation; the skills and knowledges required to undertake various types of studies; the library and its resources that are available, and the study habits and attitudes that are conducive to fruitful work. The objective of the book is to imbue students with a respect for the scientific spirit of inquiry and to acquaint them with problem solving techniques. To aid those who have a limited background in psychology, logic, and mathematics, the text orients the more sophisticated research matters to everyday experiences. The audience for which it is intended is for mature upperclassmen and graduate students pursuing their master's degree in education.—P. D. Leedy.

SCHOOL LEARNING

1864. Adams, Sydney. (Arlington, Va.) **How good is a prescribed mnemonic device in learning textbook content?** *J. educ. Res.*, 1962, 55(6), 267-271.—In a study of college students taking a course in educational psychology, the author found that a prescribed mnemonic device did not seem to help either rote or meaningful learning. On the other hand, the device did not appear to increase the time spent in learning. He reviews the literature of mnemonics and suggests that the techniques may be revived by those seeking unconventional approaches to problem solving.—F. Goldsmith.

1865. Anisfeld, M., & Lambert, W. E. (McGill U.) **Social and psychological variables in learning Hebrew.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 524-529.—Attitudes towards the social group employing the language, reason for studying the language, and intelligence were posited as parameters affecting the learning of a 2nd language. The investigation focused on Jewish 8th- and 9th-grade students learning Hebrew. The results indicated that ability and attitude facilitated learning.—G. Frank.

1866. Beach, L. R. (Whitworth Coll.) **Use of instructorless small groups in a social psychology course.** *Psychol. Rep.*, 1962, 10(1), 209-210.—"Experimental small groups of students working independently of formal class instruction in social psychology were superior to Ss in a conventional class on several measures. This teaching approach was thus more efficient in terms of instructor time and college facilities."—B. J. House.

1867. Beliaev, B. V. **Ocherki po psikhologii obuchenii inostrannykh iazykam.** [Essays on the psychology of teaching foreign languages.] Moscow, USSR: RSFSR Ministry of Education, 1959. 174 p.—This book on the psychology of teaching and learning foreign languages is intended for use by foreign language teachers and students of languages in pedagogical institutes.—I. D. London.

1868. Bosley, Howard E. **Class sizes and faculty-student ratios in American colleges.** *Educ. Rec.*, 1962, 43(2), 148-153.—A survey of published studies

on the effects of class size and the trends in a number of state colleges yields the following conclusions: (a) previous studies have exerted no observable influence on current practice; (b) most of the evidence from small-class versus large-class investigations is inconclusive, (c) total student load is more significant than either faculty-student ratios or average class size; and (d) personal characteristics of the instructor, the type of subject matter, the maturity, drive, and intelligence of the students, are factors which influence the effectiveness of large group instruction.—W. W. Meissner.

1869. Bruner, Jerome S. (Harvard U.) **Afrontement et defense.** [Threat and defense.] *J. Psychol. norm. pathol.*, 1961, 58(1), 33-56.—A discussion of the nature of school learning and factors interfering with scholastic achievement based on findings in children of normal intelligence with "learning blocks." Among the topics treated are: anxiety and drives, identification, preemptive metaphor, the double bind, and therapy.—M. L. Simmel.

1870. Coleman, J. C. **Learning method as a relevant subject variable in learning disorders.** *Percept. mot. Skills*, 1962, 14, 263-269.—Results on the Learning Methods Test for underachievers failed to disclose method of presentation superiority (visual, phonic, kinesthetic, or combination in learning new words). Visual and combination methods tended to be most efficient for some Ss.—W. H. Guertin.

1871. Durr, William K. (Michigan State U.) **Provisions for the gifted in relation to school size and system size at the elementary level.** *J. educ. Res.*, 1962, 55(4), 149-158.—The author surveyed 316 Michigan elementary schools and found: (a) Larger schools from larger systems are more likely to have planned programs for the gifted. (b) Small schools use partial segregation more often than large schools, while large schools use extracurricular activities more often than small schools. (c) Although a wide variety of identification procedures are used, schools in large systems use group intelligence tests to a greater extent than do schools in small systems. (d) Schools in small systems are more likely to feel hindered by inadequate finances in establishing programs, while schools in larger systems are more likely to say they do not need a planned program or that they have too few gifted to warrant it. Increasing interest in the gifted will probably lead to more planned programs.—F. Goldsmith.

1872. Goldbeck, Robert A., & Campbell, Vincent N. (American Inst. Research) **The effects of response mode and response difficulty on programmed learning.** *J. educ. Psychol.*, 1962, 53(3), 110-118.—2 experiments in junior high school classes compared overt, covert, and reading response modes. In Experiment I, 63 Ss completed a program of independent facts at 1 of 3 levels of difficulty. An analysis of covariance of test scores showed an interaction between response mode and difficulty ($p < .05$), the overt group performing below the other groups at the low difficulty level and above the other groups at the intermediate difficulty level. In Experiment II, 62 Ss completed a continuous discourse program on light. The 3 response modes plus a 4th option mode were used in a simple randomized design. The reading group surpassed the other groups on both immediate (NS) and 10-week retention ($p < .05$) tests.

In both experiments the reading groups learned most per time spent ($p < .01$).—*Journal abstract*.

1873. Harper, Robert S. (Knox Coll.) **Variability, conformity, and teaching.** *Teachers Coll. Rec.*, 1962, 63(8), 642-648.—Adapted from presidential address to Division on Teaching of Psychology, American Psychological Association, September, 1961. The author urges more variability or novelty in teaching procedures.—H. K. Moore.

1874. Huaux, Jacques. **Le transfert de l'entraînement en pédagogie expérimentale.** [Transfer of training in experimental pedagogy.] Louvain, Belgium: Éditions Nauwelaerts, 1961. 94 p. 110 FB.—A synthesis of research of a positive nature relating to the transfer of training from one teaching situation to another. Besides detailing the principal results obtained in studies of this kind, a comprehensive review of the existing theories is included. Finally, the need for more, and better studies dealing with specific aspects of realistic classroom situations is pointed up. (80 ref.).—G. H. Mowbray.

1875. James, Newton E. (U. Arizona) **Personal preference for method as a factor in learning.** *J. educ. Psychol.*, 1962, 53, 43-47.—Do individuals who learn material utilizing a preferred method actually learn better than those utilizing a method other than their choice? A total of 503 basic airmen at Lackland Air Force Base were grouped according to expressed preference between reading and lecture as modes of receiving elementary Air Force technical training prose. Each group was then subdivided randomly, one segment being given learning material utilizing the mode of choice with the other segment utilizing a different mode. No differences were found on posttests between Ss receiving material in mode of choice and those receiving material in mode unlike that chosen.—*Journal abstract*.

1876. Jensen, Arthur R. (U. California) **Spelling errors and the serial-position effect.** *J. educ. Psychol.*, 1962, 53(3), 105-109.—The relative frequencies of spelling errors as a function of letter position have been examined for 7-, 9-, and 11-letter words selected at random from the Thorndike-Lorge word list. These were administered to 150 8th graders, and 89 juniors college freshmen, respectively. The distribution of errors according to letter position was found to closely approximate the classical skewed, bow-shaped, serial-position curve for errors generally found in serial rote learning. Other features in common between spelling and serial learning were discussed. It is suggested that a theory of serial learning and of the serial-position effect may be germane to the psychology of spelling.—*Journal abstract*.

1877. Menchinskaja, N. A. (Ed.) **Primenenie znaniĭ v uchebnoi praktike shkol'nikov.** [The application of knowledge in the written work of school children.] Moscow, USSR: RSFSR Academy Pedagogical Sciences, 1961. 375 p.—The essays included in this book report on the results of "psychological investigations" of the application of classroom-learned theory to textbook problems in arithmetic, geometry, physics, botany, and machine practice and repair.—I. D. London.

1878. Reichenberg-Hackett, W. (Duke U.) **Practices, attitudes and values in nursery group education.** *Psychol. Rep.*, 1962, 10(1), 151-172.—

Detailed descriptions were recorded by teams of observers of behavior of teachers in 11 nursery school classes. Records were analyzed according to categories described as teacher's approach (communicative or noncommunicative), motivating techniques, activities, lessons, and values. Quantitative and qualitative comparisons were made of the various classes, and the effect of teacher personality on the class was discussed.—B. J. House.

1879. Steiner, Elise. **The nursery school idea.** *Develpm. Med. child Neurol.*, 1962, 4(2), 184-194.—The historical background is sketched briefly, especially the increasing awareness of the importance of mental health factors following the last war and the investigations of Anna Freud, Susan Isaacs, John Bowlby, et al. Included in the consideration of disiderata are the provisions of creative materials, "the scope given for physical and intellectual 'stretching' by materials which stimulate the children to investigate . . . experiment and adventure, the stimulus of permissive relationship with adults, and the growing importance of language in the child's life at this stage."—T. E. Newland.

1880. Torrance, E. P., & Myers, R. E. (U. Minnesota) **Teaching gifted elementary pupils research concepts and skills.** *Gifted child Quart.*, 1962, 6(1), 1-6.—A 3 year old program for the teaching of research knowledges, skills, and attitudes to gifted elementary school children is described. The "What's in the Box" game was used for teaching hypothesis making. "How did you grow" exercises were used in teaching historical research. "Ask and guess test" was used in the teaching of testing of significance. Randomization and quantification were also discussed. Students executed their own experiments and wrote reports containing statements of purpose, procedure, results, discussion, and conclusions. On the basis of written responses to a test on research facts, the authors concluded that the children grasped basic research concepts.—N. M. Chansky.

1881. Traxler, Arthur E. (Ed.) **Improving the efficiency and quality of learning.** Washington, D. C.: American Council on Education, 1962. viii, 175 p. \$2.50.—"A report of the Twenty-sixth Educational Conference, New York City, October 26-27, 1961, held under the auspices of the Educational Records Bureau and the American Council on Education." Included are a review by the editor; 15 papers on programed instruction, teaching devices, testing, and progress reports (on revised curricula in mathematics, science, languages, etc.); 1 symposium on reading; and the report of the 27th Annual Meeting of the Educational Records Bureau.—M. L. Kelly.

1882. Tsitsishvili, N. E. (Uznadze Inst. Psychology, Tbilisi, USSR) **Zapis' chisla v raznykh sistemakh schisleniia v V klasse srednei shkoly.** [Number-writing in different systems of counting in the fifth grade of the secondary school.] *Soobshch. Akad. Nauk Gruz. SSR*, 1962, 28(2), 249-257.—Experimental teaching of different number systems to 11-12-yr.-old pupils shows that it is useful to do this instead of concentrating on the decimal system as the only system of number formation. Furthermore, it is recommended that the latter system be taught deductively so as not to interfere with subsequent generalization to other systems of number formation.—I. D. London.

INSTRUCTIONAL AIDS

1883. Archangel'skiĭ, S. N., Endovitskaia, T. V., & Neverovich, I. A. Z. *Nagliadnye posobiia i opyty v kurse psikhologii*. [Visual aids and experiments in the psychology course.] Moscow, USSR: Uchpedgiz, 1958. 104 p.—This manual of visual aids and experiments for use in the introductory course in psychology is intended for instructors in pedagogical institutes.—I. D. London.

1884. Carter, Launor F. (System Development Corp., Santa Monica) *Automated instruction*. *Amer. Psychologist*, 1961, 16, 705-710.—"One of the major differences between the SDC teaching machine and others is the great flexibility that is achieved by using a small, digital computer as the control mechanism for the teaching." An example to illustrate its characteristics is presented. The "most important problem in the teaching machine area is not the design of the machine itself but rather the design of good instructional material. It is felt that not enough research has been done to demonstrate the way in which instructional materials should best be prepared; similarly, there has not been enough research to demonstrate the conditions under which this type of automated education can yield good results."—S. J. Lachman.

1885. Cassel, R. N., & Ullom, W. L. (Lompoc Unified Schools, Calif.) *A preliminary evaluation of programmed instruction with students of high ability*. *Psychol. Rep.*, 1962, 10(1), 223-228.—"A self-instructional program on computer mathematics, presented by a teaching machine [AutoTutor Mark II], was administered to 32 9th- and 12th-grade students of high ability at the Lompoc High School. A highly significant amount of learning as measured by gains on a criterion test, resulted." Student attitudes were favorable.—B. J. House.

1886. Deutschmann, Paul J., Barrow, Lionel C., Jr., & McMillan, Anita. (Michigan State U.) *The efficiency of different modes of communication*. *Audiovis. Commun. Rev.*, 1962, 10(3), 176-178.—"Efficiency in learning was defined as the discrepancy between the amount of relevant information and the amount of irrelevant information a student learned." 74 Ss in an engineering course were tested immediately following 4 "laboratory" sessions conducted under different conditions. An hypothesized rank order of efficiency of conditions was confirmed. TV film communication was most efficient followed by film only, laboratory plus film, and natural laboratory.—R. E. Schutz.

1887. Edfeldt, Åke W. (Stockholm U.) *Automatic teaching: Principiella synpunkter*. [Automatic teaching: Fundamental points of view.] *Nord. Psykol.*, 1962, 14(1), 6-20.—A review of the early work in the field of automated teaching and the recent rapid development initiated along 2 different lines by Skinner and Crowder, respectively. A comparison of Skinner's and Crowder's different types of methods and aids suggests that a combined method produces the best learning situation. The advantages of automated teaching at certain junctures in a curriculum are stressed.—L. Goldberger.

1888. Filby, Yasuko. *Teaching machines: A review of theory and research*. *Nord. Psykol.*, 1961, 13(5), 209-256.—The literature on teaching machines is critically reviewed under the following rubrics:

empirical principles from learning theories applicable to automated teaching (positive reinforcement, law of effect, the reinforcing event, conditions for maximal efficiency of positive reinforcement, individual differences), advantages of automated teaching, approaches to automated teaching (Skinner, Pressey, Crowder, Homme and Glaser), survey of the experimental literature (feedback, gradual progression, role of errors in learning, branching or fixed sequence, mode of response, mechanized vs. nonmechanized presentation, pacing). The author concludes with suggestions for future research. (60 ref.)—L. Goldberger.

1889. Gagne, R. M., & Dick, W. (Princeton U.) *Learning measures in a self-instructional program in solving equations*. *Psychol. Rep.*, 1962, 10(1), 131-146.—A detailed description is presented of learning, retention, and transfer measures obtained from a teaching machine program in solving equations administered to 52 7th-grade mathematics students. The program, which made use of a "successive approximations" method, was presented as a set of booklets. The study also investigated the effect of verbalization of a concept on performance. Student reactions to the program were sampled by a questionnaire.—B. J. House.

1890. Geis, George L. (Hamilton Coll.) *Some considerations in the evaluation of programs*. *Audiovis. Commun. Rev.*, 1962, 10(1), 64-69.—Deficiencies in error count and time scores as criteria for evaluating programmed learning are discussed. Evaluation should focus on measuring terminal behavior and identifying the reinforcements in a program.—R. E. Schutz.

1891. Gilpin, John. (Earlham Coll.) *Design and evaluation of instructional systems*. *Audiovis. Commun. Rev.*, 1962, 10(2), 75-84.—A consideration of means of securing comparability of programmed learning data. This can be achieved by appropriately defining and specifying the objectives of instruction (instructional task), designing a means of accomplishing the task (instructional system), and developing tests that will ascertain whether or not students accomplish the task. Measures of time and money can then be used as appropriate dependent variables.—R. E. Schutz.

1892. Harclerod, Fred. (Alameda County State Coll., Hayward, Calif.) *Theoretical formulations in audiovisual communications*. *Rev. educ. Res.*, 1962, 32(2), 119-126.—"In the past 6 years major changes and additions took place in advancement of audiovisual theory. A few key summaries and articles have been selected to document the enormity of the changes and the radical shifts in emphasis. Impetus for the changes came from the determination of Congress that public education has become a first-line item in national defense. Continuance of this concern appears probable. The next 3 to 5 years may well see an even greater emphasis on audiovisual research and an even closer relationship with psychologists and their work in developing a theory of human learning." (33 ref.)—F. Goldsmith.

1893. Horrocks, J. E. (Ohio State U.) *Case study tests in human growth and development*. Columbus, O.: C. E. Merrill, 1960. (5 sets, \$4.80 each)—5 tests for use in undergraduate and graduate courses and for inservice programs. The 1st test, A Test of Knowledge of Facts and Principles: Ado-

lescent Development, may be used as a pre- or end-test; its reliability is $.91 \pm .017$. The other 4 are case study tests to assess a student's ability in diagnosis and in choosing remedial procedures; their reliabilities range from .73 to .79.—C. T. Morgan.

1894. Kabanova-Meller, E. N. (Inst. Psychology, APN RSFSR, Moscow, USSR) *O probleme konkretnogo i abstraknogo v umstvennoi deyatel'nosti uchashchikhsya*. [On the problem of the concrete and abstract in mental activity of pupils.] *Vop. Psikhol.*, 1961, 7(6), 173-178.—This is a review of foreign (mainly Western) psychological investigations of the title topic. The work of the Gestalt psychologists and others working in this tradition is briefly described, emphasizing the concept of reorganization. For example, Hartman's idea that processes of abstraction and generalization occur during perception is discussed. Work of others on the use of visual aids and on how material is abstracted from visual aids is summarized. This part of the review is extended to include studies in which the relative concreteness of the stimulus materials affected performance (mainly problem solving studies). Foreign as well as Soviet studies of the problem of the abstract and concrete are criticized for confounding with irrelevant variables.—H. Pick.

1895. Keislar, Evan R., & McNeil, John D. (U. California, Los Angeles) *A comparison of two response modes in an auto-instructional program with children in the primary grades*. *J. educ. Psychol.*, 1962, 53(3), 127-131.—To test the value of overt responding with young children, a total of 198 primary grade children divided into 2 matched groups were individually taught, by a teaching machine, a 3-week unit in physical science. The overt response group was required to respond to each frame by selecting the correct answer before the program would advance. The nonovert response group merely observed the entire program as it was automatically presented. Both groups learned significantly more than an uninstructed control group, but the difference between nonovert and overt responders was not significant.—*Journal abstract*.

1896. Ketcham, Carl H., & Heath, Robert W. (U. Arizona) *Teaching effectiveness of sound with pictures that do not embody the material being taught*. *Audiovis. Commun. Rev.*, 1962, 10(2), 89-93.—A brief taped narration dealing with a fictional holdup-murder followed by arrest and execution was presented to groups of graduate students with various sets of 35mm black-and-white slides. Mean scores on a 30-item multiple choice criterion test were significantly different at the .01 level with groups ranked from high to low as follows: sound plus relevant pictures, sound only, sound plus pictures of geometric forms, and sound plus irrelevant pictures.—R. E. Schutz.

1897. Klaus, David J. (American Inst. Research, Pittsburgh) *The art of auto-instructional programming*. *Audiovis. Commun. Rev.*, 1961, 9(2), 131-142.—A discussion of what programmed instruction is and the variety of situations in which it is being used is followed by an explanation of the steps and rules to be followed in good programming.—E. L. Borrowman.

1898. Kopstein, Felix Friedrich. (U. Illinois) *An experimental exploration of the interaction be-*

tween teaching and learning behavior. *Dissert. Abstr.*, 1961, 21(12), 3861-3862.—*Abstract*.

1899. Krumboltz, John D., & Weisman, Ronald G. (Stanford U.) *The effect of overt versus covert responding to programmed instruction on immediate and delayed retention*. *J. educ. Psychol.*, 1962, 53, 89-92.—To test the effect of overt vs. covert responding in programmed instruction, 54 undergraduates in educational psychology were randomly assigned to 4 groups: a group who wrote down each response, a group who "mentally composed" each response, a group who read the program in which the blanks were already filled, and a control group who wrote their answers to a completely different program of about the same length. A 50-item test was administered following the study period, and an alternate form 2 weeks later. The 3 response mode groups did not differ significantly on the 1st test. However, on the delayed test the written response group scored significantly higher than the other 2 groups. The control group scored significantly lower on both tests. Thus, overt responding appears to increase delayed retention.—*Journal abstract*.

1900. McNeil, John. (U. California) *An experimental effort to improve instruction through visual feedback*. *J. educ. Res.*, 1962, 55(6), 283-285.—A 5-week performance of 10 student teachers, divided into 3 groups each under a different condition, was evaluated by 307 pupils. Teachers in the experimental group received visual feedback which indicated their teaching performance. Teachers in one control group systematically asked questions to obtain information as to whether or not pupils understood, but had no special channel for receiving the information. Teachers in a 3rd group taught without experimental arrangements. Differences among the groups in terms of performance change of student teachers were not significant. Therefore, the author believes that (a) feedback messages must be detailed and sophisticated and (b) the teacher must know how to change her procedures if she is to meet student needs.—F. Goldsmith.

1901. McNeil, John D., & Keislar, Evan R. (U. California, Los Angeles) *Questions versus statements as stimuli to children's learning*. *Audiovis. Commun. Rev.*, 1962, 10(2), 85-88.—A test of the hypothesis that programmed learning presented in question form requiring no overt response results in greater learning and preference for the topic taught than the same program arranged as a series of statements. 134 2nd and 3rd grade Ss were assigned to 3 matched groups. One group was exposed to a 432-frame program on molecular theory in question form. Another was exposed to the same material in statement form, and a 3rd control group was exposed to an entirely different program. No significant differences in either achievement or preference posttests were found between the 2 experimental groups, although both achieved significantly more than the control group.—R. E. Schutz.

1902. Meierhenry, Wesley C. (Ed.) (U. Nebraska) *Learning theory and AV utilization*. *Audiovis. Commun. Rev.*, 1961, 9(5, Suppl. No. 4), 88 p.—This issue of the journal is devoted to the contributions of various areas of psychology to audiovisual education. Abraham S. Luchins discusses the implications of Gestalt psychology; Howard H.

Kendler, those of stimulus-response psychology; and Leo Postman, those of human learning. Robert Glaser discusses "Learning and the Technology of Instruction," and Frederick J. McDonald writes on "Motivation and the Communication Process." James Deese summarizes and discusses possible applications.—*E. L. Borrowman.*

1903. Minter, Philip C., Albert, Fritz A., & Powers, Richard D. (U. Wisconsin) Does presentation method influence film learning? *Audiovis. Commun. Rev.*, 1961, 9(4), 195-200.—Among 185 girls in 7th-grade sewing classes the opportunity for discussion and note taking between sections of a film "promoted significantly more learning than did" written questions spliced into the film, rest pauses during the showing of the film, or "continuous showing without comment or questions." This effect showed only for the higher-intelligence and initially-uninterested groups. There were no differences between methods for the lower-intelligence or prior-interest groups.—*E. L. Borrowman.*

1904. Pask, G., & Lewis, B. N. An adaptive automation for teaching small groups. *Percept. mot. Skills*, 1962, 14, 183-188.—In this paper it was first argued that the automated teaching of small groups requires, for most skills, a rather special kind of adaptive automation which can organize the group members by manipulating their channels of communication. An example of such an automation was then described and its potentialities pointed out.—*W. H. Guerin.*

1905. Patel, A. S., & Parlikar, R. K. (Maharaja Sayajirao U., Baroda) Comprehension of learning material as a function of aural, visual and pictorial presentation of material. *MANAS*, Delhi, 1961, 8, 15-19.—Boys scored better in auditory (A) in a single method of presentation and visual plus auditory (VA) in a combined method of presentation, while girls scored better in visual (V) in a single method of presentation and visual plus auditory plus pictorial (VAP) in a combined method of presentation. There were significant differences among 3 groups of intelligence.—*U. Pareek.*

1906. Popham, W. James. (San Francisco State Coll.) Tape recorded lectures in the college classroom. *Audiovis. Commun. Rev.*, 1961, 9(2), 109-118.—"A research methods class was divided into two sections which were equated on the basis of scholastic aptitude as well as scores on two different types of achievement pre-tests. The control section was taught by a standard lecture-discussion approach while the experimental section was taught primarily by a series of 34 half-hour taped lectures. A brief discussion period permitted the instructor (in person) to answer questions regarding the taped lectures. On the basis of group performances on several criterion measures, no statistically significant differences . . . were found."—*E. L. Borrowman.*

1907. Popham, W. James. (San Francisco State Coll.) Tape recorded lectures in the college classroom. II. *Audiovis. Commun. Rev.*, 1962, 10(2), 94-101.—36 students enrolled in a pre-service teacher education course were assigned to 2 sections in matched pairs. A "conventionally-taught section was instructed by a standard lecture-discussion approach. The tape-taught section listened to hour-long taped lectures and discussed the content" with a student

discussion leader. No significant differences between the group performance of the 2 sections were found on several criterion measures at the end of the semester.—*R. E. Schutz.*

1908. Rigney, Joseph W., & Fry, Edward B. (Electronics Personnel Research Group, U. Southern California) Current teaching-machine programs and programming techniques. *Audiovis. Commun. Rev.*, 1961, 9(3; Suppl. No. 3), 122 p.—This issue is given over to an interpretative and descriptive report on programs and programming. Common terminology of the field is defined, programming rules and techniques are summarized, and the types of programs now available are described. Part II includes samples of 81 programs in areas ranging from biology and bridge to spelling and statistics.—*E. L. Borrowman.*

1909. Roe, Arnold. (U. California, Los Angeles) Automated teaching methods using linear programs. *J. appl. Psychol.*, 1962, 46, 198-201.—186 freshman engineering students studied elementary probability by different teaching methods. Multiple choice teaching machines, free-response teaching machines in individual booths, free-response teaching machines in a classroom, programed textbooks requiring overt responses and providing correct answers, programed textbooks requiring no overt responses, "programed" lecturers, and standard lecturers were compared. No significant differences were observed between the performance of the students learning by any of the programed machine, programed textbook, or programed lecturer methods: all of the programed methods were significantly better than the standard lecturer.—*Journal abstract.*

1910. Roe, K. Vlachouli; Case, H. W., & Roe, A. (U. California) Scrambled versus ordered sequence in autoinstructional programs. *J. educ. Psychol.*, 1962, 53, 101-104.—A 71-item autoinstructional program on elementary probability was presented in scrambled and in properly ordered sequence, respectively, to 2 groups—each of 18 psychology students classified according to prior mathematical ability. Students proceeded once through the linear program at their own pace and were given a test immediately after. The sequence of items had no significant effect on (a) time required for learning, (b) error score during learning, (c) criterion test score, and (d) time required for criterion test. This suggests that rather than being an absolute requirement, the careful sequencing of items in an autoinstructional program may be a function of such variables as length of program, information content of items, and individual learner differences.—*Journal abstract.*

1911. Silvern, Leonard C. (Hughes Aircraft Co., Culver City, Calif.) Teaching machine technology: The state of the art. *Audiovis. Commun. Rev.*, 1962, 10(3), 204-217.—A discussion on the history and current status of machine instruction viewed as a system with special attention to its relevance for industrial training.—*R. E. Schutz.*

1912. Smith, W., & Moore, J. W. (Bucknell U.) Size-of-step and achievement in programed spelling. *Psychol. Rep.*, 1962, 10(1), 287-294.—"Ss ($n = 96$) learned spelling words by one of six methods in which size-of-step and cues were varied. Analysis of errors showed that effects of treatments

were not distinguishable, but the large-step method saved time."—*B. J. House.*

1913. **Wesley, Frank.** (Portland State Coll.) **Silents please.** *Audiovis. Commun. Rev.*, 1962, 10 (2), 102-105.—4 groups of 40 psychology students viewed the film, "The Baby's Day at 12 Weeks," under one of the following conditions: once without sound, once with sound, first without sound and then with sound, and first with and then without sound. From a Chi-square analysis of an observation checklist completed by the Ss it is concluded "that the auditory aspects of the film . . . superseded the visual ones. . . . The viewer when presented 'equivocal' material gives precedence to audition. By thus accepting and remembering only the narrator's point of view, he may narrow his own judgment and inquisitiveness."—*R. E. Schutz.*

ATTITUDES & ADJUSTMENT

1914. **Agarwal, Vimla.** **Factors in ways of life.** *Psychol. Stud., Mysore*, 1962, 7(1), 52-63.—156 students responded to a scaled questionnaire on 9 ways of life. 4 main factors were extracted through the centroid method of factor analysis. The results show that values are multidimensional. The 4 common basic variables revealed are: achieving end by any means, self-restraint, purity of thought, speech and action, and salvation through selfless action. The value span of the Indian student is enclosed by dimensions of social restraint, detachment, and activity. "His preference for activity indicates his appreciation to change." The scale appears in appendix.—*U. Pareek.*

1915. **Becker, Selwyn W., & Siegel, Sidney.** (U. Chicago) **Utility and level of aspiration.** *Amer. J. Psychol.*, 1962, 75(1), 115-120.—"Evidence is presented that a person's level of aspiration can be measured by obtaining a scale of utility of his goals. A conceptual scheme for ranking all possible higher ordered metric scales in terms of a definition of level of aspiration is detailed and tested by predicting changes in the level of aspiration. Utility of grades was obtained before and after a mid-term examination and changes in the level of aspiration were predicted."—*R. H. Waters.*

1916. **Bozhovich, L. I., & Blagonadzhina, L. V.** (Eds.) **Voprosy psikhologii lichnosti shkol'nika.** [Problems in the psychology of the school child's personality.] Moscow, USSR: RSFSR Academy Pedagogical Sciences, 1961. 407 p.—Several studies are presented on various aspects of character and attitudinal development in children and adolescents within the context of the Soviet school.—*I. D. London.*

1917. **Cowell, Charles C., & Ismail, A. H.** (Purdue U.) **Relationships between selected social and physical factors.** *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(1), 40-43.—Interrelationships between personal distance (degree of personal acceptance), motor fitness and athletic aptitude were studied using 83 boys in the 10-12-year-old age range. The relationship of athletic aptitude to leadership was studied in the same group. Another group of 75 boys of junior high school age was used to study the interrelationships between social adjustment, motor fitness, and athletic aptitude. In still another group of 45 freshmen university football squad members, the relation of personal distance scores to foot-

ball ability, as judged on a man-to-man rating basis on 9 items, was studied. All relationships were found to be positive, moderate, and significant at the 1% level of confidence.—*Journal abstract.*

1918. **Fleming, Elyse S., & Weintraub, Samuel.** (Western Reserve U.) **Attitudinal rigidity as a measure of creativity in gifted children.** *J. educ. Psychol.*, 1962, 53, 81-85.—The performance of 68 academically talented elementary school children on a battery of verbal and nonverbal creativity tests was correlated with performance on a paper and pencil test purporting to measure attitudinal rigidity. A moderate negative relationship ($r = -.41$) was found to exist between rigidity and verbal creativity only. Investigation of the relationship of chronological age, intelligence, and sex indicated that while neither sex nor intelligence were significant factors, chronological age appeared to be related to verbal creativity production. Refinement of the rigidity measure seems indicated as an administratively feasible technique for the rough screening of verbally creative children.—*Journal abstract.*

1919. **Freer, James Joseph.** (Wayne State U.) **The effects of scholastic success and failure on the relationship among self-concept, ideal self, and level of aspiration.** *Dissert. Abstr.*, 1961, 22(1), 347.—*Abstract.*

1920. **Gildea, Margaret C. L., Glidewell, John C., & Kantor, Mildred B.** (Washington U. Medical School, St. Louis) **Maternal attitudes and general adjustment in school children.** In John C. Glidewell (Ed.), *Parental attitudes and child behavior* (see 37: 913). Pp. 42-89.—"The studies showed significant relationships between social class of the families and the attitudes of the mothers toward child rearing. Upper class mothers most often felt confident of their methods, saw the child as in need of limited parental control, felt responsible for the behavior of their children, and potent to influence the outcome of problems of child rearing. Middle class mothers were the in between group. . . . The lower class mothers felt least confident of their methods. . . . The studies showed little relationship between specific attitudes and adjustment in school children, but significant relationships between patterns of attitude combinations and adjustment."—*W. J. Meyer.*

1921. **Gordon, Leonard V., & Mensh, Ivan N.** (USN Personnel Research Activity, San Diego, Calif.) **Values of medical students at different levels of training.** *J. educ. Psychol.*, 1962, 53, 48-51.—A cross-sectional study of changing values of medical school students was performed by administering a values test, the Survey of Interpersonal Values, to all members of the 1st through 4th year classes in a large medical school. A predicted decrease in Benevolence, from the 1st through the 4th year, was found. Significant increases in Support, Recognition, and Independence and a significant decrease in Conformity were also noted. The present findings have implications for the practice of applying personality data obtained on occupational groups to high school or college counselees.—*Journal abstract.*

1922. **Grinker, Roy R., Sr., Grinker, Roy R., Jr., & Timberlake, John.** (Michael Reese Hosp., Chicago) **"Mentally healthy" young males (homoclitics): A study.** *Arch. gen. Psychiat.*, 1962, 6(6), 405-453.—65 "normal" students of George William

College were interviewed, and 80 replied to a 700-item questionnaire. Results indicated that these lower and lower middle class Ss from all over the United States and Canada with IQ range 88-133 came from warm, loving, consistent, limit-setting, slightly compulsive parents. Ss deal with anxiety by physical activity or withdrawal. Goals are to be and do good, help others, and be liked. Ss lack ambition to improve upon their parents' status and/or income. Ss are neither creative nor introspective. Grouping into very well, fairly well, and marginally adjusted evidences significant factors. Psychiatric, psychologic, psychoanalytic, and sociologic literature on the concept of mental health. (59 ref.)—*L. W. Brandt*.

1923. Gruen, Walter. (Beth Israel Hosp., Boston) **Attitudes of German exchange students during a year in the United States.** *Publ. opin. Quart.*, 1959, 23(1), 43-54.—25 German exchange students in labor relations were interviewed at the beginning and end of a year's stay at a large American university. Ages ranged from 21 to 25; 22 students were males. Interviews covered social, political, and economic areas, in a relatively unstructured fashion. Responses were judged on 74 attitudinal dimensions with a 7-point scale, then narrowed to 56 after refinement. From cluster analysis comparing pre- and postmeans "The four changes observed were toward a more intimate acquaintance with some United States social conditions, a view of the American as less carefree than had been thought, perception of more class distinctions in our society, and an even greater rejection of family life in the United States."—*E. P. Hollander*.

1924. Haring, Norris G., & Phillips, E. Lakin. **Educating emotionally disturbed children.** New York: McGraw-Hill, 1962. xvii, 322 p. \$6.50.—This volume describes "how a structured program in the classroom can be implemented to meet the requirements of the emotionally disturbed child" at reasonable cost and without requiring additional, full-time professional mental health personnel. A selected review of past educational practices and recent uses of classroom structure is followed by a detailed description of the experimental project and its methods—including selection criteria for staff and students, materials for special classes, use of consultants for discussing problem situations, and generalizing results obtained to the education of less disturbed children. Parent group meeting protocols, teachers' observations, and a rating scale are appended. (51 ref.)—*H. P. David*.

1925. Ivaschenko, F. I. (Pedagogical Inst., Stavropol', USSR) **Usloviya formirovaniya u shkol'nikov polozhitel'nogo otnosheniya k sel'skokhozyaistvennomu trudu.** [Conditions for the formation in school children of a positive attitude towards agricultural work.] *Vop. Psikh.*, 1961, 7(6), 27-36.—Notwithstanding the contribution the school children are making to agricultural production, their attitude toward this work isn't always good. Analysis of conversations and written topical assignments suggest that the best attitude comes when the students understand the larger significance of the work. On the other hand, not being able to see tangible results of their efforts, the students may not develop positive attitudes. They further want to put their practical training into practice and don't appreciate not being given the opportunity to use their skills. Other important factors include the variety

of work performed and the method of payment. Payment seemed most conducive to favorable attitudes toward work when it was made to the group and not to the individual.—*H. Pick*.

1926. Kersh, Bert Y. (Teaching Research, Oregon State System of Higher Education, Monmouth) **The motivating effect of learning by directed discovery.** *J. educ. Psychol.*, 1962, 53, 65-71.—High school students were taught 2 novel rules of addition by a programmed booklet procedure. Subsequently, $\frac{1}{2}$ of the 90 Ss were given individual guidance in discovering the explanation for the rules ("guided discovery"), $\frac{1}{4}$ were taught the explanation by a programmed booklet ("directed learning"), and the remaining $\frac{1}{4}$ were given no further instruction ("rote learning"). A questionnaire and a test of recall and transfer given 3 days, 2 weeks, and 6 weeks later favored the Rote Learning and Guided Discovery groups. The questionnaire indicated that the Guided Discovery group practiced the rules during the time interval between the learning and test period more than Ss in other groups (chi square, $p = .05$). The data support the hypothesis that self-discovery motivates the S to practice more and thus to remember and transfer more than he might if taught directly.—*Journal abstract*.

1927. Lane, W. Clayton. (Stanford U.) **The lower-class girl in college: A study of Stanford freshman women.** *Dissert. Abstr.*, 1961, 21(11), 3540.—*Abstract*.

1928. Lighthall, Fredrick F. (U. Chicago) **Some theoretical and measurement problems associated with changes in anxiety: Comments on "Anxiety in Connection with School Performance. Part III."** *Pedag. Forsch.*, 1961, No. 4, 263-276.—(See 36: 1HC77R) A stable and highly predictable position effect, consisting of an "improved" score upon 2nd testing (in test-retest or counterbalanced designs), has been found in several studies using anxiety scales with children. 2 hypotheses have been proposed to account for this effect: (a) defensive mobilization and (b) anxiety dissipation. The latter hypothesis appears untenable, while the former is shown to account for a wide range of disparate findings.—*L. Goldberger*.

1929. Liversidge, W. (U. Leicester) **Life chances.** *Sociol. Rev.*, 1962, 10(1), 17-34.—616 children from selected grammar and modern schools were sampled to determine the relative influence of educational background and social origin on occupational expectations and aspirations. While admitting that previous experience is partly a determiner, the authors state that "the most potent force operating is undoubtedly the experience through which the child passes during his involvement in that part of the educational system to which he has been assigned."—*H. Angelino*.

1930. Mogensen, A. **Perceived substructures and emotional attitudes towards a test battery and its parts.** *Scand. J. Psychol.*, 1962, 3(1), 30-32.—The potential value of an experimental and phenomenological approach for the study of the perception and cognition of ability tests is stressed. Some preliminary results from a pilot study of 12 students are given. The relationship between the Ss' emotional attitudes towards the tests and their perceptions and cognitions of the tests are briefly discussed.—*Journal abstract*.

1931. Montague, Anita C. (Temple U.) A factorial analysis of the "basic" interest patterns of two hundred women college students in various curricular groups. *Dissert. Abstr.*, 1961, 22(1), 324.—*Abstract*.

1932. Norton, Bruce Augustus. (Ohio State U.) Personality characteristics of militarists and pacifists. *Dissert. Abstr.*, 1961, 21(10), 3167.—*Abstract*.

1933. Parker, Erma B., & Reiss, Grace. Reluctance to go to school: A report of a follow-up study. *Soc. Wk.*, 1962, 7(2), 71-74.—The study confirms other reported studies in finding that reluctance to attend school often reflects the child's anxiety at separation from love-object, usually the mother. With early attention in the school setting only 1 of 18 children showed overt symptoms at time of the follow-up.—G. Elias.

1934. Prasad, R. G., & Singh, B. K. Some important characteristics of teachers and students. *Psychol. Stud., Mysore*, 1962, 7(1), 23-31.—235 undergraduate and postgraduate students and 45 teachers checked the questionnaire. All 3 groups mentioned 'knowledge of the subject' as an important characteristic of a good teacher. The qualities mentioned by students for good teachers are: honesty, impartiality, and good character. Undergraduate students gave more importance to teachers' interest in students and impressive appearance, while the postgraduate students preferred facility of expression. Both teachers and students agreed that good students are laborious and intelligent.—U. Pareek.

1935. Rebizov, D. G. (Pedagogical Inst., Ryazan', USSR) Ob otnoshenii uchastchikhsya k ucheniyu i trudu. [On the attitude of pupils toward study and work.] *Vop. Psikh.*, 1961, 7(6), 19-26.—Defining an attitude as a complex psychic phenomenon (and a substantial component of consciousness) school teachers and senior pedagogical institute students collected data on the attitudes of 8th and 9th grade pupils in village and city schools. Their methods involved long term observation of pupils during study and work, conversations with the pupils and their parents, analysis of the products of their work, etc. On the basis of these, judgments about the attitudes of pupils were made paying particular attention to such characteristics as initiative, discipline, attention, awareness of responsibility, etc. The village pupils received a somewhat lower evaluation than the city students, 67% vs. 84% receiving "good" or "excellent" evaluations. Sample protocols are given. 4 groups are distinguished: these who have a positive attitude towards study and work, those who have a positive attitude towards only work or towards only study, and finally, those who have a negative attitude towards both. The schools and family life are criticized for not developing proper motives in children.—H. Pick.

1936. Rosen, Marvin. (U. Pennsylvania) Valence, expectancy and dissonance reduction in the prediction of achievement striving. *Dissert. Abstr.*, 1961, 21(12), 3846.—*Abstract*.

1937. Siegel, Gerald M. (U. Minnesota) Inter-examiner reliability for mean length of response. *J. speech hear. Res.*, 1962, 5, 91-95.—Tape recordings were made of the verbalizations of 15 boys and 15 girls in response to the Children's Apperception Test cards. The Ss ranged in age from 11 to 17 years,

with a mean of 14.5, and were all residents of the Parsons (Kansas) State Hospital and Training Center for retarded children. The tape recordings were typed and the responses judged by 2 secretaries specifically trained. 2 other persons were trained to count the number of words in the 50 responses analyzed. The 4 individuals were equivalent with a reliability of .94. The average mean length of response used by the retarded children in the present study was considerably shorter than that used by normal 8-year-old school children studied by another investigator.—M. F. Palmer.

1938. Sutter, Cyril Robert. (Fordham U.) A comparative study of the interest and personality patterns of major seminarians. *Dissert. Abstr.*, 1961, 22(1), 328.—*Abstract*.

1939. Thistlethwaite, Donald L. (Vanderbilt U.) Fields of study and development of motivation to seek advanced training. *J. educ. Psychol.*, 1962, 53, 53-64.—Follow-up of 1086 academically talented college students, initially planning to enroll in one of 15 major fields of study, supports the hypothesis that faculty pressures and activities influence the student's desire to seek advanced training. Men who report that their teachers exert relatively strong press for independence, supportiveness, and affiliation—or who are exposed to Honors programs or to peer groups characterized by openness to faculty influence—tend to raise their aspirations for advanced training more than men not reporting such press. Plausible rival interpretations in terms of precollege characteristics were ruled out by covariance analysis. Differences between fields of study are greatest with respect to faculty press for humanism, scientism, vocationalism, and student social welfare orientations.—*Journal abstract*.

1940. Ueda, Toshimi. (Nara Gakugei U., Nara City, Japan) A study of anger in Japanese college students through the controlled diary method. II. *J. Nara Gakugei U., cultural soc. Sci.*, 1962, 10(2), 341-348.—Teachers' college freshmen recorded the instances when they felt anger during the day. No significant sex differences were found in frequency of anger responses but male students' anger tended to be milder and of shorter duration. Introverts tended to be angered by "abstract problems" and to experience intense anger more frequently and of longer durations than extroverts who were angered by "thwarted plans."—E. L. Borrowman.

1941. Washburn, Wilbur C. (U. California, Berkeley) Patterns of protective attitudes in relation to differences in self-evaluation and anxiety level among high school students. *Calif. J. educ. Res.*, 1962, 13(2), 84-94.—A forced-choice item test sampling 15 defense mechanisms was administered to groups of high school and college students. Support was found, at less than the .01 level of confidence, for the 3 hypotheses posited: (a) individuals who perceive themselves as inadequate will tend to develop more hostile defenses than those who perceive themselves as adequate in relation to others, (b) persons who evaluate themselves as inadequate will tend to adopt more retreating defenses than those regarding themselves as adequate, and (c) persons characteristically having more anxiety will tend to have fewer defensive attitudes justifying unacceptable behavior and avoiding blame than individuals experiencing less anxiety.—T. E. Newland.

1942. Wells, Harry K. (Hartwick Coll.) **Religious attitudes at a small denominational college as compared with Harvard and Radcliffe.** *J. Psychol.*, 1962, 53(2), 349-382.—An inventory of religious attitudes at Hartwick, a small church-related college, and a comparison of the findings with the results of the Allport-Gillespie-Young Harvard-Radcliffe study. The general conclusion is that the trend away from orthodoxy and sectarianism toward ecumenicism, ethical Christianity and secularism is as true at Hartwick as at Harvard and Radcliffe. However, in the former case it has not developed as far and, therefore, the level of religious attitudes is higher at Hartwick than at Harvard-Radcliffe. Where as Allport, Gillespie, and Young had predicted a marked difference between student religious attitudes at Harvard-Radcliffe and a small denominational college, the Hartwick findings indicate a difference within an essential identity. There is little appreciable difference between Hartwick and Harvard men. The Hartwick women account for most of the difference between coeducational Hartwick and Harvard-Radcliffe.—*Author abstract.*

1943. Witty, Paul. (Northwestern U.) **A study of pupils' interests: Grades 9, 10, 11, 12.** *Education*, 1961, 82, 39-45.—A representative sample of 300 pupils at each grade level, 9 through 12, was used to study the interests of pupils in the Chicago area. The questionnaire method was used to secure responses to inquiries concerning pupil's voluntary and preferred activities in 4 areas: television, radio, and movie pursuits; recreation and hobbies; vocational ambitions and educational choices; and the amount and nature of reading. Results of the study are analyzed and presented in 14 tables.—*S. M. Amatora.*

1944. Witty, Paul. (Northwestern U.) **A study of pupils' interests: Grades 9, 10, 11, 12.** *Education*, 1961, 82, 100-110.—This is the 2nd part of a study of high school pupils' interests (see 37: 1943). The present study deals with play and recreation interests and with reading interests with high school students. Analyses include seasonal activities preferred; outdoor sports or activities; objects constructed by pupils, extent of pet ownership; indoor sports and activities; extent of musical instruments played; home chores or duties; time spent in daily reading outside of school; influence of TV, radio, and movies upon reading; kinds of reading liked; kinds of stories liked; best books read; books other than story books liked; magazines best liked; favorite comic books and comic strips; and general activity preferences. Materials are presented in 25 tables.—*S. M. Amatora.*

1945. Witty, Paul. (Northwestern U.) **A study of pupils' interests: Grades 9, 10, 11, 12.** *Education*, 1961, 82, 169-174.—This is the 3rd in a series of studies of interests of high school pupils (see 37: 1943, 1944). The present investigation deals with vocational and educational interests of high school pupils. Presented in a series of 8 tables, interests are analyzed as follows: vocational preferences of boys and of girls, percentage of pupils holding part-time jobs, categories of jobs held, pupils who plan to attend college, parents who want their children to attend college, pupils who plan to attend business college or special school, best-liked subjects in high school, and subjects in which pupils reported best marks received.

All data are broken down by sex and by upper and lower division.—*S. M. Amatora.*

1946. Zavalloni, Marisa. (Columbia U.) **Youth and the future: values and aspirations of high school students in a multicultural society in transition-Trinidad, W. I.** *Dissert. Abstr.*, 1961, 21(11), 3542.—*Abstract.*

1947. Zimmerman, Elaine H., & Zimmerman, J. (Indiana U. Medical Center) **The alteration of behavior in a special classroom situation.** *J. exp. Anal. Behav.*, 1962, 5(1), 59-60.—"Unproductive classroom behavior was eliminated in two emotionally disturbed boys by removing social consequences of the behavior. Behavior which was more adequate and efficient with respect to social and scholastic adjustment was shaped and maintained with social reinforcers."—*Author abstract.*

SPECIAL EDUCATION

1948. Kirk, Samuel A. (U. Illinois) **Educating exceptional children.** Boston, Mass.: Houghton Mifflin, 1962. xvi, 415 p. \$6.00.—A comprehensive introductory textbook dealing with exceptional children and their special educational needs. The author found "the concept of split growth, or discrepancies in growth" particularly applicable to exceptional children and considers this the main contribution of his book. The exceptional child is defined as "that child who deviates from the average or normal child in mental, physical, or social characteristics to such an extent that he requires a modification of school practices, or special educational services, in order to develop to his maximum capacity." Discussion questions and selected references after each of the 14 chapters.—*B. Lowenfeld.*

Reading

1949. Ball, Richard J. (Owosso, Mich.) **Visual functioning in reading disability.** *Education*, 1961, 82, 175-178.—The present experiment was carried out at the Reading Center at Michigan State University with 200 children tested at the center. The purpose of the study was to show the necessity for communication between the visual specialists and the reading specialists. Results showed that visual disability may be a more serious problem in reading disability than previous research has shown.—*S. M. Amatora.*

1950. Brown, Charles M. (U. Southern California) **Whither basal reading.** *Education*, 1961, 82, 3-5.—An experiment was conducted to investigate the claim for the values of an individual reading program versus a basal reading program. Included in the study were 21 elementary, 5 junior high, 3 high schools and 1 junior college in Los Angeles County. The author concluded that from observations made and data obtained, the basal reading program had produced excellent results in the county. It is problematical whether an individualized reading program would have improved these results to any appreciable degree. No change to the individualized program was recommended.—*S. M. Amatora.*

1951. Harris, Theodore L. (U. Wisconsin) **Summary of investigations relating to reading: July 1, 1960 to June 30, 1961.** *J. educ. Res.*, 1962, 55(5), 197-220.—"Research related to reading in the previous year shows several promising trends. A

number of the investigations revealed great care in experimental design to control significant variables. Thorough and scholarly analyses of related research accompanied others. A willingness to examine intensely the significant learning processes in reading was likewise evident, as was cooperative endeavor among workers representing several disciplines of study. As such efforts are continued, they should advance the understanding of reading processes, effects, and conditions, to the more effective utilization of reading in daily life." (148 ref.)—*F. Goldsmith.*

1952. Kawi, Ali A., & Pasamanick, Benjamin. (State U. New York, Coll. Medicine) *Prenatal and paranatal factors in the development of childhood reading disorders. Monogr. Soc. Res. Child Develpm.*, 1959, 24(4, Whole No. 73), 80 p.—With the hypothesis that there exists an association between maternal and fetal factors and the development of reading disabilities, the authors compared the prenatal and paranatal records of 372 white male children with reading disorders with the records of a similar number of matched controls. The results indicate an existing relationship between certain abnormal conditions—such as premature birth, toxemias of pregnancy, and bleeding during pregnancy—and subsequent reading disorders. The suggestion is that some reading disorders are a component of the continuum of reproductive casualty.—*J. S. Braun.*

1953. Keating, L. E. A pilot experiment in remedial reading at the hospital school, Lingfield, 1957-60. *Brit. J. educ. Psychol.*, 1962, 32(1), 62-65.—Instruction was changed from reading in a class to "reading at mother's knee." Many procedures were used. Results suggest that the time and effort spent were worthwhile.—*B. T. Jensen.*

1954. Langmeier, J., Matějček Z., & Konias, V. Vývojová dyslexie: II. Některé otázky hodnocení špatného čtení. [Developmental dyslexia: II. Appraisal of reading disabilities.] *Ceskoslov. Psychol.*, 1961, 5, 223-233.—Reading ability of 382 children aged 7-10 years selected at random from 18 Prague schools was compared with that of 352 children designated by teachers as the worst readers in the class. Reading speed, number, and kind of errors were analyzed. Results may serve as a basis for the appraisal of the reading maturity of children by clinical psychologists. The scale for the appraisal of severe dyslexia defects is being prepared. (Russian & English summaries)—*V. Bricháček.*

1955. Lovell, K., Johnson, E., & Platts, D. (U. Leeds) A summary of a study of the reading ages of children who had been given remedial teaching. *Brit. J. educ. Psychol.*, 1962, 32(1), 66-71.—210 boys and girls who had received at least 3 months of class or individual remedial reading were retested from 12-48 months afterwards. After remedial teaching ceased, improvement in reading age was 58% and 55% for individual and class teaching, respectively, when compared with improvement during instruction. Other results are discussed.—*B. T. Jensen.*

1956. Robinson, Francis P. (Ohio State U.) *Effective reading.* New York: Harper, 1962. viii, 94 p. \$1.35.—Presents the SQ3R (Survey, Question, Read, Recite, Review) method of reading.—*C. H. Miley.*

1957. Roche, Helen. (Kramer School, Center Line, Mich.) *Junior Primary in the Van Dyke Level plan.* *J. educ. Res.*, 1962, 55(5), 232-233.—

In September 1943 a pilot study was started in Michigan schools to test the possibility of replacing the rigid grade system by a flexible plan of self-pacing in the reading situation. The plan was called the Level System. After 10 years of research the following conclusions were drawn: children not ready for reading profit more by being kept in a readiness situation until prepared for formal reading than by being placed in the 1st grade, failing and having to repeat the work. Moving children ahead into a formal reading program only after they succeed on the junior primary level does not delay their school progress. Their rate in moving ahead depends on their speed of maturation in mental, social, and emotional areas. This cannot be accelerated.—*F. Goldsmith.*

1958. Tjossem, Theodore D., Hansen, Thomas J., & Ripley, Herbert S. (U. Washington School Medicine, Seattle) *An investigation of reading difficulty in young children. Amer. J. Psychiat.*, 1962, 118, 1104-1113.—24 children with reading problems were studied from a medical and psychological standpoint with special attention given to the medical history as a diagnostic tool. An evaluation of 2 different methods of instruction in reading is made by relating the children's performance to the results of diagnostic assessment.—*N. H. Pronko.*

1959. Troxel, Vernon. (U. Kansas) *The effects of purpose on the reading of expository materials in grade eight. J. educ. Res.*, 1962, 55(5), 221-227.—The purpose for reading influences the speed with which the material is read. Those who read the expository mathematical material faster and with greater accuracy also tend to achieve higher scores on the general reading ability test, but this relationship is not perfect. The relationship between high scores on general reading ability tests and superior scores for speed and accuracy are reduced when intelligence is held constant. Speed and comprehension scores on a general reading test are not necessarily good predictors of speed and accuracy for other kinds of material read for other purposes. Ability to read expository mathematical material successfully is no accurate indicator of success in arithmetic. There is a tendency for faster readers to be more accurate when they are reading expository mathematical material.—*F. Goldsmith.*

1960. Walters, Richard H., Loan, Malle Van, & Crofts, Irene. (U. Toronto) *A study of reading disability. J. consult. Psychol.*, 1961, 25(4), 277-283.—"Retarded readers performed more poorly on two perceptual tasks involving recognition of form . . . slower in opening a compartment to look for a male nude doll . . . chose their father less often on a simple parent preference test." Psychoanalytic and parental theories are discussed.—*E. R. Oetting.*

MENTAL RETARDATION

Gifted Students

1961. James, Newton E. (U. Arizona) *A motivational and surveillance program for talented college students. Personnel guid. J.*, 1962, 40(8), 723-727.—The study was designed to stimulate scholarship in students who appeared to have high potential for academic achievement. While the program objectives cannot be conclusively demonstrated, several beneficial by-products have been secured.—*S. Kavruck.*

1962. Klausmeier, Herbert J., & Ripple, Richard E. (U. Wisconsin) Effects of accelerating bright older pupils from second to fourth grade. *J. educ. Psychol.*, 1962, 53, 93-100.—An experiment was conducted to ascertain the effects of accelerating from 2nd to 4th grade pupils of superior learning abilities (SLA) who were above the median CA of all 2nd graders and who had attended a 5-week summer session. The Ss were 1 group of 26 accelerated to the 4th grade; 2 groups of 26 nonaccelerated 3rd graders of SLA, 1 above and 1 below median CA; 2 groups of 26 nonaccelerated 4th graders of SLA, 1 above and 1 below median CA; and 2 groups of 26 nonaccelerated 4th graders of average learning ability, 1 above and 1 below media CA. Based on the performance of the Ss on 32 measures, no unfavorable academic, social, emotional, or physical correlates of acceleration were found. Acceleration of pupils of SLA and above median CA after a 5-week summer session seemed desirable.—*Journal abstract*.

1963. Smith, David Wayne. (U. Arizona, Tuscon) A broader concept of giftedness. *Education*, 1962, 82, 295-298.—Various approaches to the concept of giftedness are explored, pointing out also the distinction between giftedness and eminence. Giftedness is no guarantee of genius or even of outstanding achievement. Heredity, environment, personal factors, and social factors are analyzed; and a 2-fold approach is suggested.—*S. M. Amatora*.

EDUCATIONAL GUIDANCE

1964. Beals, Lester, & Simmons, Patricia. Counseling needs of gifted high school students. *Personnel guid. J.*, 1962, 40(8), 712-716.—A sample of 310 students identified as gifted by scores of 140 on the Language or Non-Language sections of the CTMM was followed up. The results indicate that counselors could well spend more time in providing information to teachers to pass along to students. A team approach including counselor, teacher, and parent is suggested.—*S. Kavruck*.

1965. Bonnardel, R. Liaisons entre examens psychologiques et résultats scolaires d'un groupe d'étudiants en psychologie appliquée. [Relationship between psychological tests and scholastic achievement of students in applied psychology.] *J. Psychol. norm. pathol.*, 1960, 57(4), 431-443.—The results of some 60 students taking the final examinations of the Institute for Applied Psychology at the University of Paris were compared with scores on several tests which the students had taken during their practicum training. The correlations between the tests and the final exams were similar to those between the several parts of the latter. The author concluded that the tests provided a basis for more rational selection and student counseling.—*M. L. Simmel*.

1966. Buchheimer, Arnold, & Balogh, Sara Carter. (City U. New York) The counseling relationship: A casebook. Chicago, Ill.: Science Research Associates, 1961. xv, 234 p.—Primarily for public school counselors in training and for in conjunction with counseling texts. 4 chapters cover the following areas: (a) questions most commonly asked by the beginning counselor, such as, what is the professional image of the counselor, how to "structure" the interview, and how to obtain information; (b) an analysis of the relationship between counselor and

counselee as it evolves in successive phases of the interview; (c) methods of inferring and constructing a self-concept as exemplified by 3 complete counseling interviews; and (d) a theory to guide the counselor in the development of the self-concept in children. A final chapter presents 4 interviews as exercises at the elementary, junior high, and senior high school levels. (66-item bibliogr.)—*B. Lowenfeld*.

1967. Davis, D. A., Hagan, N., & Strouf, J. Occupational choice of twelve-year-olds. *Personnel guid. J.*, 1962, 40(7), 628-629.—60% of 116 12-year-old 6th graders made tentative occupational choices. Maturity of choice appears to be related to intelligence being female, and inversely to reading retardation. Ginzberg's theory of occupational choice appears substantiated.—*S. Kavruck*.

1968. Hardee, Melvane Draheim. (Florida State U.) Research on college students: The student personnel worker's view. *Educ. Rec.*, 1962, 43(2), 132-138.—4 educational needs are surveyed: (a) construction of well-founded premises for altering traditional student personnel programs, (b) explicite bases for initiating student personnel programs in new colleges, (c) recognition of current trends in the exploration of student characteristics, and (d) utilization of the results of research in current programs. Student personnel workers can ensure continuing quality in their programs by systematic research and self-study.—*W. W. Meissner*.

1969. Hewer, V. H., & Neubeck, G. (U. Minnesota) Occupations of fathers and mothers of entering University of Minnesota freshmen. *Personnel guid. J.*, 1962, 40(7), 622-627.—Fathers of freshmen entering University of Minnesota are employed more frequently in managerial, professional, and sales occupations, than would be expected from the census distribution. Other occupations in order of frequency are: skilled, clerical, farming, semi-skilled, and unskilled. Over ½ of the mothers are not employed outside the home. 22% are employed full time and 16% part time.—*S. Kavruck*.

1970. Hoyt, Kenneth B. (State U. Iowa) Guidance: A constellation of services. *Personnel guid. J.*, 1962, 40(8), 690-697.—The emerging concept of the school guidance counselor as a member of the pupil personnel work team—detached from close relationships with teachers and administrators and trained in psychology rather than in teacher education—is opposed. An alternate proposal is presented. The burden of research proof must rest with the proponents of change.—*S. Kavruck*.

1971. Hutson, P. W. (U. Pittsburgh) Foundations of the curriculum for the education of homeroom teachers. *Personnel guid. J.*, 1962, 40(8), 698-702.—Concepts of distributive and adjustive guidance were examined as they related to the work of the homeroom teacher. It is proposed that teacher-educators check courses against the concepts and take remedial action in creating changes in the curriculum to create understandings essential for homeroom guidance.—*S. Kavruck*.

1972. Katz, M. Educational Testing Service, Princeton, N. J.) Interpreting Kuder Preference Record scores: Ipsative or normative. *Voc. guid. Quart.*, 1962, 10, 96-100.—A critical discussion of the 2 kinds of comparisons (intra- and inter-personal) possible with the Kuder Preference Record—Voca-

tional. For scores above the 75 percentile, there is little empirical evidence to show satisfaction or success. Each raw score tally is made "at the expense" of another scale so that the person with many strong interests might score lower on one scale than a person with only mild interest in the same area. Furthermore, use of the KPR-V tends to assume the exploration of interests has already taken place.—*W. L. Barnette, Jr.*

1973. Lee, Carson. (Indiana U.) A study of the effects of counseling in reducing the number of problems indicated by high school freshmen and seniors. *Dissert. Abstr.*, 1961, 21(11), 3517-3518.—*Abstract.*

1974. McCully, C. Harold. (United States Office Education) The school counselor: Strategy for professionalization. *Personnel guid. J.*, 1962, 40(8), 681-689.—6 developmental tasks are suggested which relate to the professionalization of the school counselor's occupation. The identification of the counselor's specific role in the school, standards for selection and training, accreditation, certification, and the problem of ethics are discussed. As a newly-emerging profession, the dangers of smugness, hypersensitivity, and self-consciousness must be avoided. (46-item bibliogr.)—*S. Kavruck.*

1975. Mehta, Prayag. (National Inst. Education, Delhi) Counselor's task in the Indian context. *MANAS, Delhi*, 1961, 8, 37-40.—A counselor's task is to help in meeting manpower needs. He can do this by helping students develop interest, good study habits, healthy attitudes, proper values, and correct vocational choices. He should coordinate the interests of students, teachers, and parents.—*U. Pareek.*

1976. O'Hara, R. P. (Boston Coll.) Acceptance of vocational interest areas by high school students. *Voc. guid. Quart.*, 1962, 10, 101-105.—A report of accept and reject patterns (above 75 percentile and below 25 percentile) of 1021 boys, Grades 9-12, in a private Catholic school in Boston where the Kuder Preference Record-Vocational was used. Over 50% of these boys score above the 80 percentile for their grade on both Numerical and Verbal subtests of the DAT. Accept and reject patterns for each of the 10 Kuder scales are reported and compared with Shoemaker's Missouri data. It is felt that bright lower class boys will have clear cut acceptance-rejection patterns while the average or low intelligence middle or upper class boy will tend to have flatter profiles.—*W. L. Barnette, Jr.*

1977. Pritchard, David H. (VA Central Office, Washington, D. C.) The occupational exploration process: Some operational implications. *Personnel guid. J.*, 1962, 40(8), 674-680.—"We must seek to obtain, develop, and use occupational tools sensitive to the expanded kinds of variables, occupational as well as personal, identified as significant to vocational development, success, and satisfaction. Occupational exploration should generally give precedence to the broader and longer view of progressive vocational planning over the more limited view of a onetime, final occupational choice." (24-item bibliogr.)—*S. Kavruck.*

1978. Riccio, Anthony C., & Roach, A. I. (Ohio State U.) Influence of social factors on the guidance program. *Cath. educ. Rev.*, 1961, 59, 448-456.—A representative sample drawn from a student body

of 1400 was chosen so as to include members from 28 parishes and 5 different nationality groups. Factors studied include intelligence, father's occupation, mother's occupation, religious affiliation of parents, race and nationality, language spoken in the home, number of children per family, number of people per household, parents' education, type of home dwelling, home provisions of students, and career choices. Analysis of each part is presented, and the significance of the findings for purposes of guidance is given.—*S. M. Amatora.*

1979. Rusalem, Herbert. (Hunter Coll.) Guiding the physically handicapped college student. New York: Columbia Univer., 1962. xi, 151 p. \$2.75.—Facilities, administration policies and procedures, curricular and extracurricular activities, counseling programs, available resources for blind and partially seeing, deaf and hard-of-hearing, orthopedically and otherwise disabled students on the college level are described and practical suggestions are made to facilitate their adjustment and success.—*B. Lowenfeld.*

1980. Schmidt, Lyle D. (Ohio St. U.) Concepts of the role of secondary school counselors. *Personnel guid. J.*, 1962, 40(7), 600-605.—The study attempted to clarify counselor functions and attitudes towards such functions. Counselors and principals were selected from 48 schools in Missouri and asked to react to Q-sort statements on work being done and work which should be done. Both counselors and principals perceived significant and positive relationships between actual and ideal counselor roles. Counselors did not perceive as great a similarity between their actual and ideal roles as did principals. Additional findings are discussed.—*S. Kavruck.*

1981. Searles, Aysel, Jr. (Harpur Coll.) The effectiveness of limited counseling in improving the academic achievement of superior college freshmen. *Personnel guid. J.*, 1962, 40(7), 630-633.— $\frac{1}{2}$ of the superior freshmen expressed a need for counseling. 3-interview counseling does not appear to have any significant effect on 1st-semester academic achievement of freshmen who have been selected from the upper $\frac{1}{2}$ of a sample of New York State high schools.—*S. Kavruck.*

1982. Viteles, Morris S., Brayfield, Arthur H., & Tyler, Leona E. (U. Minnesota) Vocational counseling: A reappraisal in honor of Donald G. Paterson. *Minn. Stud. student personnel Wk.*, 1962, No. 11. 70 p.—A symposium organized by officers of Division 17 of the American Psychological Association to honor Donald G. Paterson on the occasion of his retirement in 1960. The authors sketch the history of vocational guidance—its past, present, and projected future.—*C. H. Miley.*

1983. Waldkoetter, R. O. A comparative guidance study: Group counseling with selected African student-teachers. *Personnel guid. J.*, 1962, 40(7), 638-642.—Group counseling could bring desirable results in terms of academic improvement. 2 experimental groups counseled separately in Akan and English did not differ significantly in academic achievement. The counseled groups differed from a control group at the 5% level.—*S. Kavruck.*

1984. Wilson, John A. R., & Stier, Lealand D. Instability of sub-scores on forms of SRA Primary Mental Ability Tests: Significance for guid-

ance. *Personnel guid. J.*, 1962, 40(8), 708-711.—“The test seems to be subject to so much instability that it should not be used alone for making decisions that are vital in a child's educational growth.”—S. Kavruck.

1985. Winborn, Bob., & Schmidt, Louis G. (North Texas State Coll.) The effectiveness of short-term group counseling upon the academic achievement of potentially superior but underachieving college freshman. *J. educ. Res.*, 1962, 55(4), 169-173.—The work was done on 135 freshmen in the academic year 1958-59 at Indiana University. Results: The students who did not participate in a short-term group counseling program made significantly higher grade point averages than did the participants in the program. This indicates that short-term group counseling can produce a negative effect on the academic achievement of potentially superior freshmen. Another finding was that the majority of freshmen who were designated potentially superior but underachieving students could not be identified as such on the basis of information available to university officials prior to receipt of 1st-semester grades.—F. Goldsmith.

EDUCATIONAL MEASUREMENT

1986. Boag, Audrey K., & Neild, Margaret. (Hornell High School, Hornell, N. Y.) The influence of the time factor on the scores of the Triggs Diagnostic Reading Test as reflected in the performance of secondary school pupils grouped according to ability. *J. educ. Res.*, 1962, 55(4), 181-183.—The above test was administered to the 9th, 10th, 11th, and 12th grades at Hornell High School under timed and untimed conditions. Some high-school students made marked changes in their relative standings when they were given additional time to work on the test. Therefore, speed and power scores cannot be used interchangeably. The average student, (that is, the slow and accurate student) comes out nearer the top when given plenty of time but suffers when there is a time limit. Changes in relative standings occurred with considerably greater frequency through the middle range of scores than at either extreme.—F. Goldsmith.

1987. Bowles, Frank H., & Pearson, Richard. Admission to college: A program for the 1960's. Princeton, N. J.: College Entrance Examination Board, 1962. 130 p. \$50.—This chronicles activities and programs of the College Entrance Examination Board between 1959 and 1961. Identifies projected board activities.—C. H. Miley.

1988. Das, R. C. (Radhanath Training Coll., Cuttack, India) A study of item analysis of an essay type test. *MANAS*, 1960, 7(1), 37-40.—The problem of calculating difficulty and discriminating index of items in essay type tests has been discussed.—U. Pareek.

1989. Davis, Frederick B. (Hunter Coll.) Testing and the use of test results. *Rev. educ. Res.*, 1962, 32(1), 5-14.—The outstanding source of information about tests was *The Fifth Mental Measurement Yearbook*, edited by Buros (1959). This volume covered the years 1952-58 and listed 957 tests. The usefulness of the yearbooks rests primarily on the quality of the original reviews written for them; a high standard has been reached in this edition.

Other studies were probing test selection and use, their administration and scoring, test score reporting and interpretation, assessment of change, and measurement-theory. (63 ref.)—F. Goldsmith.

1990. Educational Records Bureau. 1961 fall testing program in independent schools and supplementary studies. *Educ. Rec. Bull.*, 1962, No. 80, xiii, 69 p.—This bulletin includes a summary of testing results in 536 member independent schools. Tests used were group intelligence, scholastic aptitude, reading, spelling, and reading readiness. Results on specific tests are discussed in separate chapters.—E. M. Bower.

1991. Hewitt, John H., & Rosenberg, Leon A. (Army Medical Service School) The MMPI as a screening device in an academic setting. *Educ. psychol. Measmt.*, 1962, 22(1), 129-137.—“Ninety-five graduates of three courses at the Army Medical Service School were administered, upon admittance, the Shortened Version of the Group Form of the MMPI in an attempt to determine the predictive value of this test. Profiles obtained from this group were compared with those of 16 subjects who were not admitted to a course, and with those of 11 subjects who failed a course. Results indicated that the profiles obtained by all three groups were essentially the same, with those of the group admitted being slightly more abnormal. . . . the study found no single measure or combination of measures by the MMPI which would provide interviewers with clues regarding a given individual's chances for success in a course.”—W. Coleman.

1992. Jamuar, K. K. (Patna U.) Secondary school examination record as a criterion for admission at the university level. *Psychol. Stud., Mysore*, 1961, 6(1), 47-49.—Correlation between high school and college marks is too low to warrant any prediction of results at the university on the basis of school marks.—U. Pareek.

1993. Klausmeier, Herbert J., Harris, Chester W., & Ethnathios, Zackaria. (U. Wisconsin) Relationships between divergent thinking abilities and teacher ratings of high school students. *J. educ. Psychol.*, 1962, 53, 72-75.—The stability of factors of divergent thinking (DT) is Ss of school age and the relationship between factor scores and performances of the Ss remain to be defined. 78 boys and 113 girls with IQ's of 115 and higher were administered DT tests as 10th and 11th graders. 3 factors were found common to both sexes and relatively stable over a 12-month interval. 15 of 28 r's between factor scores and teacher ratings of the Ss' DT performances as 11th graders in English, mathematics, science, and social studies were low, positive, and significant at or beyond the .10 level. The nature of the DT factors and the expression thereof in classroom activities varied markedly according to sex and subject field.—*Journal abstract*.

1994. Kline, William Edward. (Princeton U.) A synthesis of two factor analyses of intermediate algebra. *Dissert. Abstr.*, 1961, 21(11), 3516-3517.—*Abstract*.

1995. Little, E. B. (U. Illinois) Overcorrection for guessing in multiple-choice test scoring. *J. educ. Res.*, 1962, 55(6), 6, 245-252.—Correction formulae are frequently used to compensate for guesswork on multiple-choice tests on the assumption that

the reduced score gives a more accurate picture of the student's actual ability. A test pattern analysis was undertaken on a multiple-choice test which was administered 3 different times to the same group of students. Some wrong answers were not marked in accordance with the laws of chance but instead were based on positive misinformation. The author recommended, therefore, that use of the correction formula be abandoned.—*F. Goldsmith.*

1996. Marks, Merle B. (U. Southern California) **Better directions—better response.** *Audiovis. Commun. Rev.*, 1962, 10(3), 169-175.—A comparison of the effectiveness of formats for written test directions. The same directions presented in 22 different formats were used in testing 1650 students in a single junior high school. Hand printed directions with key words in bold lettering and directions in primary size type-writer letters were significantly superior to the control format in eliciting desired responses. A 2nd experiment to test promising format combinations gave results no better than single treatments. 8 recommendations for format presentation are given.—*R. E. Schuitz.*

1997. Morin, J. **Notation psychométrique et professionnelle de jeunes ingénieurs.** [Psychometric and professional characteristics of young engineers.] *Travail hum.*, 1961, 24, 201-211.—Test scores of a sample of 54 engineers were compared after 2-5 years of work experience. There was a correlation of +.45 with total test score and the Standard Bonnardel Examination, which contains 6 parts relating to fundamental abilities. Each subtest also correlated well with total criterion.—*R. W. Husband.*

1998. Wall, H. W., Marks, E., Ford, D. H., & Zeigler, M. L. **Estimates of the concurrent validity of the WAIS and normative distributions for college freshmen.** *Personnel guid. J.*, 1962, 40(8), 717-722.—The study attempted an evaluation of the validity of the WAIS in relation to scholastic aptitude and achievement among freshmen at Pennsylvania State University. Relationships were obtained but were smaller than expected. Normative data for freshmen in both science and nonscience curricula were obtained.—*S. Kavruck.*

Aptitudes

1999. ELnasr, Abe Elmonim Abu. (Columbia U.) **A factorial analysis of personal-social problem-solving abilities of high school students.** *Disser. Abstr.*, 1961, 22(1), 345-346.—*Abstract.*

2000. Fischer, Hardi, & Butsch, Charles. (Eidgenössische Technische Hochschule, Zürich, Switzerland) **Musikalische Begabung und Intelligenz.** [Musical aptitude and intelligence.] *Z. exp. angew. Psychol.*, 1961, 8(4), 508-518.—A matrix was prepared correlating the results of 6 Seashore musical aptitude tests and 6 intelligence tests. 101 pupils between the ages of 10 and 15 served as Ss. A factor analysis revealed a close relationship between musical aptitude and general intelligence.—*W. J. Koppitz.*

▲ 2001. Flanagan, John C., Dailey, John T., Shaycoft, Marion F., Gorham, William A., Orr, David B., & Goldberg, Isadore. **The talents of American youth: I. Design for a study of American youth.** Boston, Mass.: Houghton Mifflin, 1962. 240 p. \$4.00 (cloth), \$1.95 (paper).—The 1st of a series of reports concerning Project TALENT. In it is de-

scribed the design of a study of the talents of American youth; the method of selecting students and schools; the construction of tests, inventories, and questionnaires and their administration; and the proposed methods of analyzing the data. Chapter 14 presents a brief description of the future steps to be taken in this research. The next book in this series will report the results of analyzing the school and guidance information which has been collected. The 3rd book will contain the results of the analysis of student data, whereas the 4th book will cover the 1st 1-year follow-up, the process of checking hypotheses, and the revision of them. An appendix of 5 parts is included.—*J. S. Ahmann.*

2002. Milholland, John E., & Fricke, Benno G. (U. Michigan) **Development and application of tests of special aptitude.** *Rev. educ. Res.*, 1962, 32(1), 25-39.—The distinction between aptitude and achievement tests probably has broken down because achievement tests have been found to provide generally better predictions of future achievement than have aptitude tests. A variety of studies have used multiscore tests, but usually no more than one criteria was involved—over-all academic success. Research has shown conclusively that for most such criterion-prediction problems, it rarely is necessary to employ more than a single general-aptitude measure. Useful studies of the selection of students for medical school continue to be published. (52 ref.)—*F. Goldsmith.*

2003. Pimsleur, Paul; Stockwell, Robert P., & Comrey, Andrew L. (Ohio State U.) **Foreign language learning ability.** *J. educ. Psychol.*, 1962, 53, 15-26.—This report on 2 studies of factors involved in learning French is based on 23 tests administered to 208 students in college French, and on 22 tests administered to 202 additional students a year later. The factors extracted and rotated in each study included: Verbal, Reasoning, Speed of Articulation, Pitch Discrimination, Timbre Discrimination, Interest, and Biographic. Multiple correlation test selection analyses resulted in (a) $R = .65$, using 6 tests to predict Cooperative French Test scores; and (b) $R = .41$, using 5 tests to predict aural comprehension; and (c) $R = .41$, using 5 tests to predict speaking proficiency. Verbal IQ and Interest (motivation) appear to be the most important factors in college foreign language learning; Reasoning, Word Fluency, and Pitch Discrimination also contribute.—*Journal abstract.*

Achievement

2004. Bertrand, Alvin L. **School attendance and attainment: Function and dysfunction of school and family social systems.** *Soc. Forces*, 1962, 40(3), 228-233.—Dropping out of high school is contradictory to national educational goals but can be explained in terms of family values or school factors which tend to operate against those goals. Interview data were obtained from 369 students in 8 relatively rural Louisiana high schools, 68 drop-outs, parents of youth in both these groups, principals, and teachers.—*A. R. Howard.*

2005. Carp, Paul W., Jr. (U. Tennessee) **The effect of class attendance and "time structured" content on achievement in general psychology.** *J. educ. Psychol.*, 1962, 53, 76-80.—The effects of attending class and of structuring an introductory psychology course with respect to time and content were

studied, using 335 undergraduates in a 2×3 factorial design. Time structuring was accomplished through schedules of testing. Using end-of-course achievement test scores as the criterion, F ratios for neither the class attendance variable, the time structure variable, nor the treatment interaction were significant at the .10 level. It was concluded that students performed as well through independent study as in the conventional class situation, and time structured content was ineffective as a determiner of student achievement. Student dropouts and the number of students seeking individual assistance were unrelated to the experimental treatments.—*Journal abstract.*

2006. Cook, David R., & Martinson, William D. **The relationship of certain course work in high school to achievement in college.** *Personnel guid. J.*, 1962, 40(8), 703-707.—The results do not support the popular notion that a particular set of courses is especially crucial for the college "success" of a student. Colleges need to place more stress on the quality of work done and less on the pattern of courses taken.—*S. Kavruck.*

2007. Curry, R. L. (Baylor U.) **The effect of socio-economic status on the scholastic achievement of sixth-grade children. Part I.** *Brit. J. educ. Psychol.*, 1962, 32(1), 46-49.—360 6-grade pupils randomly selected from 2633 students in Southwestern United States. CTMM and CAT and socio-economic data were used. "As the intellectual ability decreases from high to low, the effect of social and economic conditions on scholastic achievement increases greatly." The effect seems to be primarily upon language, achievement in arithmetic seems relatively free of the influence.—*B. T. Jensen.*

2008. Fink, Martin B. (Mt. Diablo, Calif., Unified School District) **Self concept as it relates to academic underachievement.** *Calif. J. educ. Res.*, 1962, 13(2), 57-62.—Matched on the basis of CTMM IQ and sex, 20 pairs of boys and 24 pairs of girls produced a miscellany of psychological test data which were analyzed independently by 3 psychologists as to evidence of adequate and inadequate self-concept. The hypothesis that adequate self-concept is related to high academic achievement and that inadequate self-concept is related to low (under) achievement was supported at the .01 level for boys and at the .1 level for girls.—*T. E. Newland.*

2009. Gill, Lois J., & Spilka, Bernard. (Denver Public Schools) **Some nonintellectual correlates of academic achievement among Mexican-American secondary school students.** *J. educ. Psychol.*, 1962, 53(3), 144-149.—The purpose of this study was to determine personal and maternal correlates of academic achievement among Mexican-American secondary school students. 4 groups (15 each) of achieving and low achieving boys and girls were identified and equated in age, IQ grade level, and courses taken. Employing standard objective measures, it was shown that achievers manifested reliably less hostility and more social maturity, intellectual efficiency, and conformity to rules. Achieving girls and underachieving boys appear to come from strong mother-dominated homes. Since these findings seem meaningful with respect to this subculture, it is suggested that such study of achievement in minority groups may better clarify the nature of relationships among hypothesized variables.—*Journal abstract.*

2010. Holland, John L., & Astin, Alexander W. (National Merit Scholarship Corp.) **The prediction of the academic, artistic, scientific, and social achievement of undergraduates of superior scholastic aptitude.** *J. educ. Psychol.*, 1962, 53(3), 132-143.—Undergraduate achievement in academic, artistic, scientific, and social areas was predicted from extensive assessments in the high school senior year for 4 independent samples of high aptitude students (N ranged from 354 to 953) over intervals from 1 to 4 years. The criteria of college achievement included grades, checklists of unusual accomplishments in science and art (e.g., publications, winning public recognition through awards and prizes), and election to student offices. Predictors included: scholastic aptitude, personality, originality, interest, parental attitude variables, and background information. Correlational analyses indicated that achievers in each of the 4 areas resemble our stereotypes of the scientist, artist, leader, and academic achiever.—*Journal abstract.*

2011. Kazmier, L. J. (U. Notre Dame) **Criterion simulation and the prediction of achievement.** *Psychol. Rep.*, 1962, 10(1), 64.—A simulated criterion (work sample) was included in a test battery to predict performance in a college course.—*B. J. House.*

2012. Merwin, Jack C., & Gardner, Eric F. (U. Minnesota) **Development and application of tests of educational achievement.** *Rev. educ. Res.*, 1962, 32, 40-50.—Of all the areas of measurement influenced by the National Defense Educational Act, achievement testing and aptitude testing have probably felt the greatest impact. Studies of testing techniques vary widely. Some aim primarily at finding more efficient ways to use tests, while others center on the meaningfulness of the results obtained. There have been occasional bold attempts to redefine the demarcation lines between aptitude and achievement tests. During the period under review, noticeable progress has been made in understanding the use of achievement tests as predictors and the relationship between anxiety and achievement-test performance. (67 ref.)—*F. Goldsmith.*

2013. Phatak, Pramila. **Exploratory study of creativity and intelligence and scholastic achievement.** *Psychol. Stud., Mysore*, 1962, 7(1), 1-9.—32 students 9-11 years of age were administered nonverbal creativity test devised at the University of Minnesota (circle test and incomplete figure test) and Draw-a-Man Test. Results show that "creativity as measured by the tests is moderately related to intelligence." It shows no significant relationship with examination marks or teacher ratings. No significant sex or age differences were found.—*U. Pareek.*

2014. Red, S. B., McCary, J. L., & Johnson, Bette. (U. Houston) **A study of the relationship between aspirational levels and academic achievement.** *J. educ. Res.*, 1962, 55(4), 159-163.—101 freshmen and sophomore university students were given an adaptation of the Cassel Group Level of Aspiration Test and the Otis Quick-Scoring Mental Ability Tests—Gamma and Revised Beta. All correlation coefficients and comparisons between aspiration and academic achievement measures showed little relationship.—*F. Goldsmith.*

2015. Street, Paul; Powell, James H., & Hamblen, John W. (U. Kentucky) **Achievement of**

students and size of school. *J. educ. Res.*, 1962, 55(6), 261-266.—This study examined the possible relationship between performance of students and the size of the schools (in terms of enrollment) which they attended in a mining and rural area of eastern Kentucky. The Stanford Achievement Tests were administered to 2700 students in 7th and 8th grades. The elementary schools were classified by size into 3 groups: Group I—300 or more; Group II—more than 100, less than 300; Group III—less than 100. While the study was limited to schools of less than 900 enrollment, the writers believe that their data may apply to many debates about school size. The students in larger schools tended to outperform students in smaller schools.—*F. Goldsmith.*

2016. Todd, Frederick, J., Terrell, Glenn, & Frank, Curtiss E. (U. Colorado) Differences between normal and underachievers of superior ability. *J. appl. Psychol.*, 1962, 46, 183-190.—An attempt was made to obtain descriptive information about bright normal achievers and underachievers with respect to 4 theory-related variables. 4 hypotheses were stated predicting that, as compared with normal achievers, underachievers would manifest less need for academic achievement, would be less likely to have decided on specific vocational goals, would be more likely to perceive a relationship between coursework and attainment of goals, and would have lower expectancy for success in academic pursuits. The results obtained through the administration of 2 personality inventories and a specially devised questionnaire provided some support for all 4 hypotheses for male Ss. For female Ss, however, support was found for only 2 of the 4 hypotheses. The results were discussed with reference to sex differences.—*Journal abstract.*

2017. Van Biljon, I. J. (U. Stellenbosch, South Africa) Akademiese vordering van studente aan 'n Suid-Afrikaanse universiteit. [A comparison of academic performance among students at a South African university.] *J. soc. Res., Pretoria*, 1961, 12 (1), 21-26.—"The academic success and failure of first, second, and third year students at a South African university were studied. The failure of third year students appears to be exceptionally high. Women students and students who obtained first class passes in matric do well in their studies." (Dutch & English summaries)—*N. De Palma.*

EDUCATIONAL PERSONNEL

2018. Almy, Millie. (Teachers Coll. Columbia U.) Intellectual mastery and mental health. *Teach. Coll. Rec.*, 1962, 63(6), 468-478.—The literature is reviewed for suggestions on the role and requirements of the teacher in promoting environmental mastery.—*H. K. Moore.*

2019. Cratty, Bryant J. (U. California, Los Angeles) The assessment of teacher sensitivity. *Calif. J. educ. Res.*, 1962, 13, 72-77.—"Teacher sensitivity" is present when both student and teacher judgments are in accord as to the importance of various factors that facilitate learning. A supporting illustration is presented.—*T. E. Newland.*

2020. Ferguson, John Bodley. (Cornell U.) Job satisfaction and job performance within a university faculty. *Dissert. Abstr.*, 1961, 21(12), 3843.—*Abstract.*

2021. Fishburn, C. E. (San Diego State Coll.) Teacher role perception in the secondary school. *J. teacher Educ.*, 1962, 13, 55-59.—Roles perceived by teachers and administrators as most important in teachers were in order of importance: mediator of the culture, member of the school community, director of learning, guidance and counseling person, liaison between school and community, and member of a profession. Differences between teachers and administrators were noted.—*E. M. Bower.*

2022. Herbert, Eléonore L. (U. Manchester) The use of group techniques in the training of teachers. *Hum. Relat.*, 1961, 14(3), 251-253.—Young teachers often conceptualize discipline in the classroom in terms of controlling an opposed and hostile class. In terms of group dynamics, however, the students compose a group and the teacher fills the special role of leader within the class group. The dynamics of this relationship are analyzed in terms of Bion's basic assumptions of dependence and flight. Several examples from the author's teaching experience are discussed.—*W. W. Meissner.*

2023. Hernández, Miguelina. (Dept. Education, Puerto Rico) La salud mental del maestro. [Mental health of teachers.] *Educacion*, 1961, 2, 123-135.—The attitudes and causes of satisfactions and frustrations of Puerto Rican teachers were investigated. 60 female and 13 male teachers, ages 20-59, mean age 30 years, were asked to write, anonymously, a short essay on 1 of the following topics: "the greatest satisfactions in my life as a teacher" or "the greatest frustrations in my life as a teacher." The results revealed no sex differences with respect to satisfactions, but male frustrations were much greater than female ones. Urban teachers seem more satisfied than rural ones. The greatest satisfaction (81%) of teachers is to observe academic progress in their children, and the greatest frustrations (38%) are caused by superior authorities. Teachers' salaries (which are considerably lower than American ones) did not emerge as a cause of frustration or dissatisfaction.—*R. E. Morán.*

2024. Oliver, R. A. C., & Butcher, H. J. (U. Manchester) Teachers' attitudes to education. The structure of educational attitudes. *Brit. J. soc. clin. Psychol.*, 1962, 1(1), 56-69.—"Three attitude scales were constructed on the hypothesis that attitudes to education might be partially represented by the dimensions of naturalism, radicalism and tender-mindedness. The development of these scales and their administration to a representative sample of 300 teachers are described, and evidence of their reliability, validity and reproducibility is given. A factor analysis of items from the three scales was carried out. The extent to which this analysis supported the hypothesis of three independent dimensions is discussed."—*C. M. Franks.*

2025. Schneck-Danziger. Ma tsarikh hamore ladaat, min hapsikhologia. [What must a teacher know about psychology?] *Urim*, 1961-62, 19, 144-147.—"In each situation of his professional activity the teacher deals with applied psychology. . . Nevertheless he is not a psychologist." He must not base his work on intuition, but he has to acquire some basic knowledge on the following topics: developmental psychology; the child's school maturity; his interests, needs, and conflicts; psychology of learning and its disturbances; sociometry; teacher's psychology; and

his relations with parents and children. For these purposes a textbook of educational psychology is needed as well as observation of children.—*H. Ormian.*

INDUSTRIAL & MILITARY PSYCHOLOGY

2026. Barabantsschikov, A. V., D'yachenko, M. I., Zaporozhets, A. V., Fedanko, N. F. Vazhnyĭ shag na puti razitiya psikhologii voĭnskoĭ deyatel'nosti. [An important step toward development of a psychology of military activity.] *Vop. Psikhol.*, 1961, 7(6), 179-182.—A review of a book on military psychology by G. D. Lukova entitled *Psikhologiya (Ocherki po voprosam obucheniya i vospitaniya sobetskikh voĭnov)* [Psychology (Sketches on the problems of training and education of Soviet fighting men)], Moscow, Military Publishing House, 1960.—*H. Pick.*

2027. Corsini, Raymond J., Shaw, Malcom, & Blake, R. R. Role playing in business and industry. New York: Free Press Glencoe, 1961. 246 p. \$6.00.

2028. Durand, Claude. Conséquences de la modernisation sur l'évolution des relations de travail. [The effect of modernization on work relationships.] *J. Psychol. norm. pathol.*, 1960, 57(2), 177-192.—Changes in the worker's relationship to his work, his co-workers, and management are traced through several stages of industrial development in the steel mill. At the earliest stage a given product results from the cooperative work of a small hierarchically organized group whose foreman is an expert. The assembly line represents an intermediate stage, in which the range of operations for any worker is limited and there is a premium on speed and accuracy. Finally, with the advent of automation, the worker becomes a push-button technician. Changes in the worker's role are accompanied by changes in his problems, value, and aspirations.—*M. L. Simmel.*

2029. Feinberg, M. R., & Lefkowitz, J. (City College, New York) Image of industrial psychology among corporate executives. *Amer. Psychologist*, 1962, 17, 109-111.—89 executives attending a 1960 executive seminar of the American Management Association completed a 13 item questionnaire. "Almost twice as many executives stated that they would hire an industrial psychologist as compared with those who would decide against such a decision. . . . There are many executives still unconvinced that industrial psychology has any real worth at its present stage of development. . . . The areas of competence in which the industrial psychologist was judged to be most useful were morale, selection and training."—*S. J. Lachman.*

2030. Fleishman, Edwin A. (Ed.) (Yale U.) Studies in personnel and industrial psychology. Homewood, Ill.: Dorsey, 1961. xi, 633 p. \$9.35.—A basic or supplementary text. The introductory material points up the relevance of each article to current issues in the field as well as to the theme of each of the 9 major sections: personnel selection; performance appraisal; training employees and managers; motivation, attitudes, and morale; leadership and supervision; communication and organizational behavior; fatigue, monotony, and working conditions, accidents and safety; and, engineering psychology.

Of the 66 articles, 55 were originally published since 1950.—*C. F. X. Youngberg.*

2031. Siegel, Laurence. (Miami U.) Industrial psychology. Homewood, Ill.: Irwin, 1962. xvi, 414 p. \$6.95.—An elementary text in industrial psychology providing "an overview of industrial psychology, broadly conceived. . . . A background in Introductory Psychology . . . [is] probably helpful . . . but is not indispensable." Areas covered are: selecting, placing, and training employees; worker efficiency; organizational management; consumer behavior.—*E. Q. Miller.*

VOCATIONAL GUIDANCE & APPTITUDES

2033. McDaniel, Myra L. (Army Medical Center, Washington, D. C.) Words are responsibilities. *Amer. J. occup. Ther.*, 1962, 16(2), 57-60.—Some fundamental aspects of communication as they effect the occupational therapist in meeting professional responsibilities are discussed.—*M. A. Seidenfeld.*

2034. Peck, Jean Blackman. (U. Nebraska Medical Coll.) Development and management of transference: Occupational therapists use of self. *Amer. J. occup. Ther.*, 1962, 16(2), 78-83.—The significance of transference as a factor in the treatment relationships of the occupational therapist.—*M. A. Seidenfeld.*

2035. Pickett, Barbara Jean. (Colorado State U.) Factors influencing choice of occupational therapy as a career: Implications for recruitment of students. *Amer. J. occup. Ther.*, 1962, 16(2), 84-88.—The result of a study of 306 students enrolled in 26 occupational therapy curricula are reported. It was found that: (a) the age range for selection of occupational therapy as a career was 16-46 years with the median at 24 years; (b) the majority appeared to have had some contact with occupational therapy either directly or indirectly; and (c) the majority of students first learned about occupational therapy through some form of personal contact, through an occupational therapist, a vocational counselor, mass media, or recruitment literature, in that order, with the first having been responsible for virtually 78% of the initial interest. The principle motivating factors for entering the profession are the opportunities to work directly with people and secondly to help the disabled.—*M. A. Seidenfeld.*

2036. Rusalem, Herbert, & Dill, Seymour. (Industrial Home Blind, Brooklyn, N. Y.) Vocational rehabilitation of the older disabled person. *J. Rehabil.*, 1961, 27(6), 19-20, 35, 38.—A description of the Federation Employment and Guidance Service program, illustrated by 2 case studies. The authors deal with the feasibility of offering vocational rehabilitation to the older disabled client. They point out the important values to be gained from workshop evaluation, counseling, training, and placement offered through such a program. They emphasize that more of such services should be offered.—*M. A. Seidenfeld.*

2037. Stephenson, Richard R. (U. Iowa) Chance versus nonchance scores on the SVIB. *J. appl. Psychol.*, 1961, 45(6), 415-419.—In the interpretation of scores obtained on the Strong Voca-

tional Interest Blank, should those falling in the shaded or chance area be disregarded? Ss were 242 low ability college students and 109 noncollege Ss. These data were obtained from studies by King (see 31: 1540) and Powers (see 31: 6225). Scores falling in the shaded areas are no more due to chance than those falling anywhere else.—*J. W. Russell.*

2038. Super, D. E., & Crites, J. O. *Appraising vocational fitness.* New York: Harper, 1962. xv, 688 p. \$8.75.—This is a revision of the book with the same title which appeared in 1949. The 22 chapters discuss testing, appraisal, prediction, administration, scoring, statistics, aptitudes, talents, and the preparation of test reports. 3 appendices present illustrative cases in appraisal and follow up as well as a listing of test publishers and scoring services. There are author, test, subject, and occupational indexes.—*J. L. Walker.*

OCCUPATIONAL & CAREER INFORMATION

2039. Bornemann, Ernst, & Böttcher, Hans. *Der Jugendliche im Betrieb.* [Youth between 15 and 24 in industry.] *Psychol. Rdsch.*, 1962, 13(2), 77-103.—An outline of the situation in German-speaking countries is given, followed by an investigation of industry's role as an educational institution. The possible dangers for physical and psychological development of employing youth in industry are pointed out. (85 ref.)—*W. J. Koppitz.*

2040. Harding, F. D., & Naurath, D. A. (Lackland AFB, Tex.) *Effects of job experience and organization on the rating of tasks.* *Engng. industr. Psychol.*, 1960, 2, 63-68.—With the expanding use of automated equipment, efficient methods of collecting information about rapidly changing jobs are needed. A card-sort method is explained, including the need for further improvements. Caution should be exercised in grouping pieces of job information from different departments or from widely different types of workers.—*C. F. X. Youngberg.*

2041. Hilton, Thomas L., & Dill, William R. (Carnegie Inst. Technology) *Salary growth as a criterion of career progress.* *J. appl. Psychol.*, 1962, 46, 153-158.—As a possible improvement on absolute salary as a criterion, the authors computed the annual percentage growth of the salaries of 143 engineering graduates employed in industry. Although 1st-year salaries increased markedly from 1950 to 1955, and 1957 salaries varied with years of the service, the growth rates were homogeneous. The rates for different professional groups were different. 1st-year salary and salary growth were unrelated. Growth was related to academic grades, but absolute salary unexpectedly had a stronger relationship. Salary growth has some useful properties, but it is not uniformly applicable.—*Journal abstract.*

2042. Simpson, Richard L., & Simpson, Ida H. *Social origins, occupational advice, occupational values, and work careers.* *Soc. Forces*, 1962, 40(3), 264-271.—380 interviews indicate that "workers who received advice from numerous sources, whose main advisers were outside their families, and who had positive orientations to work were relatively likely to obtain high-status first jobs. These relationships were to some extent independent of each other and of workers' class backgrounds, and for the most part they also applied to the workers' choice of their most

recent jobs. However, workers' advice-seeking and values when they chose their first jobs were not related to their later job histories. The findings are examined in the light of alternative theories of occupational choice."—*A. R. Howard.*

SELECTION, PLACEMENT, APPRAISAL

2043. Biäsch, Hans. *Zum Problem der Auslese und Eignungsbestimmung von Führungskräften.* [The problem of selection and psychodiagnostics of management personnel.] *Psychol. Rdsch.*, 1962, 13, 104-116.—The problem of selection is seen from 3 aspects: (a) the psychological problem of selection and advancement of suitable persons, (b) the sociological problem of evaluating the management situation, and (c) the initiation of those processes which lead to an efficient interaction between manager and situation.—*W. J. Koppitz.*

2044. Bouisset, S., & Monod, H. *Comparaison d'un test morphologique (Pignet) et de deux tests physiologiques d'aptitude fonctionnelle (Ruffier et Step-Test).* [Comparison of a morphological test (Pignet) with two tests of functional physiological aptitude. (Ruffier and Step-Test).] *Travail hum.*, 1961, 24(3-4), 213-224.—An experimental study on 100 firefighters compared Pignet's morphological index to 2 tests of cardiovascular effort aptitude. Correlations were weak, not only with these measures, but with age, weight, and height.—*R. W. Husband.*

2045. Crockett, Harry Jennings, Jr. (U. Michigan) *Achievement motivation and occupational mobility in the United States.* *Dissert. Abstr.*, 1961, 21(12), 3871-3872.—*Abstract.*

2046. Crookes, T. G., & French, J. G. (St. John's Hosp., Aylesbury) *Intelligence and wastage of student mental nurses.* *Occup. Psychol.*, 1961, 35(3), 149-154.—All student nurses recruited since 1952 (102 girls, 34 men; many from overseas) were given the Raven's Progressive Matrices test. Scores correlated "quite highly with examination success, but not at all with eventual completion of the course." The findings were discussed in relation to general problems of occupational selection and nursing recruitment.—*M. York.*

2047. Ehlers, T. (Lübecker Str. 2a, Bremen, Germany) *Über den Vorhersagewert einiger psychologischer Untersuchungsverfahren.* [The predictive value of certain apprentice characteristics.] *Psychol. u. Praxis*, 1961, 5, 157-163.—51 metalworker apprentices, selected from 213 on the basis of high performance ratings, were tested. 4 types of tests (mechanical-technical, space relations, wire-bending, and creativeness), an average of all the tests, and a work performance rating served as the predictive variables. Instructor ratings after 1 and 3 months, an average of 4 school examinations over a period of 1½ years, and an over-all school grade served as criterion variables. It was found that both test scores and work performance ratings were significantly related to school performance criteria.—*H. Roemmich.*

2048. Jaiswal, M. P., Leonard, L. L., Marks, A. R., & Zappin, T. G. (Ohio U.) *Observations on the use of psychological tests in the U. S. A.* *Indian J. Psychol.*, 1961, 36(3), 105-117.—Selected tests and inventories commonly used for selection and appraisal in business and industry in the United

States are discussed, with notes on their validity, reliability, utility, and interpretation.—J. T. Cowles.

2049. Kalikinskii, YU. A. (Akad. Pedagogicheskikh Nauk RSFSR, Moscow) *Nekotorye osobennosti sylkha spetsialistov po tekhnicheskomu oslushivaniyu dvigatelei vnutrennego sgoraniya*. [Some characteristics of hearing of specialists in technical inspection of internal combustion engines.] *Vop. Psikhol.*, 1961, No. 7, 121-134.—Sensitivity to noise patterns and changes is characteristic of some technical workers and serves the very useful function of enabling them to hear when machinery is operating properly and when something is amiss. A battery of 3 auditory tests was given to a group of specialists with this ability, a group of specialists without this ability, and a group of nonspecialists. The 1st specialists had very nearly the same thresholds of loudness sensitivity in both the quiet and noise backgrounds. The other groups displayed a great difference in thresholds. The 1st group of specialists also had high sensitivity to a narrow zone of sound—200-1600 cps with a loudness of 100-110 db. Sounds of engines were recorded at various speeds and with various malfunctions (e.g., knocking of a piston ring or connecting rod.) The 3 groups were asked to identify these sounds with and without extraneous background noise. The 1st group of specialists had a large percentage of the answers correct. The 2nd group of specialists did only moderately well and were bothered to a greater extent by background noise. The nonspecialists were completely unable to handle the task. It was found that naive Ss could become specialists without direct training in the complex task, i.e., by training in the discrimination of the various qualities (pulsation, timbre, and loudness) of noise that differentiate the several noise patterns. (47 item bibliogr.)—H. Pick.

2050. Magee, Richard H. (Helene Curtis Industries, Inc., Chicago) *The employment interview: Techniques of questioning*. *Personnel J.*, 1962, 41 (5), 241-245.—Some common errors in questioning during employment interviews are discussed. Examples are given of good questions for obtaining such information as how the applicant feels about people and about his present job. Constructive use of silence is explained.—M. B. Mitchell.

2051. Marsh, S. H. *Validating the selection of deputy sheriffs*. *Publ. Personnel Rev.*, 1962, 23 (1), 41-44.—The predictor of success in entry-level law enforcement positions included elements of "personality" and "interest" tests, automobile accident rate, height, occupational background, and achievement in "Recruit School." The Ss were 619 men appointed deputy sheriffs between 1947-50 in the Los Angeles area. Criterion ratings were found to correlate significantly with experience of ratee and rater's observation time. Previous occupations of a promotional nature (viz., public relations, insurance, real estate sales, etc.) were related to success to a greater extent than listings such as retail clerk and police and fireman experience.—M. York.

2052. Merenda, P. F., Musiker, H. R., & Clarke, W. V. (W. V. Clarke Associates, East Providence, R. I.) *Relation of self-concept to success in sales management*. *Engng. industr. Psychol.*, 1960, 2, 69-77.—Results of the Activity Vector Analysis were examined for 29 "more" successful and 29 "less" suc-

cessful sales managers. The former men scored higher on the degree of congruence between their social selves and basic selves than did the less successful group. They also had higher relative scores on a sociability factor. It is believed that successful job behavior requires agreement within the individual as to perceived job role and basic self-concept.—C. F. X. Youngberg.

2053. Merenda, Peter F., Clarke, Walter V., & Hall, Charles E. (Walter V. Clarke Associates) *Cross-validity of procedures for selecting life insurance salesmen*. *J. appl. Psychol.*, 45 (6), 376-380.—(See 34: 8503) Ss were 535 financed life insurance agents. A self-concept personality assessment inventory (the Activity Vector Analysis [AVA]), 5 personal-social history items; and age were the predictors used in the study. The criteria were standards for successful and unsuccessful salesmen. "Combining AVA and personal history data enhances the predictive efficiency of these measures in determining success or failure of life insurance agents over a sustained period of time."—J. W. Russell.

2054. Mullins, Cecil J., & Force, Ronald C. (Lackland AFB, Tex.) *Rater accuracy as a generalized ability*. *J. appl. Psychol.*, 1962, 46, 191-193.—To see if those people who can most accurately estimate their peers' performance on an objective criterion are also those who can most accurately rate their peers on carefulness, 236 basic airmen estimated the scores their peers made on a vocabulary test. Then they rated their peers on carefulness, and all Ss took 5 carefulness tests. All 5 of the carefulness tests correlated higher with the ratings assigned by airmen who most accurately estimated their peers' vocabulary scores than they did with ratings assigned by the airmen who least accurately estimated their peers' vocabulary scores. These results were interpreted as a demonstration of the generalizability of rating accuracy.—*Journal abstract*.

2055. Mullins, Cecil J., & Groves, Kenneth J. (6570th Personnel Research Lab.) *A preliminary attempt to identify officers with scientific and engineering potential*. *USAF Personnel Res. Lab. tech. data Rep.*, 1962, No. 62-1, 7 p.—As part of an overall attempt to identify young officers who are good prospects for research and development work, this study investigates predictors of ratings and grades achieved by student officers attending the Squadron Officer School. Predictors included American Council on Education examinations, Educational Test Service tests, 11 variables descriptive of educational background, and 9 scores derived from 3 experimental questionnaires. Criteria were a composite school grade and instructor ratings of officership, originality and creativeness, and logical reasoning. Multiple regression analyses revealed that prediction of all criteria except the logical reasoning rating were slightly improved by adding the self-report variables to the academic predictors. Relative merits of the various predictors are considered, both as predictors of the school criteria and as possible predictors of R & D proficiency criteria.—*USAF PRL*.

2056. Nix, Harold L., & Bates, Frederick L. (Georgia State Coll.) *Occupational role stresses: A structural approach*. *Rural Sociol.*, 1962, 27 (1), 7-17.—Data from a review of the literature and from 27 4-hour interviews with vocational agriculture

teachers led to a description of occupational role stresses and the reasons for the results of, and the adjustment to their occurrence.—H. K. Moore.

2057. Perloe, S. I. (Haverford Coll.) **Status and the judgment of occupational prestige.** *J. abnorm. soc. Psychol.*, 1961, 63(3), 671-674.—"A test was made of the hypothesis that high status subjects would displace their judgments of moderate and low prestige occupations towards the low end of the prestige dimension. A comparison of the judgments of Yale students and previously published judgments of a nationwide sample supported the hypothesis. The results were attributed to the high status (Yale) subjects using their own actual or expected positions on the occupational prestige dimensions as internal anchors. Two explanations [Helson (1948), Volkman (1951)] of the anchor effect were discussed."—G. Frank.

2058. Souerwine, A. H. (Travelers Insurance Co.) **More value from personnel testing.** *Harv. bus. Rev.*, 1961, 39(2), 123-130.—Although it is important to keep a close watch on the development and maintenance of the mechanical aspects of a testing program, each company should be aware of the possible effects of interdepartmental relations and of its attitudes about people, about objective measures, and about change.—C. F. X. Youngberg.

2059. Sydiaha, Daniel. (U. Saskatchewan) **Bales' interaction process analysis of personnel selection interviews.** *J. appl. Psychol.*, 1961, 45(6), 393-401.—What are the sources of interview unreliability? This is the 2nd of a series of 3 studies of the interview. 276 interviews were used. "Samples of interview conversation (personnel selection interviews) were analyzed according to Bales' interaction process analysis. Scores obtained were correlated with decisions made by interviewers about whether applicants were recommended for acceptance or rejection. . . . specific interaction score variance accounts for interviewer error to a significant degree."—J. W. Russell.

2060. Teel, Kenneth S., & Petersen, Robert L. (Strategic Air Command, Calif.) **A study of test-retest results obtained on aircrew proficiency examinations.** *J. Psychol.*, 1962, 53(2), 289-294.—Analysis of test-retest scores on written proficiency exams for 112 aircrew members revealed a significant increase of 4.82% in mean retest scores, and a significant inverse relationship between amount of improvement and original score. The data were interpreted as suggesting that retest improvement was primarily a function of intervening training and that test security would not be seriously compromised by successive administrations.—Author abstract.

2061. Velehradský A. (Správa dráhy, Plzeň) **Vliv stárnutí na pracovní zařazení.** [Influence of aging on work placement.] *Ceskoslov. Psychol.*, 1961, 5, 337-339.—The author describes problems caused by aging. Psychological care must be used in order to remove the unfavorable influences caused by aging in man's personal life and in his working environment. (Russian & English summaries)—V. Bricháček.

• TRAINING

2062. Alexander, L. T., Kepner, C. H., & Tregoe, B. B. (System Development Corp., Santa Monica,

Calif.) **The effectiveness of knowledge of results in a military system-training program.** *J. appl. Psychol.*, 1962, 46, 202-211.—An experiment to investigate the effects of knowledge of results (KR) on performance improvement of a man-machine, information-processing system. 4 13-man crews were given a pretest exercise, then 12 training exercises, then a posttest exercise in air defense operations using their own operational equipment and a simulated air environment. 2 experimental crews received KR at a postexercise debriefing; 2 control crews received no KR or debriefing. The experimental crews improved more than the control crews in all but one function, but improvement across functions was not equivalent. An inverse relationship was discovered between the operational visibility of a function and amount of improvement when postexercise KR was held constant. Visibility is discussed in its role as an information-feedback concept in system design and system training.—Journal abstract.

2063. Baker, R. C., & Siegel, A. I. **Training requirements for civil defense administrators and leaders.** Wayne, Pa.: Applied Psychological Services, 1958. xxv, 243 p.—The results of the "Inquiry for Civil Defense Administrators and Leaders" implied that many Federal Civil Defense Administration (FCDA) trained personnel are not being maximally utilized on the job. Also implicit in the findings was the fact that local civil defense organizations tend to be under the jurisdiction of officials who have a minimum of FCDA Administration Course training.—P. Federman.

2064. Bonnardel, R. **Evolution des capacités d'une population de jeunes gens candidats à une école d'apprentissage industrielle.** [Development capacities of a population of young applicants for a school of industrial training.] *Travail hum.*, 1961, 24, 243-247.—Test scores of apprentices across 17 years were studied. There were no significant changes in spatial and perception tests. But there was definite improvement in reasoning, verbal comprehension, arithmetic, and spelling.—R. W. Husband.

2065. Čáp, J. (Charles U., Prague) **Aktuální úkoly naší psychologie y odborném vzdělání učňů.** [Practical tasks of psychology in the technical education of apprentices.] *Ceskoslov. Psychol.*, 1961, 5, 312-318.—A brief survey of practical methodological problems of technical training is given from the psychological point of view. The principal research tasks are analysis of the most important types of working activity, formation of working skills, formation of interests in an occupation, and the attitude toward work. (Russian & English summaries)—V. Bricháček.

2066. Federman, P., & Siegel, A. I. **Training requirements for civil defense administrators and leaders; The Radiological Defense Instructor Course.** Wayne, Pa.: Applied Psychological Services, 1960. xxi, 110 p.—A training evaluation of the Radiological Defense Instructor Course was performed. The major conclusions of this evaluation are: (a) the training is vital in preparing the students for their radiological defense assignments in the advent of another war, (b) all lessons in the course are at least "moderately important" and free from extraneous material, and (c) the course is at the proper difficulty level—it presents some challenge

but is well within the potential of the students.—P. Federman.

2067. Gagne, Robert M. (Princeton U.) **Military training and principles of learning.** *Amer. Psychologist*, 1962, 17, 83-91.—"If I were faced with the problem of improving training, I should not look for much help from the well-known learning principles like reinforcement, distribution of practice, response familiarity, and so on. I should look instead at the technique of task analysis and at the principles of component task achievement, intratask transfer, and the sequencing of subtask learning to find those ideas of greatest usefulness in the design of effective training." Major sections are: Some Representative Military Tasks, Learning, Principles, Using These Assumptions and Principles in Training Design, What Is Applicable to the Design of Training? and Summary.—S. J. Lachman.

2068. McGovney, Warren C. (Evanston, Ill.) **Start at the top.** *Advance. Mgmt.-Off. Exec.*, 1962, 1(2), 11-12.—A practical experience report on starting a management training program at the 1st-line management level. If such training programs are to be effective they must be supported by top management. Poor results and wasted time occur with lack of support, since the reactions of the men in training are likely to be those of fear, suspicion, and resentment toward top management.—E. Q. Miller.

2069. Muckler, Frederick Arthur. (U. Illinois) **Transfer of training with long period oscillatory control system transients.** *Dissert. Abstr.*, 1961, 21(11), 3533.—Abstract.

2070. Petrof, John V. (Atlanta U.) **Higher education and smaller business.** *Advanc. Mgmt.-Off. Exec.*, 1962, 1(4), 30-34.—The results of a survey of 111 colleges indicated that the managerial needs of small business are not being met in higher education. Business schools are concentrating on training persons for middle and top-managerial positions, while other levels are being understressed. Academicians have been overlooking the fact that the small-business man has to cope with broader, over-all problems in management much earlier than does the manager in a larger organization.—E. Q. Miller.

2071. Roscoe, Thomas A. (Alcoa, Tenn.) **Formal or informal development programs.** *Advanc. Mgmt.-Off. Exec.*, 1962, 1(4), 11-14.—A report on a survey made to determine what types of executive training programs are in use and what subjects are included. 46 assorted companies reported 21 topics used in 27 organized programs. Seniority, as opposed to ability, is still a major basis for promotion.—E. Q. Miller.

2072. Schwitter, Joseph P. (Kent State U.) **Training Russian managers.** *Advanc. Mgmt.-Off. Exec.*, 1962, 1(2), 15-22.—Management as a science or a discipline for academic pursuit is not recognized in the Russian educational system. In schools, emphasis is placed on technical competency. How to work with people is then best learned on the job, or in extracurricular activities of various kinds. There is no psychology or sociology in the Russian curriculum. Most of the Russian managers have college degrees in engineering.—E. Q. Miller.

2073. Sharma, Atmananda. (Psychological Research Wing, New Delhi, India) **Improvement through training: A criterion in test validation.**

Def. sci. J., Delhi, 1961, 11(3), 183-190.—This study was undertaken to decide about an adequate criteria which may be adopted in validating aptitude tests used in Naval Training Schools. 3 criteria (final score, residual gain, and crude gain) were compared. The final decision regarding the choice of criterion was primarily based on logical considerations. Residual gain, which measures that aspect of final score which is uncorrelated with initial status and thus removes some of the nonappropriate variance from the criterion and further overcomes the inconsistencies which crude gain presents, was found to be a more realistic criterion.—*Journal abstract.*

TASK & WORK ANALYSIS

2074. Belanger, Pierre R. **Time-varying characteristics of the human operator in an open loop.** *USAF ESD tech. docum. Rep.*, 1962, No. 62-31. v, 51 p.—This study utilizes the classical theory of time-varying networks, due to Zadeh, to describe randomly time-varying characteristics of the human operator of a control system. The present technique extends previous work on time varying characteristics of human operators in that the complete spectra of amplitude and phase modulation can be measured. The method is applied to the performance of the human operator in tracking tasks without visual feedback. The human is required to track a random appearing target which is displaced as the sum of 5 nonharmonic sinusoids. The effects of various gains and dynamics of the controlled process are investigated. An estimate is given of the magnitudes and spectra of the time variation, though insufficient data were available in the present experiments for complete determination of the modulation spectra. The human's transfer function is found to vary randomly in time. The average open-loop characteristics show that with no dynamics in cascade with the human, the latter has more difficulty remembering the proper gain than the proper phase which he must apply in order to track accurately. When dynamics are introduced, it is seen that the human tends to forget the effects that the dynamics produced when tracking with feedback.—*Journal abstract.*

2075. Folley, John D., Jr. (American Inst. Research) **A preliminary procedure for systematically designing performance aids.** *USAF ASD tech. Rep.*, 1961, No. 61-550. 34 p.—Performance aids are devices or documents that facilitate task performance by humans in a system. These supplementary aids to performance can enhance the overall quality of a system by assisting in achievement of more nearly optimal man-machine function allocation, by reducing the level of requirements on selection, training, and manning, or by raising on-the-job performance levels. 4 steps in the design of performance aids are presented: (1) identification of task elements for which aids should be provided; (2) determination of appropriate functional characteristics of aids for these task elements; (3) specification of the physical design characteristics of the aids to carry out the functions; and (4) evaluation, modification, and updating of the aids. Supplementary data on capabilities of performance aids are presented for use with the procedure. The procedure is untried and of necessity uses stopgap solutions to problems on which much research or development is needed.—*USAF ASD.*

2076. Folley, John D., Jr., & Munger, Sara J. (American Inst. Research) **A review of the literature on design of informational job performance aids.** *USAF ASD tech. Rep.*, 1961, No. 61-549. 43 p.—Performance aids are items of auxiliary equipment or documents provided to enhance on-the-job performance. Military reports and psychological journals were surveyed to identify reports of research on the design of performance aids. Most research on this topic was done prior to 1958. No studies attempted to identify the significant variables in this design of aids. The preponderance of the work was concerned with developing and trying sample aids. Several studies indicated that procedural aids can facilitate trouble-shooting performance. The extent to which other kinds of aids can facilitate performance of other kinds of tasks is unknown. (Annotated bibliogr.)—*USAF ASD*.

2077. Heron, Alastair. (U. Liverpool) **Immediate memory in dialling performance with and without simple rehearsal.** *Quart. J. exp. Psychol.*, 1962, 14, 94-103.—"Using a Latin square design, subjects were required to dial 10 8-digit messages in each of 6 conditions (3 with auditory and 3 with visual presentation). Dialling was carried out (1) immediately the message had been presented; (2) after it had been once vocally rehearsed by the subject; (3) after it had been written down while being vocally rehearsed. A complete record was obtained of all performances, at rehearsal and at dialling. It was found that with auditory serial presentation, immediate vocal rehearsal and immediate dialling are equally good and both superior to dialling which followed vocal rehearsal. With visual simultaneous presentation, immediate vocal rehearsal is clearly superior to dialling with or without rehearsal, which do not differ. Performance after written-down rehearsal was the worst in both modes of presentation. A non-linear relationship between intelligence and performance was found, and acute individual differences in performance were observed among the subject of the highest intelligence."—*E. Y. Borrowman*.

2078. Iteľ'son, L. B. (Azerbaijani Pedagogical Inst., Baku) **O psikhologicheskikh osobennostyakh truda apparatchika v nepreryvnom khimicheskom proizvodstve.** [On the psychological characteristics of the work of technicians in chemical production.] *Vop. Psikhol.*, 1961, 7(5), 109-120.—A job analysis is presented of an operator's work in directing the refinement of oil. The activities that an operator performs involve a constant registering of information and controlling of the production process, an accounting of the product coming out, planning of the subsequent output, directing and regulating the process to correspond to changes in products demanded, and the service of equipment and organization of work. Special analysis is made of the procedures used by operators to handle the large amount of information with which they are continuously presented, and their techniques for handling deviations from normal operating states. Information strain is reduced by attending only to the more important signals, by noting the position of pointers relative to normal (rather than absolute values), by successive scanning of indicators, and by anticipating from previous indications the state of the various displays. Deviations from normal conditions are handled by various procedures typified by (a) correcting on the basis of

general principles governing the production process or (b) minimizing the possibility of the severest casualties.—*H. Pick*.

2079. Kaufman, R. A., & Kaufmann, M. I. (Aerospace Div., Boeing Aircraft Co., Seattle) **Predicting human factors errors.** *Engng. industr. Psychol.*, 1960, 2, 47-56.—The cost, weight, and volume of a given package are hypothesized as being related to magnitude of human error. After examining weapon system data, combinations of predictors for mechanical and electrical subsystems are formulated. Significant correlations are reported and the rationale for predictor equations explained.—*C. F. X. Youngberg*.

2080. Kidd, J. S., & Kinkade, Robert G. (Ohio State U.) **Operator change-over effects in a complex task.** *J. engng. Psychol.*, 1962, 1, 82-91.—2 related experiments were performed, (a) to study changes in performance of a simulated air traffic control system resulting from operator change-over and a long (3.5-hour) work period, and (b) to evaluate the effects of varying amounts of prechange-over participation in the task. In the 1st experiment performance was found to be relatively stable over the long work period; there was a sharp, short, decrement in performance following a 2-minute orientation period. The 2nd experiment showed that the more nearly the prechange-over orientation resembled the actual task, the less was the performance decrement following change-over.—*D. C. Hodge*.

2081. Mitra, S. K., & Misra, M. M. **Analysis of work with automatic looms.** *Psychol. Stud., Mysore*, 1962, 7(1), 32-51.—5 grades of workers were observed for 450 minutes in 6 units of observation. This resulted in job analysis data. The various characteristics found were: (a) for group leader: perceptual speed, perceptual accuracy, perception of movement, mechanical comprehension, and visual acuity; (b) for weaver: eye-hand coordination, speed of finger and hand movement, finger dexterity, respective hand movement, hand steadiness and precision, physical endurance, and visual acuity; (c) for oiler & cleaner: speed of finger and hand movement, and repetitive hand movement; (d) for battery filler: 2 hand coordination, speed of finger and hand movement, finger dexterity, and repetitive hand movement. Observer data appear in appendix.—*U. Pareek*.

(Calcutta) **The effect of different phases of cutaneous pain and pressure on respiratory systems in reference to normal conditions of muscular activity leading to fatigue.** *Indian J. Psychol.*, 1958, 33, 275-280.—Pneumographic records were taken on 10 male postgraduate students during: periods of rest, muscular work (until complete fatigue was reached), pain and pressure tests. "Respiratory changes in the gradient pain and pressure modalities show marked affinities in the specific phases of work leading up to fatigue."—*E. Y. Beeman*.

2083. Nebilytsyn, V. D. (Inst. Psychology APN RSFSR, Moscow, USSR) **K izucheniyu nadezhnosti raboty cheloveka-operatora v avtomat-izirevannykh sistemakh.** [On the study of reliability of the human-operator in automated systems.] *Vop. Psikhol.*, 1961, 7(6), 9-18.—In a theoretical discussion, reliability is defined as the ability or capacity for preservation of necessary characteristics under

extenuating conditions. It is considered to have both a quantitative and qualitative aspect and is differentiated from effectiveness in that reliability is one of the conditions for effectiveness. Reliability must be determined both for the extreme as well as more normal operating conditions. For human operators failure can be considered to occur both when the organism is incapable of working due to sleep, loss of consciousness, etc., as well as when errors are made. With this in mind certain indices can be used to evaluate reliability such as average time between errors, number of errors per unit time, percent of task completed, probability of errorless performance in a given unit of time. Factors which effect reliability include design of the apparatus, state of training of the personnel, and individual differences in physical and psychological characteristics. These are reflected in such characteristics as long term endurance, endurance in extreme conditions, resistance to distraction, etc. It is suggested that changes in physiological indices which occur under reduced vigilance, e.g., sleep could serve as means of controlling failure.—*H. Pick.*

2084. Office of Naval Research. Tri-Service Conference on the Role of Job Evaluation Techniques in the Structuring of Military Occupations. *Off. Naval Res. Symp. Rep.*, 1961, No. 71, 53 p.—A report of the 4th of a series of 5 conferences. Modern military needs call for increasing numbers of men in managerial, scientific, and high level technical areas; but existing job evaluation techniques were developed primarily for blue collar jobs. Job evaluation research and practices of industry and of the military are reviewed.—*E. L. Borrowman.*

2085. Sadacca, R., Castelnovo, A., & Ranes, J. Human factors studies in image interpretation: The impact of intelligence information furnished interpreters. *USA TAG R & D Command Hum. Factors Res. Br. tech. res. Note*, 1961, No. 117. 23 p.—In the continuation of research concerned with development of techniques to improve performance of image interpreters, 2 closely related studies were undertaken to determine (a) whether additional intelligence information furnished the interpreter influenced his performance with reference to accuracy and speed of reporting or certitude of interpretation and (b) whether performance was differentially affected by officer-enlisted status or class standing in the PI Course. Among interpreters furnished additional intelligence information, a larger proportion were consistently above the median in correct identification of objects in the photographs; this group also reported more objects where actually none appeared. Average confidence levels were apparently not affected by presence or absence of the additional intelligence. Where no additional information was furnished either the experimental or the control group, levels of performance between the groups were comparable. Evidence did not reveal significant differences in performance as affected by either the interpreter's status or class standing or by variations in purported reliability of the intelligence source.—*A. J. Drucker.*

2086. Seibel, R. (IBM Research Center, Yorktown Heights, N. Y.) Performance on a five-finger chord keyboard. *J. appl. Psychol.*, 1962, 46, 165-169.—Discrimination Reaction Times (DRTs) were examined for each of the 31 chords possible with a

5-finger keyboard. Each of 4 paid Ss showed marked improvement in performance over 4000 to 11,000 DRTs on the 31-chord task despite extensive prior practice on subsets of the 31 chords. DRTs between .30 and .35 sec. were obtained for the average of all 31 chords. Information transmitted from stimulus to keyboard was greater than 4.25 bits. In terms of average DRTs, the relative difficulties of the 31 chords were very similar for the 4 Ss. The percentage of error for each of the chords was highly correlated with the DRTs.—*Journal abstract.*

WORK ENVIRONMENT & PERFORMANCE

2087. Chiles, Dean W., & Adams, Oscar S. (Aerospace Medical Lab.) Human performance and the work-rest schedule. *USAF ASD tech. Note*, 1961, No. 61-270. ii, 5 p.—This report contains a condensation of the material most relevant to the problem of work: rest scheduling in advanced aerospace systems. The major conclusions drawn are: (a) periods of wakefulness longer than 24 hours requiring performance of critical tasks are not feasible as a routine procedure; (b) 6 hours of sleep per day are adequate for most individuals; (c) sleep periods should not be less than 2 hours in duration; (d) continuous performance of monotonous tasks by themselves should not exceed 2 hours; (e) performance of active tasks may be extended to 10 hours; (f) total cycle duration (work plus rest) should be 4, 6, 8, or 12 hours in order to permit regular day to day schedules; (g) where stress will be high, schedules no more severe than 2-work: 2-rest (or equivalent) should be used; (h) 7 or 8 days pretesting should be adequate to select persons adaptable to schedule changes; (i) a 5-day pre-adaptation period should be used to overcome initial sleep losses.—*USAF ASD.*

2088. Chisman, James A., & Simon, J. Richard. (State U. Iowa) Protection against impulse-type industrial noise by utilizing the acoustic reflex. *J. appl. Psychol.*, 1961, 45(6), 402-407.—"This experiment was designed to investigate the practicality of externally eliciting the acoustic reflex to protect the ear from industrial impulse noise. Ten subjects were exposed to 100 impacts of the recorded noise of a mechanical drop hammer during a 10-minute period. The noise was presented at a 120-db. average SPL. Subjects listened to the same noise under three conditions. . . . eliciting the acoustic reflex prior to an impact may be an effective means of protecting the ear against industrial impulse noises. The advantages of AR protection over protection provided by earplugs are discussed."—*J. W. Russell.*

2089. Cureton, Edward E., & Katzell, Raymond A. (U. Tennessee) A further analysis of the relations among job performance and situational variables. *J. appl. Psychol.*, 1962, 46, 230.—In connection with an investigation of the relationships among employee attitudes, performance, and characteristics of the situation, data were collected from 72 divisions of a company. The variables included 5 measures of divisional performance and 5 descriptives of situation. An oblique-factor analysis of these variables results in 2 positively correlated factors. The 1st factor is associated negatively with divisional and community size, and positively with productivity and profitability. The 2nd is associated inversely with wage rate, unionization, and proportion of male em-

ployees, and positively with turnover. These results, in combination with some previously reported, indicate that performance is related to 2 aspects of the degree of urbanization of the situation.—*Journal abstract.*

2090. Madden, Joseph M. (Lackland AFB, Tex.) What makes work difficult? *Personnel J.*, 1962, 41(7), 341-344.—Each of 37 Air Force noncommissioned officers filled out 2 forms, one giving 3 tasks that were difficult to learn and one giving 3 tasks that were difficult to perform. In each case, they were asked to tell why they were difficult. The reasons were classified as: pressure; working conditions; attention; interpersonal relations; frustration; training; regulations; technical publications, manuals; forms; aptitude; and unclassified. The most frequent reason for difficulty to perform was classified under interpersonal, indicating difficulty with supervisors or peers. The most frequent reasons for difficulty in learning were inadequate training and lack of aptitude. Most difficulties in doing the work were attributed to the environment and no mention was made of any difficulty due to physical effort.—*M. B. Mitchell.*

2091. Ormiston, Donald W., & Finkelstein, Beatrice. (Behavioral Sciences Lab.) The effects of confinement on intellectual and perceptual functioning. *USAF ASD tech. Rep.*, 1961, No. 61-577. 16 p.—10 Ss were individually confined in a small capsule for 48 hours and required to work intermittently on intellectual, perceptual, and compensatory tracking tasks. $\frac{1}{2}$ of the Ss received conventional meals. The other $\frac{1}{2}$ were provided a diet designed for consumption in a space vehicle. The normal cycle of sleep and wakefulness was maintained throughout the confinement period. 10 control Ss underwent the same conditions except they were confined only while eating or working. Intellectual tasks were: arithmetic, digit memory, confusing sentences, nonsense syllables, verbal analogies, same-opposite word meanings, and logical reasoning. The perceptual tasks were: warning-light monitoring, finding embedded figures, form discrimination, and aerial reconnaissance. No decrement was observed in intellectual performance.—*USAF ASD.*

2092. Richardson, F. L. W. Talk, work, and action. *Soc. Appl. Anthropol. Monogr.*, 1961, No. 3. 96 p.—This case study, in an industrial setting, analyzes reactions of a work group following the replacement of the group's supervisor. It examines the direct and immediate interconnections between the emotions and interactions of the group. 3 major indices of emotional reaction are investigated: verbal sentiments (talk), group productivity (work), and signs of withdrawal or aggression (action). 7 suggestions for action to improve human environments are presented for consideration.—*G. M. Spencer.*

MOTIVATION, ATTITUDES, TRAITS

2093. Adams, J. Stacy, & Rosenbaum, William B. (General Electric Co., NYC) The relationship of worker productivity to cognitive dissonance about wage inequities. *J. appl. Psychol.*, 1962, 46, 161-164.—2 hypotheses derived from dissonance theory were tested: (a) When a person is paid by the hour his productivity will be greater when he perceives his pay as inequitably large than when identical pay is perceived as equitable, and (b) when a person is paid

on a piecework basis his productivity will be less when he perceives his pay as inequitably large than when he perceives identical pay as being equitable. The first hypothesis was sustained ($p < .05$) in a laboratory experiment in which 11 male college Ss earned \$3.50 per hour and were induced to feel overpaid and 11 control Ss earned \$3.50 per hour and were induced to feel fairly paid. The second hypothesis was sustained ($p < .01$) in a factorial design study in which 36 Ss were paid either \$3.50 per hour or 30 cents per piece, and felt either equitably paid or inequitably overpaid. In both studies an identical task, in which Ss interviewed the general public, was used.—*Journal abstract.*

2094. Aseev, V. G. (Inst. Psychology APN, RSFSR Moscow, USSR) K voprosu o monotonnosti raboty pri vypolnenii konveynnykh operatsii. [On the question of the monotony of work in the execution of conveyor operation.] *Vop. Psikh.*, 1961, 7(6), 37-55.—The present study was designed to discover some objective indicators of monotonous work and to establish what objective, temporal, and structural properties of work on conveyor lines are less likely to lead to monotony. As indices of monotonous work, reaction time for a simple motor response and critical fusion frequency were tried. On test trials with workers performing monotonous conveyor tasks these indices were found to change in contrast with workers at the same factory who were performing nonconveyor type operations. Over the working day the assembly line workers showed an increase in reaction time and a greater variability of reaction time. The critical fusion frequency decreased for these workers. The indices for the other workers remained essentially constant. Then a series of experiments were carried out with conveyor type workers in 3 factories and a mock up assembly line in the laboratory. In the case of the factory workers the temporal and operational characteristics of the work were correlated with the above indices of monotony. In the case of the laboratory experiments the characteristics of the task were directly manipulated. Results suggest that the arousal of monotony does not always depend just on the duration of each operation and its uniformity. Such factors as rhythm of work, micropauses during the operation, and social organization of the work also play a role.—*H. Pick.*

2096. Bose, S. K. (Bangalore) Industrial motivation for higher production. *Indian J. Psychol.*, 1958, 33(4), 237-247.—A discussion of factors influencing employee morale.—*E. Y. Beeman.*

2097. Campbell, David. (U. Minnesota) The use of response patterns to improve item scoring. *J. appl. Psychol.*, 1962, 46, 194-197.—This study compared the validity of 2 methods of scoring the Minnesota Vocational Interest Inventory. One method used keys developed in the usual manner by selecting items that differentiated between specific occupational groups and a reference group of tradesmen-in-general. The other method used keys developed by selecting items that were part of response patterns that differentiated between criterion and reference groups. 3 occupational keys were developed and cross-validated: painter, printer, and electrician. Results showed that

the keys were about equal in their ability to separate criterion from reference groups, but the key developed from response patterns used far fewer items.—*Journal abstract*.

2098. Cleland, C. C., Cochran, W. E., Love, J. G., & Vowell, R. W. (Abilene State School) **The "Hawthorne effect" in an institution in transition.** *Amer. J. ment. Defic.*, 1962, 66(5), 723-728.—Unlike the Hawthorne investigations with only 5 workers, this study trained large groups of institutional workers. In the 1st phase, attempts were made to change large groups' attitudes rapidly. In the 2nd phase, the focus of attention was a group of 11 individuals charged with supervisory and administrative responsibilities. The 3rd phase involved the creation of an example as a possible goal for others to emulate. This phase came closest to the results achieved in the Hawthorne study. Attention on a systematic basis from top management produced the desired results. The authors point out that an institution in transition encounters problems which demand a systematic approach.—*V. Staudt-Sexton*.

2099. Coleman, C. J. (National Drug Co., Philadelphia, Pa.) **A basic program for employee development.** *Personnel*, 1962, 39(2), 17-25.—Emphasis is given to the fact that development can take place only in a climate that fosters individual growth. Conscious effort and planning are required to create such a climate. A sound managerial approach is necessary.—*V. Staudt-Sexton*.

2100. Crockett, Harry J., Jr. (U. North Carolina) **The achievement motive and differential occupational mobility in the United States.** *Amer. sociol. Rev.*, 1962, 27(2), 191-204.—TAT responses from a national sample of 175 males were scored for achievement motivation in order to determine the relation between the strength of this motive and intergenerational occupational mobility in the United States. "Atkinson's theory of achievement motivation, shown to be relevant to the study of occupational mobility, predicts that strength of achievement motive—among persons sharing equal opportunity—will be positively correlated with upward occupational mobility and negatively associated with downward occupational mobility. In the national sample studied, the expected results are clearly obtained with regard to upward mobility among persons reared in the lower social strata, but predicted relationships are not found among persons reared in the middle and upper strata. The hypothesis concerning strength of achievement motive and downward mobility is not supported. The results indicate the fruitfulness of considering personality variables in conjunction with social structure variables in the study of occupational mobility."—*L. Berkowitz*.

2101. Form, William H., & Geschwender, J. A. (Michigan State U.) **Social reference basis of job satisfaction: The case of manual workers.** *Amer. sociol. Rev.*, 1962, 27, 228-237.—545 interviews (1950-51) with manual workers in Lansing, Michigan, demonstrated the utility of reference group theory for the study of job satisfactions. Some of the findings were: (a) "almost four fifths of the respondents reported that their parents had no occupational aspirations for them," perhaps because the parents saw little likelihood of occupational mobility; (b) upwardly mobile sons, "those who achieved an occupational level higher than their fathers, exhibited

a significantly higher mean job satisfaction score than did sons who were downwardly mobile"; (c) workers who achieve a higher occupational level than that of their brother exhibit a significantly higher mean job satisfaction score than those whose occupational level is equal to that of their brother. Other results suggest that manual workers "use those of similar origin as social references in evaluating their occupational achievements."—*L. Berkowitz*.

2102. Gordon, Leonard V., & Alf, Edward F. (USN Personnel Research Activity, San Diego) **The predictive validity of measured interest for Navy vocational training.** *J. appl. Psychol.*, 1962, 46, 212-219.—An experimental interest test, yielding scores on 5 homogeneous scales, was administered to a sample of recruits on their 3rd day in the Navy. Recruits were assigned to Naval school training, on the basis of expressed interest and aptitude test scores, by classification personnel who did not have access to interest test scores. Follow-up results are reported for 19,147 recruits assigned to 51 schools, each of which had a related scale on the interest test. For students in each of the 51 schools, the mean score on the related interest scale was significantly higher than the corresponding mean score for the general recruit population. For 41 schools, the related interest scales had statistically significant predictive validity against a school grade criterion. Related interest scales contributed significantly to operational aptitude tests in predicting school success.—*Journal abstract*.

2103. Harding, Francis D., & Bottenberg, Robert A. (Personnel Lab., Lackland AFB) **Effect of personal characteristics on relationships between attitudes and job performance.** *J. appl. Psychol.*, 1961, 45(6), 428-430.—Using 376 airmen, Whitlock and Cureton (see 35: 7252) collected attitude score and biographical data, which is reanalysed in the present study, using multiple regression techniques. "... much of the criterion variance associated with attitude measures is also related to more easily obtained biographical characteristics of workers and biographical variables should be considered when relating attitudes to productivity."—*J. W. Russell*.

2104. Herman, Louis M., Lindsay, Carl A., & Zeigler, Martin L. (Pennsylvania State U.) **A vocational interest scale for biologists.** *J. appl. Psychol.*, 1962, 46, 170-174.—A Biologist scale for the SVIB (Form M) was developed following procedures outlined by E. K. Strong, Jr. 4 groups were employed: (a) criterion (N=251) systematically selected from Volume 2 of *American Men of Science*, (b) cross-validation (N=89) selected at an American Institute of Biological Science convention, (c) 2 concurrent validation groups (Ns=121, 306) selected from the Pennsylvania State University student body. Results indicated that the scale differentiated the interests of: (a) the biologists from Strong's men-in-general group (P₁), (b) the biologists from the interests measured by 36 other SVIB scales, (c) the concurrent validation groups in the expected direction. Reliabilities of .88 (criterion) and .87 (cross-validation) were obtained. It was concluded that the scale has sufficient validity and reliability to be a useful counseling device.—*Journal abstract*.

2105. Huse, Edgar F., & Taylor, Erwin K. (Raytheon Co., Boston, Mass.) **Reliability of absence measures.** *J. appl. Psychol.*, 1962, 46, 159-160.—4 different absence measures were defined and

examined: attitudinal absences, absence frequency, absence severity, and medical absences. Attitudinal absences and absence frequency were sufficiently reliable to be used as criterion measures; absence severity and medical absences were considered to be too unreliable for use as criterion measures.—*Journal abstract.*

2106. Kinnane, Mary. (Boston Coll.) **Attitudes of college students toward college teaching as a career.** *Educ. Rec.*, 1962, 43(2), 139-147.—A questionnaire was administered to nearly 4000 students in 45 New England colleges and universities to determine their attitudes toward college teaching as a career. Attitudes seem to be governed by low teacher's salaries and the plenitude of job opportunities. In general, high regard for their own mentors and for teaching as a career was reflected in the responses.—*W. W. Meissner.*

2107. Larrue, Janine. **Activité militante et loisir.** [Labor union activity and leisure] *J. Psychol. norm. pathol.*, 1961, 58(3), 291-308.—A study of leisure time activity of general factory workers, former union officials, and workers currently holding offices in their labor union. The latter constitute 14% of the total and tend to be single, relatively young, and better educated than the group as a whole. Union officers have less free time, since they spend evenings and often Saturdays on union business, but spend their leisure time more productively, e.g., reading, theater attendance, etc.—*M. L. Simmel.*

2108. Levandouskii, N. G. (Lab. Industrial Psychology, Leningrad U.) **Otnoshenie kak faktor psikhicheskoi regulatsii deistvii.** [Attitude as a factor in mental regulation of behavior.] *Vop. Psikh.*, 1961, No. 5, 135-142.—The regulation of the behavior of man and machine is discussed; and the point is made that along with the more objective conditions of the task, the attitude of man plays an important role in his regulation of his behavior. Some reaction time data are analyzed to indicate that a trained specialist may not do as well on a very simple task but may do better on a more complex task than a naive S. The specialist's poor performance is attributed to his poor attitude when confronted with a simple task.—*H. Pick.*

2109. Mendelson, Martin A. (New York U.) **Personality and interests of Air Force personnel.** *Dissert. Abstr.*, 1961, 21(12), 3844-3845.—*Abstract.*

2110. More, Douglas M. (Nicholson-Kohn & Associates, St. Louis) **Demotion.** *Soc. Probl.*, 1962, 9(3), 213-221.—An attempt is made to lay out a scheme of the forms of demotion observed in a wide range of United States businesses; to indicate the conditions which increase the likelihood of demotion being used as a business process; and to analyze the consequences of demotion on the individuals demoted and on the company organizations in which this takes place. Specific effects of demotion on the behavior of individuals directly or indirectly involved are, among others, decreased individual productivity, decreased creative efforts, loss of loyalty, increased chronic illness, increase in abuse of privileges, moonlighting, formation of protective power cliques, and other symptoms of loss of morale. Demotion is seen as an important instance of downward social and occupational mobility warranting serious further research.—*R. M. Frumkin.*

2111. Pearlin, L. I. (National Inst. Mental Health) **Alienation from work: A study of nursing personnel.** *Amer. sociol. Rev.*, 1962, 27(3), 314-326.—"Alienation, defined as subjectively experienced powerlessness to control one's own work activities, is examined among the nursing force of a large mental hospital. It is found that alienation is intensified where authority relations are such as to limit the reciprocal influence of subordinates. This is reflected in situations where there is great positional disparity between subordinates and their subjects, where authority is exercised in a peremptory fashion and where authority figures are physically inaccessible. Career experiences within the hospital opportunity structure are also related to alienation; limited achievement and dissatisfaction with extrinsic work rewards are alienative conditions. Finally, personnel working in isolation and without outside social ties to fellow workers are more subject to intense alienation."—*L. Berkowitz.*

2112. Phelan, Joseph G. (Los Angeles State Coll.) **Exploration of personality correlates to business risk-taking behavior.** *J. Psychol.*, 1962, 53, 281-287.—An attempt to ascertain if business students, classified by scores on Cautiousness subscale of Gordon Personality Inventory, might make differentiated risk-taking decisions in a simulated business situation. 12 groups, composed of 3 cautious, neutral, or impulsive personality types per group, were paired against each other in all combinations to play the business game, "Management," produced by Avalon-Hill Company. Criterion measures were made in terms of amount of money and number of units offered as a bid for sale. Response latencies for the time required to make the decisions were also ascertained. Sign tests were significant at less than the .05 and .01 levels for the dependent variables mentioned. Cautious groups tended to be more conservative in their bidding and impulsive groups more radical regardless of the feedback of the game which contained information relevant to monetary losses. The Wilcoxon rank test for paired observations was significant at less than the .02 level, substantiating magnitude differences in bidding.—*Author abstract.*

2113. Rim, Y. **Dimensions of job incentives and personality.** *Acta psychol., Amsterdam*, 1961, 18(5), 332-336.—Job security seems to play a more important role among Pittsburgh than among Haifa students. Low scorers on extraversion and neuroticism ranked opportunity to learn new skills as more important than did high scorers. Students scoring high on neuroticism ranked good salary as more important than did low scorers. Fear of failure is evident in high neuroticism and extraversion scorers.—*G. Rubin-Rabson.*

2114. Willing, J. Z. **The round-table interview: A method of selecting trainees.** *Personnel*, 1962, 39(2), 26-32.—A selection technique used at Revlon, Inc. is described. Their method of choosing management trainees not only saves executive time but also seems to result in better decisions. Through discussion, a great deal is learned about the candidates before a hiring commitment is made.—*V. Staudt-Sexton.*

MANAGEMENT & ORGANIZATION

2115. Bostrom, Karl. (Milwaukee, Wis.) **Venture management and national growth.** *Advanc. Mgmt.*

Off. Exec., 1962, 1(2), 20-23.—"If . . . we are going to move forward and continue to lead the world as a free enterprise system the time is now to take cognizance of the fact that national growth is made by innovators who use the tools and techniques of money and planning after they have ideas . . . not the other way around. We have steadily bled out of the population, both in our schools and in our jobs, the ideals of enterprising, the exhilaration and high motivation of being on one's own. . . . the large and small Foundations, whose capital was created by great entrepreneurs." We know appallingly little about the conception of "independent venture management." It is up to all our public and private institutions to help initiate a new entrepreneurial explosion that will put us back on the high road of national growth.—*E. Q. Miller.*

2116. **Chruden, Herbert J., & Sherman, Arthur W., Jr. (Eds.)** (Sacramento State Coll.) *Readings in personnel management*. Cincinnati, O.: South-Western, 1961. viii, 693 p. \$7.00—A collection of 64 articles published in professional (management) and trade journals between 1955 and 1960, selected as supplementary readings for personnel management courses. Articles are grouped in 12 chapters titled "The Personnel Organization and Program," "Procurement and Development," "Morale and Adjustment," etc. The editors have added discussion questions at the end of each article and an introduction and bibliography for each chapter.—*M. L. Kelly.*

2117. **Dill, W. R., Hilton, T. L., & Reitman, W. R.** (Carnegie Inst. Technology) *The new managers: Patterns of behavior and development*. Englewood Cliffs, N. J.: Prentice-Hall, 1962. ix, 249 p. \$5.95.—Using an intensive interview technique 30 recent graduate school alumni were probed for the answer of what makes a successful manager in American industry today. The aspirant should decide what kind of manager he wants to be and why he wants to be one (reasons should be positive). Other qualities are that he be preferably in the top 10% of population intellectually, be well-trained, maintain an independent and somewhat skeptical attitude toward job demands, and accept ambiguity and uncertainty as a natural condition of work. He should also be perceptive about what his superior wants and expect variation in evaluation of his performance; should select an environment which permits him to test his interest, gives feedback on performance, and does not block opportunity; and should develop sensitivity skills as to his present situation and the likely future.—*E. Q. Miller.*

2118. **Emery, F. E., & Marek, Julius.** (Tavistock Inst. Human Relations, London) *Some socio-technical aspects of automation*. *Hum. Relat.*, 1962, 15(1), 17-25.—Some preliminary indications are offered on the effects of automation of a power plant. The changeover was completed smoothly and without any labor stoppages, disputes, or deterioration of labor-management relations. The technical improvements were achieved through: (a) increased complexity of the total process, (b) decreased tolerance for disturbances in the process, and (c) increased separation of operators from the process. This increased complexity places new demands on operators and changes the pattern of operator-supervisor relations. There is greater homogeneity and less of a responsibility gap. Problems in the use of the case

study method for evaluating the effects of automation are discussed.—*W. W. Meissner.*

2119. **Ferguson, Charles E., & Pfouts, Ralph W.** (Duke U.) *Learning and expectations in dynamic duopoly behavior*. *Behav. Sci.*, 1962, 7(2), 223-237.—The various theories of competition in the business world have shown marked discrepancies between model-analysis conclusions and real-world experiences. The present paper adds the principle of information feedback and the consequent generation of a learning process to these models and shows the efficacy of this additional assumption. (44 ref.)—*J. Arbit.*

2120. **Greenberger, Martin.** (Massachusetts Inst. Technology) *Management and the computer of the future*. New York: Wiley, 1962. xxvi, 340 p. \$6.00.—A series of 8 lectures and discussions. The topics covered are: scientists and decision making, managerial decision making, simulation of human thinking, a library for 2000 A.D., the computer in the university, time-sharing computer systems, a new concept in programming, and what computers should be doing. A selected bibliography and biographical sketches of all contributors and session chairmen are included.—*G. C. Carter.*

2121. **Greer, Edith S.** (United States Office Education, Washington, D. C.) *Human relation in supervision*. *Education*, 1961, 82, 203-206.—An investigation of human relations in supervision analyzed (a) tensions and pressures, (b) focus on human relations, (c) breakdown in communication, (d) identifying problems, and (e) action in improving human relations.—*S. M. Amatora.*

2122. **Guetzkow, H., Forehand, G. A., & James, B. J.** (Northwestern U.) *An evaluation of educational influence on administrative judgment*. *Admin. sci. Quart.*, 1962, 6(4), 483-500.—Studies of the effects on executive judgment of 2 executive development programs for government administrators are discussed. Superiors and peers of the participants, in a regional program of 33 weekly sessions, perceived a change in the behavior of the participants during the program, as compared with nonparticipating control members. The behavior of participants in 2- and 4-week residential programs was not perceived as changed. Changes in objective test performance were not observed for any of the participants. Differences in the results of the 2 programs were tentatively attributed to the different climates of the sponsoring organizations.—*V. Staudt-Sexton.*

2123. **Hund, James M.** (Emory U.) *Changing role in the interview situation*. *Publ. Opin. Quart.*, 1959, 23(1), 236-246.—A report of experiences in interviewing the executive personnel of business organizations. Topics covered were: the research site, sponsorship, preparing for the interview, the interview, criticism and comments, and conclusions.—*E. P. Hollander.*

2124. **Indian Institute Personnel Management.** *Personnel management in India: The practical approach to human relations in industry*. Bombay, India: Asia Publishing House; N. Y.: Taplinger Publications, 1961. 316 p. \$6.00.—The aim of the volume is to provide a text on the principles of personnel management against the present Indian scene rather than to rely on British or American sources. The social background of the worker who

migrates from country to town is first discussed, together with the adjustments he must make in the process. Part II discusses the nature of personnel management and how it developed in the West and in India. Part III is devoted to industrial relations (labor and social security legislation in India, employer and worker associations, and collective bargaining). Part IV describes the day-to-day work of a personnel department. Appendices give welfare officer service rules and case notes of actual Indian personnel operation schemes.—*W. L. Barnette, Jr.*

2125. Jerdee, Thomas Harlan. (U. Minnesota) **Supervisor perception of subordinate attitudes.** *Dissert. Abstr.*, 1961, 22(1), 334—Abstract.

2126. Katzell, Raymond A. (New York U.) **Contrasting systems of work organization.** *Amer. Psychologist*, 1962, 17, 102-108.—At present there is "no one conception or strategy of work organization that is unequivocally or universally superior to others, in terms of results achieved. . . . The malfunctioning of the classical, directive, or bureaucratic systems of organization has been . . . thoroughly aired. . . . The alternative strategy of organizational design of the democratic, participative, human relations type . . . proposed as a corrective . . ." is also questioned. Needed "is a scientific, descriptive theory of organization which spells out the relationships among given dependent variables . . . under various situational conditions or parameters."—*S. J. Lachman.*

2127. Kidd, J. A., & Christy, R. T. (Ohio State U.) **Supervisory procedures and work-team productivity.** *J. appl. Psychol.*, 1961, 45(6), 388-392.—"A complex task setting provided by the simulation of a radar air traffic control system was the context employed to evaluate the extent to which work-team productivity is modifiable as a consequence of different supervisors and supervisory procedures under different task loads. Six two-man teams were observed. Each team worked under each of three supervisors. The supervisors shifted from team to team. Three techniques were adopted alternately: laissez-faire, active monitoring, and direct participation. It was observed that the individual supervisor was a more consistent influence on performance than the particular role he employed. The effect of role per se was significant but interpretable only in light of the particular performance criterion used. For example, processing speed was greatest under laissez-faire conditions, while error avoidance was superior under the conditions which required more overt supervisory activity. Task load was not found to be an interactive factor."—*J. W. Russell.*

2128. Koch, Edward G. (U. California, Los Angeles) **Three approaches to organization.** *Harv. bus. Rev.*, 1961, 39(2), 32-43, 160-162.—The sociologists, psychologists, economists, and others who have published books on organizational theory may be divided into 3 groups: those who look upon organizational structures and controls as the means of improving management practices, those who use comparative studies of successful businesses to generate management principles, and those who make greater use of behavior science research findings to construct theories of organization. Publications of each type are summarized with the concept of authority as a focal point. Problems in the areas of human relations, decision making, and delegation of authority

appear to be the major difficulties facing today's managers.—*C. F. X. Youngberg.*

2129. Kornhauser, William, & Hagstrom, Warren O. **Scientists in industry: Conflict and accommodation.** Los Angeles, Calif.: Univer. California Press, 1962. xii, 230 p. \$6.00.—Increased utilization of scientists in bureaucratic organizations creates 2 problems: how to preserve professional autonomy, and how to contribute maximally to the general welfare. The detailed sociological analysis is based on interviews and social research. (14 p. ref.)—*R. Tyson.*

2130. Litwak, E., & Hylton, Lydia F. (U. Michigan) **Interorganizational analysis: A hypothesis on co-ordinating agencies.** *Admin. sci. Quart.*, 1962, 6(4), 395-420.—"Interorganizational analysis suggests the structural requisites for maintaining socially approved conflict while traditional organizational analysis suggests requisites for socially approved states of harmony. A theory of interorganizational co-ordination is presented based on (1) organizational interdependence (2) level of organization awareness (3) standardization of organizational activities, and (4) number of organizations. The power of this theory is illustrated by showing that nine presumably discrete problems of social welfare co-ordination are all variations of these same four factors."—*V. Staadt-Sexton.*

2131. Maier, N. R. F., & Hayes, J. J. (U. Michigan) **Creative management.** New York: Wiley, 1962. vii, 226 p. \$5.95.—Issues growing out of the interaction between man and organization are discussed candidly in this collaborative effort by a psychologist and a manager. Problem-solving conferences are proposed as a way of management whereby each person can serve as a participant in decisions made at the level of his superior and as a conference leader in decisions made at his own level. Answers are provided to issues such as how to involve subordinates in decisions, how to differentiate between decisions that concern facts rather than feelings, and how to resolve the conflict between management goals and personal goals.—*M. York.*

2132. Meltzer, L., & Salter, M. (Cornell U.) **Organizational structure and the performance and job satisfaction of physiologists.** *Amer. sociol. Rev.*, 1962, 27(3), 351-362.—"Mail questionnaires were completed by 75 per cent of all physiological scientists working in organizations in the United States. In an attempt to test some aspects of James Worthy's theory of organizational structure, three sets of variables were interrelated: (a) independent variables, i.e., size of organization, number of supervisory levels, and combinations of these; (b) intervening variables, i.e., freedom, job opportunities, funds, facilities, ability of the scientist, and type of institution—academic, governmental, or industrial; and (c) dependent variables, i.e., productivity and job satisfaction. In general, the theory was not supported."—*L. Berkowitz.*

2133. Meyer, H. H., Walker, W. B., & Litwin, G. H. (General Electric Co.) **Motive patterns and risk preferences associated with entrepreneurship.** *J. abnorm. soc. Psychol.*, 1961, 63, 570-574.—The relationship between n Ach and risk preference of managers was studied. The trends in the results demonstrated that there was a positive relationship

between the 2 variables, but that managers with high and low degree of policy power (entrepreneurship) could not be differentiated.—G. Frank.

2134. Patton, Arch. (McKinsey & Co., Inc.) What is an executive worth? *Harv. bus. Rev.*, 1961, 39(2), 65-73.—A compensation system aims at attracting men who are able to attain company objectives and motivating them to seek greater responsibility in the company. Both objectives are sometimes defeated when some functions are overvalued, the concept of "average" executive is misunderstood, or factors related to company size and industrial differences are not properly evaluated. The decisions which an executive makes or influences, which in turn lead to an increase or decrease in company profits, become a major variable in determining his worth.—C. F. X. Youngberg.

2135. Porter, Albert. (San Jose State Coll.) Effect of organization size on validity of Masculinity-Femininity score. *J. appl. Psychol.*, 1962, 46, 228-229.—A population of 195 pre-1944 male Stanford Graduate School of Business MBAs was analyzed for association between executive success criteria and scores on the Strong Vocational Interest Blank Masculinity-Femininity (SVIB MF) scale, controlling for size of employing organization (large $N=47$, medium $N=105$, and tiny $N=43$). No significant correlations were found between the SVIB MF scores and pay, job interest, or career progress satisfaction. Correlations were significant ($p < .05$) between MF scores and policy level and organization level, but were negative in large organizations and positive in medium and small organizations. The pattern of correlations suggests that masculinity of interests is positively associated with executive success in smaller organizations, inversely in larger organizations; more research is needed to test such a hypothesis and to explore the "meaning" of MF.—*Journal abstract*.

2136. Real, William H. (U. British Columbia) Upward communication in industrial hierarchies. *Hum. Relat.*, 1962, 15(1), 3-15.—A group of 52 superiors and 52 respective subordinates were randomly selected from 3 major industrial organizations and evaluated on 3 measures: accuracy of upward communication, mobility, and trust-influence. Hypotheses were tested concerning the relationship between upward mobility among executives and the accuracy of communication of problem-related information to superiors. In general, the relationship was found to be negative and significant. It is conditioned by the degree of interpersonal trust held by the executives for their superiors, and there is some indication that it is also conditioned by the degree of perceived influence of superiors by subordinates.—W. W. Meissner.

2137. Ritti, Raymond Richard. (Cornell U.) Engineers and managers: A study of engineering organization. *Dissert. Abstr.*, 1961, 21(12), 3845.—*Abstract*.

2138. Schaffer, R., & Woodyatt, P. New horizons for personnel management. *Personnel*, 1962, 39(2), 42-51.—Although there has been a growing awareness that human nature is not an obstacle to organizational efficiency, and a recognition that it is rather a rich source of strength, most companies persist in concentrating on ways of overcoming it. The

authors insist that there is need for a change now and they suggest the manner of making it.—V. Staudt-Sexton.

2139. Watters, A. F. (General Foods Corp.) Management and motivation: Releasing human potential. *Personnel*, 1962, 39(2), 8-16.—The fundamental facts of human nature were briefly summarized and were used to suggest ways in which management could stimulate the release of employees' creative powers. The suggested processes for establishing a more "motivating" work environment were (a) mutual involvement, (b) communication, (c) compensation.—V. Staudt-Sexton.

2140. Williams, Lawrence Kenneth. (U. Michigan) The measurement of risk-taking propensity in an industrial setting. *Dissert. Abstr.*, 1961, 21(12), 3847-3848.—*Abstract*.

ENGINEERING PSYCHOLOGY

2141. Baker, R. C., & Siegel, A. I. An operational evaluation of improved prototype seat cushion assemblies. Wayne, Pa.: Applied Psychological Services, 1957. iv, 32 p.—3 trilock-covered prototype seat cushion assemblies were evaluated through an in-flight test in order to determine the potential of seats for reducing seating discomforts on prolonged flights. 2 of the seat cushions incorporated an air cushioning principle plus seat pulsation; the 3rd also incorporated an air cushioning principle but was static. The data consist of ratings of the comfort of the seats and preference rankings. Comfort ratings and ranking data indicate that 2 of the seat cushion assemblies were statistically significantly superior to the present seat assembly. The superior seats incorporated pulsation and the static air cushion.—P. Federman.

2142. Blair, Wesley C., & Plath, Dean W. (General Dynamics Corp., Groton, Conn.) Submarine control with the combined instrument panel and a contact analog-roadway display. *J. engng. Psychol.*, 1962, 1, 68-81.—3 independent groups of 5 Ss were tested on one of 3 submarine control displays: a combined instrument panel (CIP), a contact analog-roadway (CAR) display with "order" interpretation, and a CAR display with "error" interpretation. Displays were mounted in a submarine simulator programmed for equations of motion of a "SKIPJACK Class (SS(N)585) submarine traveling at 20 knots." Measures of performance were time on course, on depth, and on both simultaneously. CAR displays were found to be inferior to the CIP display. "Order" interpretation was superior to "error" interpretation on the CAR displays.—D. C. Hodge.

2143. Frost, George G. (Aerospace Medical Lab.) An application of a dynamic pilot-model to system design. *USAF ASD tech. Note*, 1961, No. 61-57. 9 p.—Design, evaluation, and integration of controls and displays for advanced flight vehicles present recurrent problems for the human engineer. This report presents a method for solving these on a fast-time analog computer and describes one application. The basic concept of this approach centers about the use of a dynamic model of the pilot which can be instrumented on the computer along with the airframe and flight control dynamics, thus permitting design and evaluation of the total closed loop system during the early design phase.—USAF ASD.

2144. Matoušek, O. (Prague) *Úkola psychologie při konstrukci strojů a strojních zařízení.* [Psychological tasks involved in machine construction.] *Ceskoslov. Psychol.*, 1961, 5, 319-325.—The degree of interrelationship between man and the machine he works with differs qualitatively in various phases of technological development. The demands of the physical equipment of man gradually decrease, while demands on the agility of nervous processes, exactness and cooperation of analysers, attention, reactivity, etc. increase. A research program regarding the solution of the problem of adjusting man to the machine is proposed. Most important principles for machine construction with regard to psychological, physiological, and safety requirements are described. (33 ref., Russian & English summaries)—*V. Břicháček.*

2145. Ornstein, George Norman. (Ohio State U.) *Applications of a technique for the automatic analog determination of human response equation parameters.* *Dissert. Abstr.*, 1961, 21(11), 3533-3534.—*Abstract.*

Displays

2146. Cook, Kenneth G., Beazley, Richard M., & Robinson, John E. (Applied Psychology Corp.) *Aircraft conspicuity and flight attitude information provided by exterior paint patterns.* *J. appl. Psychol.*, 1962, 46, 175-182.—Experiments were conducted to determine the relative conspicuity of aircraft exterior paint patterns, and to investigate whether such paint patterns aided pilots in determining the attitude of the aircraft. The conspicuity studies, using paired comparisons of model airplanes, gave evidence that: (a) amount of red-orange fluorescent paint coverage is positively correlated with conspicuity; (b) high brightness paints should be placed on the upper surfaces of the aircraft and low brightness paints on the lower portions; (c) maximizing brightness contrasts between different parts of the aircraft surfaces does not enhance conspicuity; (d) flight attitudes, backgrounds, lighting conditions, and differences in Ss did not affect conspicuity significantly. The attitude studies in which pilots matched the model airplanes in some 1 of 15 attitudes, with 1 of 15 models mounted on a small display, indicated that the paint patterns used did not aid the pilots in making judgments of aircraft attitude. Differences in backgrounds and lighting conditions did not greatly affect Ss' ability to determine attitude.—*Journal abstract.*

2147. Federman, P. J., & Siegel, A. I. *Aircraft detectability and visibility: V. Detectability of stimuli coated with fluorescent and ordinary paints: A further study.* Wayne, Pa.: Applied Psychological Services, 1961. v, 41 p.—The detectability of various stimuli was investigated to provide information for increasing aircraft detectability by visual means. The results of the experiments, conducted in a field visual range situation, indicated that fluorescent yellow-orange was the most visible under the 3 meteorological (sky background) conditions. The mean threshold data over the 3 meteorological conditions suggested the following hierarchical order of detectability for the 6 stimuli: fluorescent yellow-orange, fluorescent red-orange, white, fluorescent red-orange with a white medial stripe, white with a black medial stripe, and ordinary orange.—*Author abstract.*

2148. Hodge, Milton H., & Pollack, Irwin. (U. Georgia) *Confusion matrix analysis of single and multidimensional auditory displays.* *J. exp. Psychol.*, 1962, 63(2), 129-142.—"Eight experiments were designed to evaluate a model—the constant-ratio rule—of sensory organization. The model was tested by comparing the obtained probabilities of 4×4 and 2×2 confusion matrices with the probabilities predicted from 8×8 matrices. The auditory dimensions of frequency, intensity, and duration were used singly and in combination to form single and multidimensional stimulus ensembles consisting of two, four, or eight tones. Six Ss attempted to identify, one at a time, the stimulus objects of the ensembles. The results indicate: (a) In general, the CRR makes excellent predictions of the response probabilities of the single and multidimensional matrices. The notable exceptions occur when predictions for 2×2 matrices are made from adjacent objects in widely spaced ensembles. (b) The CRR predicts the probabilities of the multidimensional matrices somewhat better than those of the single-dimension ensembles."—*J. Arbit.*

2149. Mackworth, Jane F. (Defence Research Medical Lab., Toronto, Canada) *The effect of display time upon the recall of digits.* *Canad. J. Psychol.*, 1962, 16(1), 48-54.—Messages of 9 or 10 digits in 2 rows were presented either with each digit in succession or all digits simultaneously. Message presentation times of 2.5, 5 and 10 seconds were used. Increasing both the time per digit and the number of digits shown simultaneously improved immediate recall. The block display at $\frac{1}{2}$ -sec/digit was significantly better than the single digit display at 1-sec/digit—a result which could be interpreted in support of decay theory. With display constant, however, the amount recalled increased with time per digit.—*R. S. Davidson.*

2150. Minor, Frank J., & Revesman, Stanley L. (IBM) *Experimental evaluation of binary codes for console display.* *J. appl. Psychol.*, 45(6), 381-387.—"Three binary code schemas were evaluated experimentally in terms of operator coding performance. One of the three code schemas was to be selected for use on a data processing system console display. The criterion for the code evaluation was the operator efficiency measured in terms of speed and accuracy of coding console problems. An independent group of subjects was assigned to each of the three code conditions. One of the three code schemas facilitated a significant time saving of 20-25% as compared to the remaining two code schemas. There were no differences in rate of error between the three code conditions."—*J. W. Russell.*

2151. Newman, Klaus M., & Davis, Anne R. (USN Electronics Lab., San Diego, Calif.) *Non-redundant color, brightness, and flashing rate encoding of geometric symbols on a visual display.* *J. engng. Psychol.*, 1962, 1, 47-67.—The effectiveness of "geometric symbol-only" encoding and "non-redundant symbol-plus-other-dimension(s)" encoding were compared in terms of accuracy and speed for both searching and decoding tasks. Encoding parameters were 36 geometric forms, 2 brightness levels, 3 flashing rates, and 3 colors. Amount of displayed information was held constant. Results for 10 Ss indicated that color encoding leads to shorter response times and fewer errors than other methods.

With the exception of geometric shapes, combination of 2 or 3 levels of 3 encoding dimensions in one condition is detrimental to performance.—D. C. Hodge.

2152. Obermayer, R. W., Swartz, W. F., & Muckler, F. A. (Martin Co.) The interaction of information displays with control system dynamics in continuous tracking. *J. appl. Psychol.*, 1961, 45(6), 369-375.—9 Ss were each seated in a mockup of a fighter-type cockpit where they each moved a control stick to cause movement of a line on the TV-like picture tube. . . . "in no condition of this experiment was the following display found to be superior to the compensatory display. . . . Examination of significant subject interactions with treatments showed deviation in individual cases from the averaged group data."—J. W. Russell.

2153. Promisel, David M. (Johns Hopkins U.) Visual target location as a function of number and kind of competing signals. *J. appl. Psychol.*, 1961, 45(6), 420-427.—Using 20 college students, the influence of hue and shape on ability of operators to correctly describe location of objects, reflected on radar picture tubes, was studied. Variables included number of target signals, values of hue-shape combinations, number of signals, and the distribution of this competition between the hue and shape dimensions. The number of targets had by far the greatest effect on task time. Hue rather than shape is the critical factor. (15 ref.)—J. W. Russell.

2154. Promisel, David Mark. (Johns Hopkins U.) Visual target location as a function of number and kind of competing signals. *Dissert. Abstr.*, 1961, 22(1), 336-337.—Abstract.

2155. Reilly, Raymond E., & Teichner, Warren H. (U. Massachusetts) Effects of shape and degree of structure of the visual field on target detection and location. *J. Opt. Soc. Amer.*, 1961, 52(2), 214-218.—The effects of the degree of structuring and the form of the visual field on target detection and target location were investigated for 3 different search times. 30 undergraduate Ss searched for low-visibility targets on a special screen and recorded the target locations on prepared data sheets. The results suggest that both target detection and location are related in a nonmonotonic fashion to the degree of structure and to the form of the field. The structuring continuum was defined as the division of the search area into 2 or more partitions of equal area. Optima for both measures occurred at the low end of the continuum. Of the 2 forms investigated, performance with square fields was generally superior to that for circular fields. In answer to a questionnaire after the experiment, a majority of Ss reported a preference for searching the square fields. Both target detection and target location varied directly with amount of search time. However, the functions tended to increase rapidly at first and then level off at the longer search times.—Journal abstract.

2156. Robinson, John E., Jr., Cook, Kenneth G., & Zeleny, Charles E. (Applied Psychology Corp.) Pilot judgments of simulated collisions and near misses: A comparison of performance with uncoded and two-tone coded models. *J. appl. Psychol.*, 1961, 45(6), 359-363.—If aircraft are painted according to a visual code to designate front from rear and top from bottom, will this help pilots avoid collisions with other aircraft? "Six experienced

pilots completed a total of 144 training and practice problems and 288 test problems." Assimulated situations involved closed circuit TV were used. The visual coding did not help.—J. W. Russell.

2157. Stirner, F. W., Siegel, A. I., & Baker, R. C. Caution and warning light indicators for naval aircraft: V. An experimental comparison of visual, auditory, and visual-auditory "master" signals. Wayne, Pa.: Applied Psychological Services, 1957. ii, 25 p.—Ignoring tactual stimuli, the following variations of the master indicator concept are possible: a master light signal, a master auditory signal, and a simultaneously presented master light and master auditory signal. The 3 variations were experimentally compared, and the data suggest that the auditory master indicator presentation has better attention-arresting potential than either of the other 2 variations. The implications of this finding for aircraft purposes are discussed.—P. Federman.

2158. Weidenfeller, E. W., Baker, R. A., & Ware, J. R. Effects of knowledge of results (true and false) on vigilance performance. *Percept. mot. Skills*, 1962, 14, 211-215.—4 groups monitored a simple display for a 3-hr. period. 79 Ss were divided into a control group, an irrelevant stimulus (IS) group, a knowledge of results (KR) group, and a "false" knowledge (FKR) group. The signal, presented on a 24-per-hour variable schedule, was a brief interruption of a continuous light. For the KR, FKR, and IS groups a 2nd white light was used to provide knowledge of results, and additional irrelevant stimulation. A comparison of the detection performance showed a significantly higher probability for both knowledge of results groups. No significant difference was obtained between the IS and the control groups or between the KR and FKR groups.—W. H. Guertin.

Controls

2159. Braman, Heather R. (Ed.) Human factors of remote handling in advanced systems. *USAF ASD tech. Rep.*, 1961, No. 61-430. 192 p.—This report compiles the papers presented at the Human Factors of Remote Handling in Advanced Systems Symposium, sponsored by the Aerospace Medical Laboratory in April 1961. Human factors in remote handling as viewed by the psychologist and the engineer are discussed. Problems of operator selection and training are presented and manned and unmanned ground support equipment for nuclear-powered aircraft are reviewed. Space environmental constraints on extra-vehicular space operations are assessed. A representative remote-handling system for space operations is described and a 3-dimensional color television system for remote handling is analyzed and evaluated. Human factors in design of remote-handling equipment are discussed.—USAF ASD.

2160. Siegel, A. I., & Schultz, D. G. An investigation into factors affecting control activation: I. Survey and definition of variables. Wayne, Pa.: Applied Psychological Services, 1962. iii, 20 p.—Factors affecting the speed and accuracy of activating selected aircraft controls were investigated. 6 variables were selected for study: control number, control density, activation sequence, control complexity, link multiplicity, and time criticality. The experimental program, based on this survey, will test the relationship of each factor to control activation

speed and accuracy. Anticipated relationships are presented. The Universal Control Activation Simulator, designed and constructed to meet the requirements of this research, is described.—*P. Federman.*

SIGNS & LEGIBILITY

2161. Hughes, Charles L. (IBM) **Variability of stroke within digits.** *J. appl. Psychol.*, 1961, 45(6), 364-368.—As the demands of the machine on the man increase, how can the man be helped to identify quickly, on sight, numbers from 1 to 10? College students tried to identify 8 variations on each of the 10. "... each digit must be designed on an individual configuration basis taking form, stroke widths, and their combinations into account. Two factors must be considered: a. absolute recognition of the digit as such, b. differentiation (by relative emphasis) of features that suggest similarity (hence ambiguity)." (20 ref.)—*J. W. Russell.*

2162. Štikar, J. (Výzkumný ústav bezpečnosti práce, Prague) **Čitelnost číslic.** [Legibility of numerals.] *Ceskoslov. Psychol.*, 1961, 5, 358-362.—No differences in the reading speed found between Mackworth, Gill, and the Czechoslovak National Standard type of numerals. The Gill half thick type numerals are the most accurate for legibility. (Russian & English summaries)—*V. Břicháček.*

DRIVING, ACCIDENTS, SAFETY

2163. Bureš, Z. (Charles U., Prague) **Úkoly psychologie v bezpečnosti práce.** [The tasks of psychology concerning safety of work.] *Ceskoslov. Psychol.*, 1961, 5, 326-336.—The chief features in the area of the safety of work in Czechoslovakia are: (a) the need to combine practical experience with empirical knowledge in a unified comprehensive system, (b) the requirement that accident and injury prevention be planned with perspective and as a part of the entire complex of design and construction of plants and means of production, (c) the need for a rapid transition from the previously narrow and negatively formulated safety precautions to a positive and broader concept of workers' safety insuring optimal working conditions generally. The following problems of work safety are discussed: ascertaining the causes of accidents, psychological research of personal causes of accidents, safety instruction and training, use of personal safety equipment, and suitable arrangement of the working conditions. (36 ref., Russian & English summaries)—*V. Břicháček.*

2164. Dobbins, D. A., Skordahl, D. M., & Anderson, A. A. **Prediction of vigilance: AASHO Road Test.** *USA PRO OCRD tech. Res. Note*, 1961, No. 119. 30 p.—This report describes the 2nd of 2 studies of vigilance in connection with a road test sponsored by the American Association of State Highway Officials and administered by the Highway Research Board of the National Academy of Sciences. Army drivers operated trucks on experimental highways (November 1958 to November 1960) under conditions conducive to boredom and fatigue—characteristic of many Army monitoring jobs. The primary objective of this study was to determine which, if any, of several well-known psychological domains holds the most promise for prediction of vigilance performance. A total of 39 predictors and 2 reference measures, grouped into 8 predictor clusters and a

single reference cluster, were administered. In general, both reliability and validity coefficients were low. The most promising predictors were the Personality, Personal History, Driver Aptitude, and Perceptual Speed clusters. The Cognitive, Physical, Psychomotor, and Attitudinal clusters were least promising. Measures paralleling more closely the parameters of the criterion task—signal rates, intersignal intervals, sensory modes—might be expected to show greater promise.—*A. J. Drucker.*

2165. Dobbins, D. A., Tiedmann, J. G., & Skordahl, D. M. **Field study of vigilance under highway driving conditions.** *USA PRO OCRD tech. res. Note*, 1961, No. 118. 46 p.—Opportunity for an initial study of vigilance was afforded by a road test sponsored by the American Association of State Highway Officials and administered by the Highway Research Board of the National Academy of Sciences. Army drivers operated trucks from 1958 to 1960 on experimental highways under conditions of monotony and restricted environment characteristic of many Army monitoring jobs. This study, conducting during the 2nd year of the road test, was designed (a) to examine the general level of signal detection of the 42 drivers and determine the nature and extent of any decrement in vigilance over a 7-hour driving shift, and (b) to examine the range and stability of individual differences in signal detection scores. In spite of such inhibitory factors as noise, vibration, long hours, boredom, and fatigue, overall level of signal detection was high and remained high throughout the driving periods (83% of all critical signals were detected). Increased variability in individual vigilance performance was observed in the later driving periods. The specially constructed Vigilance Tester provided psychometric scores consistent enough to justify further research use.—*A. J. Drucker.*

2166. Grunert, Johannes. (Denningerstr. 5, Munich, Germany) **Unfallkeim—Unfalldisposition—Unfall.** [Accident germ—accident disposition—accident.] *Z. exp. angew. Psychol.*, 1961, 8(4), 519-539.—A psychodynamic theory of accidents combines functional, structural, and depth-psychological factors. Acute conflicts may form the germ of an accident. If the ego no longer is able to govern the conflict tension, this germ can develop into accident proneness by reducing perceptual consciousness and environmental contact. Simultaneous aggressive tendencies can lead to spontaneous motoric impulses causing slips leading to accidents.—*W. J. Koppitz.*

2167. Hulthen, Lamek. (Royal Inst. Technology, Stockholm, Sweden) **A note on detection probability and observance in road traffic.** *Bull. Inform. C.I.D.I.T.V.A.*, 1962, No. 9. 8 p.—A theoretical approach to the behavior of an automobile driver in traffic. The probabilities of detecting traffic signs and signals under various conditions are worked out under the theory. The eye is a less efficient detection system than the ear.—*E. L. Borrowman.*

2168. Kronenburger, E. J. (Technology, Inc., Dayton, O.) **Interpersonal aspects of industrial accident and nonaccident employees.** *Engng. industr. Psychol.*, 1960, 2, 57-62.—Leary's Interpersonal Check List was administered to 18 Ss who had had accidents and 35 Ss who had not. There was some tendency for the accident group to express more hostility toward themselves than did the nonaccident

group, but no significant differences at the .05 level or better were found.—C. F. X. Youngberg.

2169. Marcus, Irwin M., Wilson, Wilma; Kraft, Irvin; Swander, Delmar; Southerland, Fred, & Schulhofer, Edith. (Tulane U.) An interdisciplinary approach to accident patterns in children. *Monogr. Soc. Res. Child Developm.*, 1960, 25(2, Whole No. 76). 79 p.—Using the services of psychiatrists, social workers, and psychologists, this investigation compared children from 6 to 10 years of age who had 3 or more accidents with an enuretic group and a symptom free group. 4 aspects were studied—psychological, physical, intrafamily, and behavioral response. The accident child was distinguishable on the first 3, giving evidence of emotional problems in the same frequency as the enuretic; showing more activity before and after birth and being more motor than cognitive in response; and having anxious, insecure and nonassertive parents. (67 ref., appendices.)—J. S. Braun.

2170. Schuster, Donald Herbert. (U. Southern California) The development of attitude scales to predict accident repeater and moving violator drivers. *Dissert. Abstr.*, 1961, 21(12), 3846-3847.—Abstract.

ADVERTISING & CONSUMER PSYCHOLOGY

2171. Britt, Steuart Henderson. *The spenders*. New York: McGraw-Hill, 1960. xiii, 293 p. \$4.95.—A book about the consumer, his actions, reactions, and how he spends his money. It is also about the products he buys, how they are marketed and advertised, and how this affects buying.—E. Y. Beeman.

2172. Emery, F. E. Heuristic models of the marketing process. *Hum. Relat.*, 1962, 15(1), 63-76.—2 models of the marketing process are presented: the 1st concerned with the psychological processes by which a person becomes a customer, the 2nd concerned with the manner in which these processes are initiated and more or less consciously controlled. (19 ref.)—W. W. Meissner.

2173. Finnegan, Eugene J., & Sheuring, John J. (U. Georgia) Consumer preference for sugar levels in ice cream and frozen desserts: II. Emulsifier-stabilizer levels in chocolate ice cream. *Food Technol.*, 1962, 16, 113-116.—Using a constant sugar level (18%) previously established by a similar survey, 4 ice creams were manufactured containing .14%, .24%, .34%, and .44% emulsifier. They were preference tested by 1073 persons in 357 households, using the method of paired comparisons. Data were analyzed by a method which takes into account the indirect as well as the direct comparisons. The .24% product was significantly preferred to all others. No sex differences were found, but people over 60 preferred .34% emulsifier. Stated reasons for preference were "creamier," "smoother," and "chocolate flavor better." Homemakers stated they would not pay 5¢/pt. more for their preferred ice cream.—D. R. Peryam.

2174. Greyser, Stephen A. (Harvard Business School) The case of the befuddled brewers. *Harv. bus. Rev.*, 1961, 39(2), 136-154.—A real-life situation involving the application of theory to advertising strategy is presented. Several approaches to a solution are outlined.—C. F. X. Youngberg.

2175. Harary, F., & Lipstein, B. The dynamics of brand loyalty: A Markovian approach. *Operat. Res.*, 1962, 10(1), 19-40.—"Our purpose is to attempt to apply . . . Markov chains to a . . . study of . . . brand switching and brand loyalty. After summarizing the traditional basic concepts of Markov chains, we introduce concepts for the theory of directed graphs in order to provide a geometric and intuitive point of view. We then demonstrate that the set of all brands of a particular product category can be regarded as a concrete case of an abstract Markov chain. The implications of this approach for marketing strategy are discussed."—M. R. Marks.

2176. Katona, George. (U. Michigan) *The powerful consumer: Psychological studies of the American economy*. New York: McGraw-Hill, 1960. ix, 276 p. \$6.50.—"This book is a product of work done at the Survey Research Center of the University of Michigan." The data was obtained from nation-wide surveys over the period from 1945 to 1959. The book is organized into 4 parts: (a) an introduction; (b) a section on consumer attitudes, changes in attitudes, and their effects; (c) the influence of motives, levels of aspiration, group influences, and rational behavior; and (d) the effects of economic fluctuations, prosperity, inflation, and recession.—E. Y. Beeman.

2177. Krugman, Herbert E. (Ted Bates & Co., Inc., NYC) The learning of consumer preference. *J. Market.*, 1962, 26(2), 31-33.—Hypotheses were tested pertaining to consumer preferences based on repeated product exposures. Photos of 2 sets of packages of washday products were presented tachistoscopically with 5 time-varying exposures to sample groups (N = 60, 30, 27) in 3 geographic areas. Results indicate that repeated exposures to a package can significantly alter the rank order of consumer preference.—P. L. Crawford.

2178. McMurray, Robert N. (McMurray Co., Chicago) The mystique of super-salesmanship. *Harv. bus. Rev.*, 1961, 39(2), 113-122.—"The possessor of an effective sales personality is a habitual 'wooer,' an individual who has a compulsive need to win and hold the affection of others . . . it develops so early in life that for all practical purposes it might as well be inborn." 5 other qualities are needed to supplement the wooing instinct: high energy level, abounding self-confidence, chronic hunger for money, habit of industriousness, and ability to perceive each objection or obstacle to a sale as a challenge.—C. F. X. Youngberg.

2179. Michelsen, Ross; Martin, W. H., & Colson, T. J. (Kansas State U., Manhattan) A consumer preference study on type of vanilla flavoring in ice cream. *Food Technol.*, 1962, 16, 102-104.—A consumer preference study was run on ice creams flavored with pure, artificial, and fortified (mixture of the 2) vanilla extract. 431 persons, recruited through social groups or by an area sample of Manhattan households, tasted the 3 samples and ranked them according to general acceptability. Data were classified according to age, sex, and socioeconomic status and significance was tested by means of a Friedman 2-way analysis of variance. Significant differences were found only with some subgroups. Most preferred the fortified extract; however, people over 70 preferred the pure extract and high socioeconomic

status women preferred imitation. Differences are attributed to the quality of the flavoring material and the intensity of the flavor in the ice cream.—D. R. Peryam.

2180. Thumin, Frederick J. (Washington U.) **What psychologists should know about marketing and advertising research.** *J. Psychol.*, 1962, 53(2), 329-347.—A documental discourse on marketing and advertising research as a profession for psychologists. Consideration is given to (a) the growth of the field and current opportunities, (b) the functions which psychologists perform, (c) desirable and undesirable features of the profession, (d) academic preparation, and (e) the type of individual best suited for this line of work. The author also discusses the moral criticisms which have been raised against psychologists entering the marketing and advertising field.—*Author abstract.*

2181. Tilgner, Damazy J. (Politechnical U., Gdanska, Poland) **Anchored sensory evaluation tests.** *Food Technol.*, 1962, 16, 47-50.—“Quality scoring of food products by sensory means is generally done by reference to mental standards. . . . Accuracy in quality scoring could be much greater if objective standards were available . . . for ready reference in restandardization. . . . it should be the

aim of sensory grading systems to provide objective, easily reproduced, and unvarying reference standards for this purpose.” Procedures are described for establishing and verifying such standards for quality attributes of hot-smoked fish, such as color intensity, gloss, juiciness, and saltiness. An anchored dilution index test is described where reference standards are prepared by adding known quantities of adulterant to a standard food. Results are presented.—D. R. Peryam.

2182. Westfall, Ralph (Northwestern U.) **Psychological factors in predicting product choice.** *J. Market.*, 1962, 26(2), 34-40.—The study was an attempt to identify consumer personalities attracted to convertible, compact, and standard automobiles. 231 car owners in Los Angeles and Chicago were included in the sample studied. Analysis of responses on the Thurstone Temperament Schedule indicate that such characteristics as active, impulsive, stable, and sociable have greatest value as predictors of the type car owned. Individuals scoring high in these areas are most likely buyers of convertible cars—with “activity” being the best predictor of the group. This conclusion must be accepted with caution because of the limitation of sample size and the methodology used.—P. L. Crawford.

BRIEF SUBJECT INDEX

This index supplements, but does not duplicate, the classification of abstracts given in the Table of Contents. It is assumed that the reader will have scanned whatever categories of classification interest him and that he will use this index only for cross references or for subjects that are more specific than the general categories of the classification. When many numbers are encountered under a heading, the reader may simplify his task by matching the numbers found under the two or more headings that specify his particular interest.

- Prejudice (See also Attitude), 1057, 1061, 1069, 1079, 1085
- Prestige (See also Socioeconomic class; Status), 1034, 1325, 1745, 2057
- Prison inmate, 369, 1745

BRIEF SUBJECT INDEX

- Probability (See also Learning/probability), 177, 182, 426, 479, 480, 506, 508, 983
 Probability learning (See Learning/probability)
 Problem solving (See also Choice behavior; Decision making), 24, 68, 422, 467, 620, 801, 869, 1092, 1114, 1120, 1132, 1153, 1620, 1999
 Productivity, 1142, 1852, 2093, 2098, 2103, 2127
 Profession, 104, 113, 128, 2180
 Proficiency, 1258, 2000
 Profile, 72, 107, 1260
 Programmed instruction (See also Teaching Machine), 1872, 1881, 1884, 1885, 1889, 1891, 1895, 1897, 1898, 1899, 1901, 1908, 1909, 1912
 Programming, 52, 60, 63, 64, 68, 72, 73, 74, 75, 78, 79, 80, 483, 484, 1890, 1897, 1908
 Progressive Matrices Test, 367, 1204, 1698, 1788, 2046
 Projective technique (See also Blacky Pictures; Rorschach; Thematic Apperception Test), 831, 891, 1059, 1094
 Proprioception (See Kinesthesia; Vestibular sense)
 Protestantism, 1012, 1054, 1309, 1324
 Psychiatric diagnosis (See also Personality assessment; Psychiatry), 1296, 1390, 1547, 1570
 Psychiatric patient, 420, 608, 1094, 1208, 1287, 1379, 1386, 1396, 1490, 1491, 1493, 1497, 1500, 1501, 1504, 1505, 1506, 1510, 1511, 1513, 1542, 1546, 1549, 1551, 1553, 1554, 1557, 1558, 1559, 1561, 1567, 1570, 1766, 1767, 1768, 1778, 1782, 1784, 1793, 1805, 1807
 Psychiatrist, 1177, 1416, 1493, 1515
 Psychiatry (See also next heading; Psychiatric diagnosis; Psychotherapy; Social psychiatry), 8, 11, 1332, 1376, 1377, 1378, 1481, 1483, 1484, 1487, 1507, 1578, 1701
 Psychoanalysis (See also next headings), 12, 1350, 1351, 1352, 1354, 1357, 1361, 1366, 1370, 1399, 1407, 1433, 1777
 Psychoanalysis/theory, 1411
 Psychoanalysis/therapy, 1359, 1399, 1400, 1420, 1422, 1797, 1810, 1830
 Psychodrama (See also Psychotherapy/group), 118
 Psychological tests (See Tests & testing)
 Psychologist (See also Profession), 7, 123, 125, 126, 128, 129, 130, 1438, 1515, 1815, 2029
 Psychology (See also next heading; Educational psychology; Social psychology; Industrial psychology), 2, 16, 27, 28, 34, 36, 37, 54, 91, 93, 95, 121, 127, 136, 321, 524, 527, 815, 985, 1873, 1883, 2025
 Psychology abroad, 10, 13, 14, 15, 19, 110, 812, 814, 840, 842, 846, 854, 2026
 Psychomotor performance (See also Performance), 10, 1794
 Psychoneurosis (See also Neurosis), 1827
 Psychopathology (See also Abnormal psychology), 918, 1576, 1816, 1833
 Psychopathy (See also Mental disorder), 1281, 1761, 1762, 1770, 1816, 1836
 Psychopharmacology (See also Drug effects), 652
 Psychophysics (See also next headings), 62, 90, 170, 178, 429, 530, 588, 982, 1577, 2181
 Psychophysics/method, 229, 2173
 Psychosis & psychotics (See also next heading; several kinds of psychosis; Mental disorder), 216, 323, 1260, 1287, 1295, 1403, 1581, 1583, 1850
 Psychosis/children, 1772
 Psychosomatic disorder, 1377
 Psychotherapy (See also next headings; Psychoanalysis), 18, 33, 371, 1299, 1314, 1385, 1450, 1460, 1502, 1747, 1771, 1813
 Psychotherapy/children, 1402, 1404, 1441, 1482
 Psychotherapy/group, 118, 972, 1114, 1423, 1440, 1518, 1523, 1525
 Psychotherapy/nondirective, 7, 1432, 1444
 Psychotherapy/research in, 1405, 1434, 1444
 Public Opinion (See also Opinion), 126, 1037, 1045, 1049, 1053, 1088, 1089
 Pulse (See Blood; Cardiovascular; Heart)
 Punishment (See also Discipline; Reinforcement/negative), 749, 753, 795, 1076, 1086, 1782
 Q-sort, 1187, 1980
 Questionnaire (See also Check list; Inventory; Scale; Survey), 1241, 1245, 1252, 1255, 1455
 Rabbit, 561, 567, 571, 577, 585, 592, 663
 Race, 1035, 1093
 Radiation, 2153
 Rat (See also next headings), 191, 550, 555, 557, 566, 591, 622, 625, 628, 634, 674, 677, 686, 694, 696, 697, 698, 699, 701, 702, 703, 704, 705, 707, 713, 714, 726, 736, 737, 751, 754, 758, 768, 773, 781, 783, 789, 796, 809
 Rat/activity, 721
 Rat/avoidance in, 542, 635, 673, 698, 707, 738, 756, 757
 Rat/deprivation in, 715, 716
 Rat/discrimination in, 643, 743, 746, 790
 Rat/drug effects in, 635, 636, 638, 643, 644, 657, 659
 Rat/learning in, 434, 638, 646, 683, 735, 779, 791, 793
 Rat/motivation in, 794
 Rat/reinforcement in, 715, 760, 761, 762, 763, 764, 766, 767, 770, 771, 772, 774, 778, 780, 785, 786, 787, 788, 795, 805
 Rat/secondary reinforcement, 742
 Rating, 1186, 1223, 2054, 2055
 Reaction time, 331, 332, 334, 492, 505, 578, 2086, 2108
 Reactive inhibition (See Inhibition/reactive)
 Reading (See also next headings), 350, 1155, 1156, 1157, 1164, 1638, 1666, 1669, 1881
 Reading deficiency, 1658, 1949, 1952, 1953, 1954, 1955, 1958, 1960
 Reading interest, 1944
 Reality, 152, 185, 894, 1148, 1577
 Reasoning (See also Cognition; Thinking), 480, 1212, 1437
 Recall (See also Memory; Recognition; Retention), 408, 439, 440, 442, 444, 450, 454, 2149
 Recognition (See also Memory; Recall; Retention), 173, 221, 354, 387, 442, 469, 1158
 Recreation, 1944
 Reference group (See also Group), 1091, 2101
 Reflex, 741, 820, 825, 1663, 2088
 Refugee, 1297
 Regression, 75, 1213, 1781
 Rehabilitation (See also next heading; Counseling; specific disabilities), 1509, 1511, 1513, 1594, 1599, 1606, 1650
 Rehabilitation/vocational, 1523, 1525, 1542, 1545, 1557, 1559, 2036
 Reinforcement (See also next headings; Discipline; Knowledge of results), 511, 715, 757, 788, 791, 838, 1806, 1947
 Reinforcement/delayed, 786
 Reinforcement/intermittent, 747, 760
 Reinforcement/negative (See also Punishment), 669, 744, 748, 1795
 Reinforcement/partial, 413, 425, 432, 762, 764, 769, 771, 774
 Reinforcement schedule, 421, 441, 641, 665, 755, 760, 761, 765, 766, 770, 772, 775, 779, 784, 787, 864, 1699
 Reinforcement/secondary, 410, 418, 742, 747
 Reinforcement/verbal, 411, 420, 1709, 1795, 1798, 1809
 Reliability, 69, 81, 1199, 1257, 1600, 1743, 2083, 2105
 Religion (See also Cultures), 33, 36, 1040, 1054, 1062, 1186, 1309, 1324, 1332, 1355, 1446, 1942
 Reminiscence, 355
 Report, 138, 145, 259, 373, 409, 444, 462, 474, 501, 514, 758, 771, 796, 1088, 1436, 1641, 2055, 2075, 2076, 2087, 2123, 2143, 2159
 Repression (See also Defense mechanism), 1288, 1301, 1339, 1341, 1449
 Research (See also Experimentation; Research methods; Survey research), 21, 116, 117, 996, 1128, 1478, 1516, 1859
 Research methods, 1, 51, 843, 959, 1376, 1388, 1830
 Reserpine, 639, 669
 Respiration, 655, 2082
 Response (See also next heading; Delayed reaction; Set/response), 177, 330, 349, 357, 361, 406, 469, 515, 754, 758, 767, 776, 780, 781, 789, 1252, 1261, 1872, 1895, 1899
 Response latency, 345
 Resting, 2087
 Restraint, 315
 Retardate (See Mental retardation)
 Retention (See also Forgetting; Learning; Memory; Recall; Recognition; Reminiscence), 391, 551, 553, 860, 1154, 1394, 1680, 1682, 1899
 Reticular formation, 579, 580, 593, 594, 596, 679, 1584
 Retina (See also Electoretinography; Eye), 228, 598, 605, 606, 612
 Reward (See also Reinforcement), 412, 509, 525, 790, 1782
 Rigidity (See also Stereotype), 369, 469, 1220, 1303, 1328, 1621, 1699, 1918
 Role, 114, 884, 909, 949, 1095, 1127, 1322, 1344, 1537, 1549, 1564, 1774, 1980, 2021
 Role playing, 887, 1306, 2027
 Rorschach Test (See also next headings; Projective technique), 111, 1006, 1011, 1213, 1278, 1297, 1800
 Rorschach Test/diagnosis, 1734
 Rorschach Test/responses, 1267, 1273, 1275, 1277, 1579, 1652
 Rosenzweig Picture Frustration Study, 890
 Running (See also Activity; Motor performance; Sports), 767, 773, 789
 Rural-urban (See also Community; Farming; Urban), 930, 941, 992, 1548
 Russia (See USSR)
 Safety (See also Accident), 316, 2163
 Salesman, 2178
 Salt (See Sodium chloride)
 Sample size, 58
 Sampling, 433
 Satiation, 336, 1138, 1139
 Scale (See also California F Scale; Children's Manifest Anxiety Scale; Inventory; Taylor Manifest Anxiety Scale; Stanford-Binet Intelligence Scale; Test; Wechsler Adult Intelligence Scale; Wechsler-Bellevue Intelligence Scale; Wechsler Intelligence Scale for Children), 366, 850, 923, 1050, 1058, 1059, 1079, 1119, 1190, 1201, 1213, 1224, 1231, 1262, 1272, 1295, 1310, 1317, 1455, 1544, 1693, 1708, 1803, 2104, 2170
 Scaling (See also Measurement), 44, 79, 404, 1064, 1179, 1116
 Schedule (See also Edwards Personal Preference Schedule), 312, 1011, 2182
 Schizophrenia (See also next headings), 631, 640, 651, 653, 1283, 1390, 1394, 1403, 1419, 1571, 1582, 1583, 1763, 1764, 1766, 1820, 1821, 1822, 1849, 1850
 Schizophrenia/chronic, 1504, 1803, 1805, 1813, 1814
 Schizophrenia/paranoid, 1279, 1282, 1766, 1767
 Schizophrenia/treatment, 1400, 1412, 1797, 1810
 School (See also next headings; Achievement; College; Education; High School), 1087, 1716, 1717, 1871, 1878, 1957, 1990
 School achievement, 1919, 1928, 1962, 2005, 2015, 2047
 School adjustment, 1933, 1947
 School administration, 1127, 2021
 School learning, 1906
 School psychology, 1966
 Science, 31, 34, 35, 494, 1089
 Scientist, 107, 111, 117, 1089, 2129
 Score & Scoring, 1190, 1194, 1195, 1196, 1995
 Segregation (See Desegregation)
 Seizure (See also Audogenic seizure; Electroconvulsive shock), 645
 Selection (See also specific vocations; Counseling), 409, 691, 1965, 2114
 Self (See also next headings), 16, 892, 897, 1126, 1346
 Self concept, 948, 1036, 1198, 1304, 1313, 1322, 1722, 1778, 1919, 2008, 2032, 2052
 Self evaluation, 942, 1058, 1129, 1236, 1244, 1251, 1300, 1317, 1735, 1941
 Self image, 1028
 Self perception, 1492, 1767
 Semantic differential, 365, 489, 1050, 1070, 1173, 1230, 1267, 1279, 1322, 1345
 Semantics, 1138, 1153
 Senility (See Old Age)
 Sensation, 154, 178, 179, 592, 1664
 Sensitivity, 242
 Sensory deprivation (See Deprivation/sensory)
 Sentence Completion Test, 1198
 Serial learning (See Learning/serial)
 Serotonin, 645, 1821
 Set (See also next headings; Expectation), 247, 342, 344, 345, 859
 Set/response, 1223, 1231
 Sex (See also Mating behavior), 883, 939, 1230, 1529
 Sex differences, 471, 688, 876, 886, 909, 917, 1062, 1207, 1228, 1264, 1905, 2016
 Sex role (See also Masculinity/femininity), 880, 922, 960, 1683, 1689
 Sexual behavior (See also Courtship; Mating behavior), 561, 564, 695, 700, 720, 807, 1044, 1406, 1665, 1728
 Sexual deviation, 1727
 Shock & Shock intensity (See also Electroconvulsive shock), 159, 186, 388, 698, 702, 703, 707, 758, 809, 1396
 Shock/electroconvulsive (See Electroconvulsive shock)
 Sibling, 835, 885
 Signal, 239, 254, 293, 516, 2157, 2167
 Simulation, 483
 Size perception (See Perception/size)
 Skin (See also Pain; Warmth), 615, 630, 1468
 Sleep (See also Dreaming; Sleep deprivation), 92, 323, 569, 571, 573, 1468

BRIEF SUBJECT INDEX

- Sleep deprivation, 323, 324, 325, 578, 655, 1571
 Smell, 253, 1674
 Smoking, 253
 Social acceptance (See also Social desirability; Sociometric status), 366, 877, 945, 1056, 1058, 1325, 1860
 Social adjustment (See Adjustment)
 Social approval (See Social acceptance; Social desirability)
 Social behavior (animals), 690, 719
 Social behavior (man), 850, 987, 1442, 1745
 Social change, 1019, 1031
 Social class (See also Socioeconomic status), 113, 1014, 1028, 1029, 1030, 1031, 1032, 1487, 1514, 1582, 1818, 1851, 1927, 1929, 2100
 Social desirability (See also Social acceptance; Sociometric status), 961, 1020, 1223, 1226, 1249, 1250
 Social distance, 1027, 1043, 1116, 1496
 Social factor, 1012, 1586, 1978
 Social influence (See also Group), 424, 1024, 1101, 1103, 1104, 1105, 1121, 2176
 Social interaction, 986, 993, 996, 1000, 1316, 1705, 1784
 Social psychiatry, 1485, 1486, 1494, 1511, 1513, 1546, 1551, 1553, 1554, 1558, 1567
 Social psychology, 998, 1866
 Social science, 983
 Social structure (See also Social class; Socioeconomic status), 1009, 1025, 1528
 Social welfare, 1482
 Socialization, 896, 924, 1008, 1553, 1685
 Society (See also Culture), 1015, 1026, 1167, 1168, 1169, 1174, 1532
 Socioeconomic status (See also Social class; Social structure), 883, 1054, 2007
 Sociology, 54, 80, 1009, 1395
 Sociometric status (See also Social acceptance; Social desirability; Socioeconomic status), 888, 877, 1024, 1122, 1347
 Sodium chloride, 257, 726
 Sound (See also Audition; Loudness; Noise), 298, 731, 804
 Sound localization, 266, 283
 Space, 1715
 Space flight, 127, 148, 672, 2087, 2091, 2143
 Space perception (See Perception/space)
 Special education (See Education/special)
 Species (See Animals)
 Speech (See also next headings; Voice), 301, 1150, 1348, 1419, 1630, 1631, 1737, 1786
 Speech articulation, 1159, 1162, 1633, 1634, 1635, 1639, 1672
 Speech/defective (See also Speech therapy; Stuttering), 1827
 Speech therapy, 489, 1499, 1625, 1627, 1628, 1636, 1639, 1654, 1703
 Speed, 431, 650, 958, 1986
 Speed perception (See Perception/speed)
 Spiral aftereffect (See Aftereffect/spiral)
 Sports (See also Play; Recreation), 146
 Stammering (See Stuttering)
 Stanford-Binet Intelligence Scale, 503, 1210, 1704, 1706
 Statistics (See also next headings; Distribution; Factor analysis; Mathematics; Measurement; Variance), 57, 58, 59, 65, 66, 67, 69, 73, 87, 1189
 Statistics/estimation, 44, 55, 61, 62, 63, 77
 Statistics/nonparametric, 55
 Status (See also Social class; Social structure; Socioeconomic status), 1035, 1056, 1099, 1349
 Stereotype, 107, 351, 461, 1077
 Stimulation (See also Brain; Electrode), 92, 343, 584, 601, 717, 1240
 Stimulus generalization (See Generalization/stimulus)
 Stomach, 550, 1937
 Stress (See also next heading; Conflict), 338, 349, 358, 388, 659, 678, 701, 703, 704, 1012, 1175, 1297, 1403, 1641, 1849, 2056
 Stress (physiological), 32, 679, 1372
 Strong Vocational Interest Blank, 897, 2037, 2104, 2135
 Student (See also next headings), 1058, 1255, 1454, 1566, 1609, 1983, 2112
 Student/gifted (See also Gifted child; Gifted student), 1964
 Student/graduate, 136, 1084, 1127, 1514, 1933
 Student/high school, 450, 518, 939, 979, 1011, 1015, 1079, 1106, 1152, 1212, 1865, 1885, 1926, 1936, 1941, 1943, 1944, 1945, 1946, 1959, 1973, 1976, 1986, 1993, 1999, 2004
 Student/medical, 1488, 1921, 2002
 Study, 1935
 Stuttering (See also Speech/defective), 1435, 1622, 1637, 1640
 Subception (See also Defense/perceptual), 159, 457, 1170, 1225, 1336, 1337, 1768
 Success (See also Achievement), 415, 431, 889, 1309, 1919
 Sugar, 257, 718, 726, 763, 767, 794, 2173
 Suggestibility, 384
 Suggestion (See also Hypnosis), 327, 1730, 1731, 1732, 1734, 1846
 Supervision (See also Authority; Executive; Leadership), 2121, 2125, 2127
 Surgery, 1382
 Survey (See also Battery; Check-list; Guilford-Zimmerman Temperament Survey; Inventory; Questionnaire; Scale; Test), 1053, 1128, 1455, 1921
 Survey research, 990, 1049, 1059, 2160
 Symbol, 1212
 Symbolic process, 1424
 Symbolism, 465, 984, 1230, 1770, 1761, 1775
 Sympathetic nervous system (See Nervous system/autonomic)
 Symposium, 605, 1098, 1209, 1588, 1859, 2159
 Symptom, 997, 1229, 1260, 1290, 1475, 1476
 System, 2062
 Tachistoscope, 172, 186, 515, 1341, 1397, 1785
 Tactual, 190, 262, 264, 688, 689, 1230
 Talent (See also Ability), 2001
 Tapping, 290
 Target, 2154, 2155
 Taste (See also Food), 144, 253, 255, 256, 257, 586, 601, 607, 613, 629, 684, 718, 725, 726, 728
 TAT (See also Thematic Apperception Test), 467, 1298, 1310, 1311, 1317, 1324, 1329, 2100
 Taylor Manifest Anxiety Scale, 380, 1059, 1242, 1328
 Teacher, 1151, 1878, 1934, 1971, 1983, 1993, 2018, 2019, 2021, 2022, 2024, 2025
 Teaching (See also next headings; Television/educational), 1855, 1862, 1867, 1868, 1873, 1880, 1881, 1882, 1904, 2023, 2106
 Teaching machine (See also Programmed instruction), 1887, 1888, 1898, 1908, 1909, 1911
 Teaching method, 121, 1866, 1875, 1884, 1886, 1896, 1903, 1906, 1907, 1909, 1913, 1926
 Teaching success, 1861, 1900
 Teaching/television (See Television/educational)
 Television/educational, 1172, 1175, 1193, 1982
 Temperature senses, 260, 263, 782
 Temporal lobe, 541, 543, 556
 Tension (See also Conflict; Stress), 337, 338, 627, 1371, 1637, 1844, 2166
 Test & testing (See also next headings; Air Force; Army; Bender-Gestalt; California Psychological Inventory; Draw-a-Man; Progressive Matrices Test; Projective technique; Rorschach; Sentence Completion; Stanford-Binet; Thematic Apperception), 43, 67, 461, 823, 888, 942, 975, 1013, 1312, 1604, 1613, 1671, 1680, 1706, 1711, 1788, 1812, 1870, 1881, 1893, 1930, 2038, 2048, 2055, 2181
 Test/intelligence, 1219, 1307, 1617, 1811, 1964, 1984, 1997, 2014
 Test/personality (See also specific tests), 1197, 1281
 Test/program, 1987, 1990
 Thalamus, 521, 532, 556, 557, 586, 610
 Thematic Apperception Test (See also TAT), 111, 928, 942, 1041, 1293, 1756
 Theory, 55, 165, 177, 196, 217, 469, 520, 886, 981, 983, 987, 1141, 1149, 1165, 1281, 1299, 1464, 1524, 1574, 1587, 1640, 1892
 Therapy (See also Occupational Therapy; Psychiatry; Psychoanalysis; Psychotherapy; Treatment), 317, 1383, 1389, 1396, 1425, 2032
 Thinking (See also Abstraction; Cognition; Reasoning), 89, 422, 470, 846, 870, 1148, 1153, 1583, 1621, 1768, 1785, 1993
 Thirst (See also Water deprivation), 562
 Threat, 499, 719
 Threshold (See also several modalities), 158, 166, 260, 276, 295
 Time (See also next headings), 300, 1986
 Time estimation, 162, 174, 314, 340, 648, 1233, 1580
 Tone (See also Audition), 540
 Tracking, 329, 330, 337, 733, 2069, 2074, 2142, 2145, 2152
 Traffic (See also Accident; Safety), 2167
 Training (See also next heading), 360, 361, 387, 734, 861, 920, 1291, 1875, 2030, 2073, 2102
 Training/psychology, 114, 1939, 1965, 2005
 Trait (See also Personality), 376
 Tranquilizer (See also Drug effects), 633, 664
 Transfer (See also Generalization/stimulus), 357, 362, 386, 398, 401, 405, 764, 873, 1186, 1874, 2069
 Transference, 1417, 1422, 2034
 Transposition, 527
 Trauma, 1474
 Treatment (See also Therapy), 1463, 1740, 1839
 Twins, 685
 Ulcer, 809, 1383, 1835
 Unconditioned, 758
 Unconscious, 1367
 Underachievement (See Achievement/over- & under-)
 Union, 2107
 Universities, 1969
 Urban (See also Community; Rural-urban), 1022, 1531
 Urination, 1700
 USSR, 19, 32, 89, 117, 166, 169, 190, 243, 289, 364, 477, 505, 547, 839, 861, 870, 1001, 1005, 1088, 1465, 1654, 1828, 1867, 1877, 1916, 2049, 2072, 2078, 2108
 Validity (See also next heading), 25, 1199, 1202, 1206, 1259, 1743, 1998, 2053
 Validity/construct, 1262, 1326
 Value, 1051, 1078, 1263, 1264, 1914, 1921
 Variable, 1008
 Variance/analysis of, 49, 52
 Verbal ability (See Ability/verbal)
 Verbal behavior, 468, 860, 1239, 1348, 1416, 1474, 1762, 1770, 1827
 Verbal conditioning (See Conditioning/verbal)
 Verbal learning (See Learning/verbal)
 Verbal mediation (See Mediation)
 Verbal reinforcement (See Reinforcement/verbal)
 Vestibular sense, 258
 Vigilance (See also Arousal; Attention), 254, 340, 343, 567, 1342, 1345, 2158, 2164, 2165
 Vision (See also next headings; Dark adaptation; Eye; Flicker fusion), 229, 329, 398, 440, 552, 605, 706, 724, 730, 1658, 1949
 Vision/binocular, 220
 Vision/brightness (See Brightness)
 Vision/color (See Color)
 Vision/eye movements (See Eye movements)
 Visual acuity, 225, 249
 Visual adaptation (See Dark adaptation; Light adaptation)
 Visual aftereffect (See Aftereffect)
 Visual cortex, 581, 582, 583, 594, 605
 Visual field, 220, 233, 2155
 Visual illusion (See Illusion)
 Visual movement (See Perception/motion)
 Visual perception (See also Aftereffect; Autokinetic effect; Illusion; Perception; Subception), 181, 206, 218, 223, 233, 333, 342, 387, 490, 1220, 2085, 2154
 Visual perception/depth (See Perception/depth)
 Visual perception/size (See Perception/size)
 Visual threshold (See also several kinds of thresholds), 242, 245
 Vocabulary, 200, 1787, 2038
 Vocation (See also Interest/vocational), 1690
 Vocational guidance (See Guidance/vocational)
 Vocational rehabilitation (See Rehabilitation/vocational)
 Voice, 1626, 1638
 Voting (See also Politics), 1042, 1054, 1065, 1072
 Vowel, 1161
 Wage, 2041, 2093
 Warmth (See also Temperature sense), 260
 Water (See also next heading), 693, 1045
 Water deprivation, 809
 Weber, 982
 Wechsler Adult Intelligence Scale, 966, 969, 973, 1210, 1609, 1698, 1998, 1203
 Wechsler-Bellevue Intelligence Scale, 671, 1214, 1706
 Wechsler Intelligence Scale for Children, 893, 975, 1205, 1495, 1609, 1667, 1704, 1752
 Wlt (See Humor)
 Woman, 952, 956, 1051, 1314, 1842
 Word (See also Association/word; Language), 449, 452, 454, 873, 2061
 Work (See also Job; Occupation), 146, 518, 1925, 1935, 2087, 2090, 2094, 2111, 2126
 Worker (See also Employee), 2028, 2042, 2098, 2101, 2127
 Writing (See also Handwriting), 839, 1176
 X-radiation (See Radiation)
 Youth, 816, 837, 881, 1010, 1073, 1756, 2001, 2039

Psychological Abstracts

VOLUME 37

APRIL 1963

NUMBER 2

EDITORIAL NOTES

This volume introduces a "Brief Subject Index." With present methods of preparing the annual Subject Index, it is possible to prepare and publish this brief index as a byproduct. The index supplements the classification of abstracts given in the Table of Contents and the headings throughout the issue. In order to limit the number of abstracts referred to under each index heading, the index does not duplicate information given in the classification. For example, abstracts classified under Adolescence are not referred to under that heading in the index. Abstracts classified under other headings, however, but having to do with Adolescence, are referred to under that heading in the index. Thus, the index replaces the cross-reference system formerly employed. In addition, it allows the reader to pinpoint subjects that are more specific than those used to classify the abstracts.

* * *

A new abstracting service entitled *International Abstracts in Operations Research* has begun quarterly publication. It is produced by the International Federation of Operational Research Societies, and is published by the Operations Research Society of America with subscription and business offices at Mount Royal and Guilford Avenues, Baltimore 2, Maryland. Subscription: \$12.50 (\$10.00 outside U.S. and Canada) an annual volume; single issues when available, \$3.50. The first issue contained 553 classified abstracts. In addition it contained a Digest giving in tabular form descriptive words or phrases concerning (a) principal result(s), (b) special aspects or specialization, and (c) technology employed. It also had author and subject indexes.

* * *

The Center for Programmed Instruction, Inc., 365 West End Avenue, New York 24, New York has begun the quarterly publication of the *Journal of Programmed Instruction* under the editorship of Lincoln F. Hanson. Its purpose is "to achieve the techniques, applications, theories, and methods of programmed instruction as a means for furthering scientific knowledge of the learning process and improving the rational basis of instruction." Annual subscription: \$7.50; foreign, \$8.00.

* * *

Academic Press, 111 Fifth Avenue, New York 3, New York, has begun the bimonthly publication of the *Journal of Verbal Learning and Verbal Behavior* under the editorship of Leo Postman. It will publish "articles dealing with laboratory studies of human learning as well as work in linguistics and related disciplines. . . . Theoretical papers with clear implication for current research are also acceptable." Annual subscription: \$15.00.

GENERAL

2183. Draper C. S. The inertial gyro: An example of basic and applied research. *Amer. Scientist*, 1960, 48, 9-19.—Abstract No. 35: 33 erroneously gave a different year, volume, and pagination than the above.

OBITUARIES

2184. Reuchlin, Maurice. In memoriam: Gaston Viaud. *Psychol. Franc.*, 1962, 7(1), 1-3.—C. J. Adkins.

HISTORY & BIOGRAPHY

2185. Ames, L. B. (Gesell Inst.) Dr. Arnold Gesell, 1880-1961. *Brit. J. educ. Psychol.*, 1962, 32(2), 101-102.—The article describes Gesell's contributions.—B. T. Jensen.

2186. Anon. Alphonse Chapanis. *Rev. Psychol. appl.*, 1961, 11(4), 343-347.—Portrait, brief biography, and 62-item bibliography.—W. W. Wattenberg.

2187. Anon. Georges Friedmann. *Rev. Psychol. appl.*, 1962, 12(1), 49-52.—Portrait and 97-item bibliography.—W. W. Wattenberg.

2188. Anon. John C. Flanagan. *Rev. Psychol. appl.*, 1962, 12(2), 135-138.—Portrait, biographical note, and 57-item bibliography.—W. W. Wattenberg.

2189. Burt, C. (9 Elsworthy Road, London, England) Galton's contribution to psychology. *Bull. Brit. Psychol. Soc.*, 1961, 45, 10-21.—A summary and evaluation of Galton's work and theoretical approach.—C. C. Kiernan.

2190. Fortmann, H. M. M. De godsdienstpsychologie van Jung. [The religious psychology of Jung.] *Gauein*, 1962, 10(5), 265-274.—Jung's psychology is actually a religious psychology, since no psychologist before or after him has concerned himself with religion as intensely as he did. The projection theory is considered the core of his doctrine, some basic principles of which are the subconscious, the archetypes, the symbol, and the self.—J. A. Lücker.

2191. Lennhoff, F. G. (Shotton Hall, Harmer Hill, Shrewsbury, England) Einige persönliche Erinnerungen an Alfred Adler. [Some personal recollections about Alfred Adler.] *Heilpädagog. Werkbl.*, 1962, 31(3), 98-99.—In connection with the 25th anniversary of Adler's death, the author describes his own encounters with Adler, observations on some of his habits, and his ways of meeting people. He illustrates how Adler's manners expressed his ideas, especially his acceptance of others, including colleagues, patients, children, or readers, as codiscoverers and partners.—D. F. Mindlin.

2192. Mátrai, László. (U. Budapest, Hungary) Henricus Regius (Le Roy) a tudományos lélektan úttörője. [Henricus Regius (Le Roy), the pioneer of scientific psychology.] *Psichol. Tanulmányok*, 1958, 1, 8-20.—The alliance between psychology and

philosophy became problematic in the 17th century at the time of the general acceptance of Descartes' system of philosophy. The novel trends in psychology were opposed to the idealistic principles of the Cartesian dualistic system of philosophy. Henricus Regius, professor of medicine at Utrecht University, pointed to and later eliminated the inner contradiction which existed between Descartes' materialistic physics and idealistic philosophy. His methodology and objective case presentation paved the way for the development of scientific psychology. (Portrait, Russian & English summaries)—*E. Friedman*.

2193. Skard, Åse Gruda. (U. Oslo) Seks som gjekk bort. [Six who are departed.] *Norsk pedagog. Tidsskr.*, 1962, 46(1), 1-5.—The scientific contributions of 6 recently deceased psychologists—Watson, Gesell, Goodenough, Harold Jones, Jung, and Margaret Curti—are briefly sketched.—*L. Goldberger*.

2194. Surányi, Gábor. Vlagymir Mihajlovics Bechterew. *Pszichol., Tannulmányok*, 1958, 1, 21-25.—On the occasion of the 100th anniversary of Bechterew's birth a description of his scientific career and the results of his psychological research work are presented. (Russian & English summaries)—*E. Friedman*.

2195. Thomas, Milton H. (Ed.) (Princeton) John Dewey: A centennial bibliography. Chicago, Ill.: Univer. Chicago Press, 1962. xiii, 370 p. \$6.50.—Dewey's writings from 1882 to 1960 are listed year by year in 153 pages; the table of contents for each book is given, and all items have brief comments concerning contents and circumstances of publication, e.g., talk, book review, critique, contributed chapter or introduction, and reprintings. A 2nd section of 138 pages consists of an alphabetically arranged bibliography of writings about Dewey, including replies to and analyses of, his philosophical and persuasive efforts. There is a 71 page, double-column index which is cross referenced to the 2 major sections of the book. Finally, there is a brief chronology of Dewey and a "compiler's note." Neither Dewey's writings nor the writings about him are numbered.—*R. A. Littman*.

2196. Tramer, F. (Brünn/CSR, Bratislavská 39/II) Friedrich Nietzsche und Sigmund Freud. [Friedrich Nietzsche and Sigmund Freud.] *Jb. Psychol. Psychother. med. Anthropol.*, 1960, 7(3-4), 325-350.—A study of the various writings of Nietzsche shows that one can find there a definite indication of the thought of the unconscious, guilt feeling, and the concept of conscience. It appears that the philosophical considerations of Nietzsche were picked up by Freud who then continued working on them and who incorporated them into his scientific approach.—*V. J. Bilioukas*.

2197. Valett, R. E. (U. Canterbury, New Zealand) Jung's effect on psychology. *Bull. Brit. Psychol. Soc.*, 1962, 46, 58-66.—The article represents an attempt to outline some of the main possibilities for research and clinical practice offered by analytic psychology.—*C. C. Kiernan*.

2198. Von Bracken, E. (Hausen Post Oberkin über Kirn/Nahe, Germany) Zum Problem einer Geschichte der Idee der Persönlichkeit. [On the problem of the history of the idea of personality.] *Psychol. Beitr.*, 1962, 7(1), 131-146.—4 stages of man's Self-understanding in the history of western

thinking are mentioned: the anthropological period of Greek philosophy, Descartes' concept of the "I," Goethe's and Schleiermacher's concept of personality, the concrete historical existence of man as a "single" man, and the personality research in psychology. The author attempts to find significant forms of the idea of man in various epochs in order to understand the history of the sublimation of human self-understanding in the idea of personality. (English & French summaries)—*H. J. Priester*.

2199. Wallin, J. E. W. (Lyndalia, Del.) Reminiscences from pioneering days in psychology, with a few personality portraits. *J. gen. Psychol.*, 1962, 67, 121-140.—A record of pioneering explorations in the fields of psychology, philosophy, education, and mental pathology on the undergraduate, graduate, and postdoctoral levels at Augustana, Yale, Clark, Michigan, Princeton, East Stroudsburg Training School, the Training School at Vineland, and the State Village for Epileptics in New Jersey. The record documents the experiences that eventually led the writer to adopt clinical psychology and the rehabilitation of handicapped children (especially mental retardates) by psychoeducational services as a life career. Personality delineations are made of the author's outstanding professional associates: Edward Fry Bartholomew, Edward W. Scripture, George Trumbull Ladd, G. Stanley Hall, Robert M. Wenley, J. Mark Baldwin, Woodrow Wilson, and others. The disruption of the Yale department of philosophy in 1901 is briefly chronicled.—*Author abstract*.

THEORY & SYSTEMS

2200. Alvim, Francisco. Troubles de l'identification et image corporelle. [Difficulties in identification and body image.] *Rev. Franc. Psychanal.*, 1962, 26(1), 5-116.—From his clinical practice, the author seeks a unitary theory underlying medicine, neurology, and psychoanalysis. Phenomenology, clinical examples, genesis and development of body image, structure, economy, and metapsychology of body image are presented toward this end.—*G. Rubin-Rabson*.

2201. Arian, E. La coscienza e il secondo sistema di segnalazione. [Conscience and the secondary signal system.] *Riv. Psicol. soc.*, 1961, 28(3-4), 263-275.—Pavlov's and recent neurophysiological findings are related to complex verbal and higher processes.—*L. L'Abate*.

2202. Blalock, H. M., Jr. Spuriousness versus intervening variables: The problem of temporal sequences. *Soc. Forces*, 1962, 40(4), 330-336.—A method is described and exemplified for making causal inferences when temporal sequences are in doubt. Required are linear relationships and "the assumption that variables not included in the causal system are operating in such a manner as not to disturb the patterns of intercorrelations." The method does not require the assumptions that all relevant variables have been controlled or that measurement error is lacking.—*A. R. Howard*.

2203. Bolsi, D., & Torre, M. Coscienza individuale e coscienza sociale: Aspetti psicopatologici. [Individual and social conscience: Psychopathological aspects.] *Riv. Psicol. soc.*, 1961, 28(3-4), 223-233.—The theories of Janet and Piaget are discussed from the viewpoint of their relevance to psychopathological aspects of conscience.—*L. L'Abate*.

2204. **Burt, Cyril.** (University Coll. London, England) **The concept of consciousness.** *Brit. J. Psychol.*, 1962, 53(3), 229-242.—The object of the following paper is to criticize the current practice which takes behaviour rather than consciousness to be the defining characteristic of psychology. It is argued that consciousness must be regarded as a generic term covering (a) certain specific relations (e.g., intuitive awareness), and (b) certain specific contents (e.g., sense-data, mental images, feelings, etc.). Both relations and contents are directly given; both are unique phenomena of sufficient importance, practically as well as theoretically, to deserve systematic study in their own right. The methods available for studying them necessarily include introspection; and this, it is contended, is as valid as any other mode of observation. Detailed instances are given, showing how the neglect of introspective procedures leads to descriptions of human behaviour which are not only incomplete but frequently misleading.—*Journal abstract.*

2205. **Gladin, L. L.** (Probation Dept., San Diego County, Calif.) **Toward a unified psychology.** *Psychol. Rec.*, 1961, 11, 405-421.—“The present paper has been concerned with a series of issues having to do with the possible establishment of a metascience addressed to the special problems of a unique science, psychology. Under the assumption that psychology is not a physical science, dualism was advanced as the forte of its uniqueness and supported on the grounds of its inevitability in a science which has to do with an organismic domain whose subjective core has persisted in remaining significant. The communication process was discussed at length in terms of its implications for the sciences in general and psychology in particular. The nature and function of knowledge was considered as it bears on psychology's metascience and necessary definition, and with regard to the human's task of affiliation with his animate and inanimate surround.”—*P. J. Seidel.*

2206. **Guilford, J. P.** **An informational view of mind.** *J. psychol. Res., Madras*, 1962, 6(1), 25-34.—“Organism is an inform-processing agent rather than a passive and touch-and-go mechanism.” The structure-of-intellect model of mind is a 3-dimensional, morphological model in which 3 varieties of intersecting categories are represented. The abilities differ according to perceptual, psychological, and content categories. This model defines the traditional concepts in a better way.—*U. Pareek.*

2207. **Kardos, Lajos.** **Grundfragen der Psychologie und die Forschungen Pawlows.** [The basic questions of psychology and Pavlov's research.] Budapest, Hungary: Akademiai Kiado, 1962. 396 p.—A presentation of Pavlov's research and its implications for a modern “dialectically-materialistic” psychology. The author systematically applies Pavlov's research and theoretical principles to human psychology. A broad exposition of Pavlovian concepts of higher nervous activity is followed by an application of these concepts to perception, memory, thinking, development of speech, and emotion and will.—*J. B. Thompson.*

2208. **Kors, Pieter C.** (Four Winds, Katonah, N. Y.) **The organo-dynamism theory of Henry Ey.** *J. nerv. ment. Dis.*, 1962, 134(6), 566-571.—The advantages of Henry Ey's organo-dynamism theory over the theories of Kraepelin and Bleuler are

discussed. Ey's theory integrates the thinking of Freud, Janet, and Hughlings Jackson.—*N. H. Pronko.*

2209. **Lüscher, Max.** (St. Jakobstr. 81, Basel, Switzerland) **Die Methode der strukturellen Funktionspsychologie.** [The method of structural functional psychology.] *Heilpädagog. Werkbl.*, 1962, 31(2), 65-69.—This is said to be the 1st report of a new theoretical model of personality. It is based on the “functional psychology” theory started 20 years ago in Switzerland by Paul Häberlin, and attempts to integrate concepts of Wundt with those of Karen Horney, also incorporating some ideas of other Freudians and neo-Freudians. Lüscher calls his version: “structural functional psychology.” He utilizes 3 “logical” categories for his 3-dimensional model: “direction,” “position,” and “function” which are represented geometrically in the form of a cube. “Direction” is defined along the dimension of self-directed vs. other-directed; “position” ranges from self-determined to determined (or influenced) by others; “function” is the dimension of affective values, going from negative to positive. There is discussion of interdependence and compensation of functions in this model of personality structure. At the center of the cube the theory provides for “self-regulation.” The author states that this model provides laws by which behavior and its motivation can be accurately predicted.—*D. F. Mindlin.*

2210. **Marek, J.** **Percezione sociale e attribuzione di significato.** [Social perception and attribution of meaning.] *Riv. Psicol. soc.*, 1961, 28(3-4), 239-253.—Experiments on influence of social context upon individual perceptions and the contribution of individual perception upon social context are related to the thinking of Wertheimer and Heider.—*L. L'Abate.*

2211. **Sokolov, E. N.** **Vospriatie i uslovnyy reflex.** [Perception and the conditioned reflex.] Moscow, USSR: Publishing House Moscow Univer., 1958. 333 p.—The author presents in this book a selection of the studies devoted to an investigation of the reflex bases of the perceptual process from the point of view of Pavlov's theory of the conditioned reflex. The studies, undertaken in the period 1952-57 and reported in this book, are devoted, in the main, to the interrelations of the orienting, adaptive, and defensive reflexes which participate in the actualization and regulation of the sensory processes.—*I. D. London.*

2212. **Van Luijk, H.** **Het statuut van de godsdienstpsychologie.** [The statute of religious psychology.] *Gawein*, 1962, 10(5), 236-264.—An effort is made to outline the methodological statute, strictly within the limits of direct psychological evaluation, of the religious symptoms revealed to religious persons. The thesis is presented that only the religious psychologist can study religious psychology to its fullest extent and with complete awareness of the validity of its results. Answers are sought for 3 leading questions: what exactly are religious symptoms for the psychologist; what is the significance of a theory explaining the psychological meaning of these symptoms; and what bearing does this explanation have on theology.—*J. A. Lücker.*

2213. **Wann, T. W., & Walker, D. E.** (Rice U.) **Whittaker's “postulates of impotence” and theory in psychology.** *Psychol. Rec.*, 1961, 11, 383-393.—“In understanding the place of theory in psychology, it is strategically important for psychologists to accept

or reject two 'postulates of impotence' (Whittaker). The postulate of conceptual impotence forces us to recognize the arbitrary nature of our psychological terms and the irreducible uncertainty as to their referents. The postulate of operational impotence maintains that not only does the relative nature of our concepts render us impotent, but that the tools of investigation, be they observation, experimentation, or instrumentation, also are confounding our indices of a real world." Consideration of these is discussed as logically prior to the current arguments concerning the relative merits of the summary, heuristic, or formalistic view of theory in science.—R. J. Seidel.

2214. Wegeler, A. (Otto-Bauer-Gasse 5, Vienna, Austria) *Die Personalisation*. [Becoming a person.] *Jb. Psychol. Psychother. med. Anthropol.*, 1960, 7(3-4), 217-227.—This article represents the principle ideas of the Vienna Circle for Depth Psychology. The concept of person is discussed from 2 standpoints: as a static philosophical concept and as a psychological concept which includes the process of becoming. The becoming includes a continuous balance of tension between the individual and the environment. In order to become a person, one must "transcend" the self or oneself, accept the socialization, and still maintain his freedom. The most recent ideas on the topic by various philosophers and existentialists are reviewed and the references include 28 publications.—V. J. Bieliauskas.

PHILOSOPHY

2215. Christian, P. (Heidelberg, Germany) *Zur Phänomenologie des leiblichen Daseins*. [On the phenomenology of the bodily existence.] *Jb. Psychol. Psychother. med. Anthropol.*, 1960, 7(1-2), 2-9.—The bodily existence is a mode of human existence, and as such it is taking part in the dignity, uniqueness, and singularity characteristic of the features of a person. Existentialists including philosophers, psychiatrists, and psychologists such as: Merleau-Ponty, Sartre, G. Marcel, Buytendijk, V. Gebattel, E. Strauss, Zutt, and Plügge have been trying to develop a phenomenology of the bodily existence. This article summarizes and evaluates the ideas of the above authors and emphasizes the importance of proper understanding of human corporeal existence, its meaning, and its value-relationship for the study and understanding of psychological processes.—V. J. Bieliauskas.

2216. Delgado, R. R., & Delgado, J. M. R. (Yale U.) *An objective approach to measurement of behavior*. *Phil. Sci.*, 1962, 29(3), 253-268.—The behavior of the observed system always involves the behavior of the observing system. Systematic principles for defining measurement and the units of behavior are laid down, such that description of behavior in terms of its "individual," "social," "systematic," and "role" units can be the subject of logico-mathematical treatment.—M. Turner.

2217. Ledermann, E. K. (Marlborough Day Hosp., London, England) *Existentialism and psychiatry*. *Comment on the article by Frank Fish*. *J. ment. Sci.*, 1962, 108 (Whole No. 455), 525-527.—Validity of existential philosophy for psychiatry is defended by reference to key ideas in the writings of Jaspers and emphases in Binswanger.—W. L. Wilkins.

2218. Leibbrand, Werner. (U. Munich) *Die Leib-Seele-Antinomie in der Medizingeschichte*

des Abendlandes. [The opposition of body and mind in the history of western medicine.] *Prax. Psychother.*, 1962, 7(3), 90-104.—A brief survey of the mind-body problem in western philosophical and religious thought from Pythagoras through Hildegard of Bingen to contemporary theorists which was the opening address at the 12th Lindau Psychotherapy Week by the Director of the Institute for the History of Medicine in Munich.—W. Swartley.

2219. Myers, C. M. (Northern Illinois U.) *Perceptual events, states, and processes*. *Phil. Sci.*, 1962, 29(3), 285-291.—"One who observes a perceiver knows the perceiver's perception in a categorically different way than the perceiver knows it. From this it can be seen that perceptual events, states, and processes have both a physical aspect and an epistemological aspect. Any attempt to reduce one of these aspects to the other would involve a category mistake."—M. Turner.

2220. Mourélos, Georges. *L'épistémologie positive et la critique meyrsonienne*. [Logical positivism and Meyerson's critique.] Paris, France: Presses Universitaires France, 1962. 230 p. NF 18.—An account of the progress of French thought in the domain of the philosophy of science that attempts to highlight some of the major themes of this thought as they exist in contemporary epistemology. It traces the development of scientific rationalism from Descartes through d'Alembert and the positivism of Auguste Comte, criticizing the opposing philosophy of Émile Meyerson with the help of the applied rationalism of Gaston Bachelard.—G. H. Mowbray.

2221. Shelly, M. W. (Office Naval Research) *There are many sciences of man*. *Percept. mot. Skills*, 1962, 14(1), 97-98.—The author's position is that there are many sciences of man because prediction is not the only criterion used to admit something as belonging to a science of man. These sciences of man will remain nonequivalent at least as long as they lack a common formal language. The question of the truth of any single science of man, should a single one emerge, remains, however, as an inquiry of a possibly nescient tomorrow.—W. H. Guertin.

STATISTICS

2222. Elston, R. C., & Grizzle, J. E. *Estimation of time-response curves and their confidence bands*. *Biometrics*, 1962, 18(2), 148-159.—The longitudinal study of Ss is complicated because of the correlation between the responses at different time points. Confidence bands for the growth curve, and its parameters, can still be obtained by modifying well-known methods. A multivariate method and 2 univariate methods are examined and compared analytically by using an example of the growth of the Ramus bone in boys.—R. L. McCornack.

2223. Harris, Chester W. (U. Wisconsin) *Some problems in the description of change*. *Educ. psychol. Measmt.*, 1962, 22(2), 303-319.—5 methods of measuring change are listed and reduced to 3 different types. 4 methods of analysis of change are described: (a) factoring of the interrelationships, (b) canonical factor analysis of the supermatrix, (c) canonical analysis of the supermatrix, and (d) an interbattery method of analysis. The derivation of the various methods of analysis is shown, and the usefulness of each method is discussed.—W. Coleman.

2224. Holtzman, Wayne H. (U. Texas) **Meth-
odological issues in P technique.** *Psychol. Bull.*, 1962, 59(3), 248-256.—The P technique is a multiple time series in which observations are taken in a definite time series and usually consists of measures which are not independent. This lack of independence creates statistical problems which are examined. Much work is needed on the fundamental theory of analysis of multiple time series.—W. J. Meyer.

2225. Leiderman, P. Herbert, & Shapiro, David. (Harvard Medical School) **Application of a time series statistic to physiology and psychology.** *Science*, 1962, 138(Whole No. 3537), 141-142.—A statistic describing variability for continuously collected time-ordered data with changing mean level is presented. The Mean Square Successive Difference, developed by von Neumann, was employed in the analysis of basal levels of galvanic skin potential recorded for 40-minute periods.—*Journal abstract.*

2226. Rimoldi, H. J. A., & Haley, John V. (Loyola U., Chicago) **Determining significance levels in pattern analysis.** *Psychol. Rep.*, 1962, 10(2), 500.—The method of Pattern Analysis and indexes of agreement previously developed by the authors are applied to results from experts and junior and senior medical students on a Test of Diagnostic Skills.—B. J. House.

2227. Shepard, Roger N. (Bell Telephone Lab.) **The analysis of proximities: Multidimensional scaling with an unknown distance function. Part II.** *Psychometrika*, 1962, 27(3), 219-246.—The 1st in the present series of 2 papers described a computer program for multidimensional scaling on the basis of essentially nonmetric data. This 2nd paper reports the results of 2 kinds of test applications of that program. The 1st application is to artificial data generated by monotonically transforming the interpoint distances in a known spatial configuration. The purpose is to show that the recovery of the original metric configuration does not depend upon the particular transformation used. The 2nd application is to measures of interstimulus similarity and confusability obtained from some actual psychological experiments.—*Journal abstract.*

2228. Spicer, C. C. **Some new closed sequential designs for clinical trials.** *Biometrics*, 1962, 18(2), 203-211.—Dichotomies such as "cured" or "not cured" may be used to compare 2 treatments using a new class of 2-decision closed sequential trials. Only trials in which one treatment is superior are examined. The properties of such designs were studied using a computer for exact calculations.—R. L. McCornack.

Experimental Design

2229. Alimena, Benjamin S. (Manhattan Coll.) **A method of determining unbiased distribution in the Latin-square.** *Psychometrika*, 1962, 27(3), 315-318.—The paper describes a method of constructing Latin-square designs in which treatment sequences are unbiased with regard to serial order as well as position of treatment. The procedure is useful for those Latin squares in which the number of cells in each column (or row) is an even number, which when written in ascending and descending series, contain corresponding ordered numbers prime to each other. Such numbers are 2, 4, 6, 10, 12, 16, 18, 22, 28, 30, 36, etc.—*Journal abstract.*

2230. Fisher, Seymour. (National Inst. Mental Health, Bethesda, Md.) **Use of chi-square in simple crossover designs.** *J. ment. Sci.*, 1962, 108(Whole No. 455) 406-410.—Ignoring the correlation within patients who are exposed to 2 different treatments in a crossover design may obscure valid differences in outcome. Chi-square analysis may be appropriate but must be based on independent observations.—W. L. Wilkins.

2231. Tikhomirov, O. K. (Moscow State U., USSR) **Issledovanie optimal'nykh sposobov proverki gipotez v norme i patologii: Soobshchenie IV. Zavisimost' optimal'noi posledovatel'nosti prob ot apriornoi veroiatnosti gipotez.** [Optimal procedures for testing hypotheses in normal and pathological cases: Communication IV. Dependence of optimal sequence of tests upon the expected probability of hypotheses.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1962, No. 1, 73-76.—The task was to recognize 4 letters of Russian alphabet reproduced with checkers on a board of 25 cells. The letters were presented under conditions of equal and different probability of occurrence. It was established that "the optimal sequence of tests in relation to the cells of the square depends upon the expected (a priori) probability of hypotheses about the unknown figures."—A. Cuk.

Formulas & Calculations

2232. Harris, Chester W. (U. Wisconsin) **Some Rao-Guttman relationships.** *Psychometrika*, 1962, 27(3), 247-264.—An examination of the determinantal equation associated with Rao's canonical factors suggest that Guttman's best lower bound for the number of common factors corresponds to the number of positive canonical correlations when squared multiple correlations are used as the initial estimates of communality. When these initial communality estimates are used, solving Rao's determinantal equation (at the first stage) permits expressing several matrices as functions of factors that differ only in the scale of their columns; these matrices include the correlation matrix with units in the diagonal, the correlation matrix with squared multiple correlations as communality estimates, Guttman's image covariance matrix, and Guttman's antiimage covariance matrix. Further, the factor scores associated with these factors can be shown to be either identical or simply related by a scale change. Implications for practice are discussed, and a computing scheme which would lead to an exhaustive analysis of the data with several optional outputs is outlined.—*Journal abstract.*

2233. Kincaid, W. M. **The combination of 2 X m contingency tables.** *Biometrics*, 1962, 18(2), 224-228.—Data consisting of proportions of visual stimuli detected out of a fixed number presented at each of several intensities during each of several experimental sessions can be represented as a set of contingency tables. These contingency tables may be combined if the probability of detection did not differ for the several sessions. A method is proposed and applied.—R. L. McCornack.

2234. Lorr, M. (Veterans Benefits Off., Washington, D. C.) **Relations between the intraclass correlation and the Kuder-Richardson reliability formulas.** *J. clin. Psychol.*, 1960, 16(4), 447-450.—"The Kuder-Richardson reliability formulas #20 and

#21 have been shown to be identical to several forms of the intraclass correlation coefficient. Simple computational formulas for dichotomous and continuous variables involving only sums and sums of squares were presented, and applied on several examples. The role and effects of observer (item) variance in the K-R formulas has been highlighted."—*V. J. Bieliauskas.*

Factor Analysis

2235. **Cliff, Norman.** (U. Southern California) **Analytic rotation to a functional relationship.** *Psychometrika*, 1962, 27(3), 283-296.—It is suggested that a number of theoretical models for non-test data can be tested by factor analysis. A traditional method for transforming principal-axis factor solutions is used as an aid in making such tests; a modification of this method is suggested. Means of using all of the information in a model for the purpose of determining the transformation of the arbitrary factor solution are presented, and an illustrative example is given.—*Journal abstract.*

2236. **Dingman, Harvey F., & McIntyre, R. B.** (Pacific State Hosp.) **Determining weights for composite ratings by factor analysis.** *Psychol. Rep.*, 1962, 10(2), 475-480.—"A general formula for obtaining weighted composites of ratings which can use different types of information was reviewed. Its applicability in situations where unitary evaluation criteria are not appropriate was presented in reference to supervisory ratings of employees in a mental hospital. The general utility of the procedure was discussed."—*B. J. House.*

2237. **Ross, John.** (U. Western Australia) **Informational coverage and correlational analysis.** *Psychometrika*, 1962, 27(3), 297-306.—The question "How much does a set of variables tell us?" is formulated in terms of information measures, and a set of formulas is established which allows appropriate information measures to be derived from correlations. Particular attention is given to the question in the context of factor analysis and to formulas involving the latent roots of correlation matrices.—*Journal abstract.*

2238. **Thompson, John W.** (University Coll., N. Staffordshire, England) **Meaningful and unmeaningful rotation of factors.** *Psychol. Bull.*, 1962, 59(3), 211-223.—Although electronics will make undisputable unique solutions possible, there still will be room for judgmental and objective methods. Insufficient regard is paid to the distribution and size of loadings within individual factors. Several concepts are examined which might lead to greater discrimination in the analysis of different types of data and prove useful for factor rotation. The technique of rotation employed should depend on the nature of the data.—*W. J. Meyer.*

GENERAL BOOKS & REFERENCE WORKS

2239. **Dyal, James A.** (Texas Christian U.) **Readings in psychology: Understanding human behavior.** New York: McGraw-Hill, 1962. x, 444 p.—The 56 selections, some abridged, emphasizing human behavior, are grouped into 13 chapters covering the conventional introductory topics. Within chapters, selections are grouped under biological, psychological, and sociocultural factors. 19 selections are from books; 13 selections from pre-1950 publications,

and 3 selections from post-1959 sources. Original references omitted.—*R. S. Harper.*

2240. **Kostiuk, G. S. (Ed.)** **Pitannia psikhologii.** [Problems of psychology.] Kiev, USSR: Radians'ka Shkola, 1959. 288 p.—This is Volume 10 of *Naukovi zapiski* [Scientific notes], published by the Research Institute of Psychology under the auspices of the Ukrainian Ministry of Education. It consists of reports of experiments on individual differences in the interaction of the 2 signal systems in: (a) formation of motor habits, (b) transition from a slower to a faster work tempo, and (c) functioning of automatized motor habits while S is simultaneously engaged in unrelated mental activity. (Text in Ukrainian with Russian summary)—*I. D. London.*

2241. **Levitov, N. D.** **Detskaia i pedagogicheskaia psikhologiya.** [Child and pedagogical psychology.] Moscow, USSR: Uchpedgiz, 1958. 323 p.—This is an introductory text for use in pedagogical institutes.—*I. D. London.*

2242. **Rosenblith, Judy F., & Allinsmith, Wesley. (Eds.)** **The causes of behavior: Readings in child development and educational psychology.** Boston, Mass.: Allyn & Bacon, 1962. xii, 514 p. \$6.50.—80 selections are organized under 11 sections representing various determinants of behavior. Introductions to each section contain brief descriptions of the articles within and suggest additional readings. The selections represent a wide diversity of theoretical positions and systems of psychology.—*W. L. Faust.*

2243. **Sells, S. B.** **Essentials of psychology.** New York: Ronald, 1962. xiv, 513 p. \$6.50.—A textbook designed for the introductory course in psychology with particular emphasis on the "idea that psychology is the science which is most intimately concerned with the behavior of man." The material covered is organized into 4 parts: Part I, "General Orientation" ("The Science of Psychology"); Part II, "General Processes of Behavior" ("The Learning Process," "Receptor Process," "Perception," "Motivation of Behavior," "Emotions, Frustration, and Stress," and "Adjustment and Self-Defense"); Part III, "Individuality" ("Abilities and Intelligence," "Personality," and "Measurement of Personality"); and Part IV, "Group Processes" ("Formation and functioning of Natural Groups," "Dimensions of Groups," and "Group Operation in Industry").—*M. J. Wayner, Jr.*

ORGANIZATIONS

PROFESSIONAL PROBLEMS

2244. **Ammons, C. H., & Ammons, R. B.** (Montana State U.) **Permanent or temporary journals: PR and PMS become stable.** *Psychol. Rep.*, 1962, 10(2), 537.—"Much recent printing of scholarly material in psychology has been on papers which deteriorate rapidly, often discoloring and becoming brittle in less than a hundred years. Starting with their 1962 volumes, *Psychological Reports* and *Perceptual and Motor Skills*, as well as all reprints from them, are being printed on a new acid-free paper which should hold up in use for hundreds of years."—*B. J. House.*

2245. **Jahoda, M.** (Brunel Coll., Acton, England) **The establishment of a new psychology department.** *Bull. Brit. Psychol. Soc.*, 1962, 48, 25-29.—

The author discusses the basic considerations which have been taken into account.—C. C. Kiernan.

2246. **Pepinsky, Harold B., & Borow, Henry.** *Research frontier.* *J. counsel. Psychol.*, 1961, 8(4), 363-367.—A discussion of psychological investigation of religious questions with some examples of proposed research.—E. R. Oetting.

Psychological Personnel

2247. **Babchuk, Nicholas, & Bates, Alan P.** *Professor or producer: The two faces of academic man.* *Soc. Forces*, 1962, 40(4), 341-348.—The publications, current institutional affiliation, and professional identification of 262 sociologists reveal that the latter belong to "two distinct professional communities." The community of disciplinary specialists is associated with high productivity, membership in the American Sociological Association, and affiliation with a major university. The community of college teaching is associated with lower productivity and Association membership and affiliation with 4-year colleges.—A. R. Howard.

2248. **Drenth, P. J. D.** *De volwassenheid van de psychologie in het geding.* [The maturity of psychology is questioned.] *Mens Onderneming*, 1962, 16(4), 213-221.—Da Silva's opinion (see 36: 5AK43D) concerning the psychologist's immaturity is commented upon. The possible integration of the professional psychologist in an industrial setting and advantage of psychological schooling for many non-psychological functions are stressed.—J. A. Lückner.

2249. **Mensch, I. N.** (U. California, Los Angeles) *Psychologists in medical student selection in the U.S.A.* *Bull. Brit. Psychol. Soc.*, 1962, 47, 12-16.—A brief review of the position, tasks, and results of psychological testing in this area. (26 ref.)—C. C. Kiernan.

2250. **Mill, C. R.** (Dept. Mental Hygiene & Hosp., Richmond, Va.) *Interprofessional awareness of roles.* *J. clin. Psychol.*, 1960, 16(4), 411-413.—"In this study job descriptions given by employees in five hospital professions were rated and compared. The results suggest that psychology and psychiatric social work are understood better than the other professions. The jobs of the physicians and nurses are least understood. Psychologists and social workers also appear to have the best understanding of the other professions, while the physicians show the least understanding of their co-workers."—V. J. Bieliasukas.

Training in Psychology

2251. **Audley, R. J.** (University Coll., U. London) *Mathematical models in psychological investigations.* *Bull. Brit. Psychol. Soc.*, 1962, 46, 29-33.—It is argued that since one is prepared to give extensive undergraduate training in mathematical techniques for the analysis of experiments, some introduction to similar techniques in theory construction should also be provided.—C. C. Kiernan.

2252. **Felix, Robert H.** (National Inst. Mental Health) *The psychiatric training of the medical student and the psychiatrist.* *Bull. Menninger Clin.*, 1961, 25(5), 213-224.—Developments in psychiatric training during the past decade include a greater emphasis upon research and upon training in the behavioral sciences, and a move toward integrating psychoanalysis into the framework of a university or medical school.—W. A. Varvel.

2253. **Fraser, Elizabeth D.** (U. Aberdeen) *The teaching of statistics to psychology students.* *Bull. Brit. Psychol. Soc.*, 1962, 46, 11-16.—The author suggests that one difficulty in teaching statistics is the reluctance of students to do mathematics. She claims that this reluctance may be overcome through the performance and analysis by the students of experiments which they themselves have devised.—C. C. Kiernan.

2254. **Gathercole, C. E., Colwell, J. J. K., & Ben-Harari, M.** (Southern General Hosp. U. Glasgow) *Training of clinical psychologists in the University of Glasgow.* *Bull. Brit. Psychol. Soc.*, 1962, 46, 53-57.—A combined academic and in-service postgraduate training scheme is described.—C. C. Kiernan.

2255. **Greening, Thomas C.** (Psychological Service Ass.) *Post-doctoral training in psychotherapy: Four dilemmas.* *Psychol. Rep.*, 1962, 10(2), 343-347.—A discussion of needs and motivations typical of a recent PhD which are inconsistent with the requirements of post-doctoral training. "The intent of this paper is to bring these factors into clearer focus so that training programs will not founder on unrealistic estimates of the motivations and capacities of new PhD psychologists."—B. J. House.

2256. **Maxwell, A. E.** (Maudsley Hosp., London, England) *Experimental design.* *Bull. Brit. Psychol. Soc.*, 1962, 46, 17-22.—The necessity for training in the appraisal of experimental design is emphasized. Methods of introducing students to statistical methodology and experimental design through the study and critical discussion of actual experiments are outlined.—C. C. Kiernan.

2257. **Mayman, M.** (Menninger Found.) *Post-doctoral training for clinical competence.* *J. prof. Tech.*, 1962, 26(3), 305-309.—Patterns and goals in postdoctoral training programs are presented. The author expresses a preference for increased attention to scientific aspects of psychology to correct deficiencies in present graduate programs. Difficulties in a graduate program's simultaneously providing adequate professional training and academic foundations for developing clinical competence are described.—A. Greenwald.

2258. **Shepherd, M.** (Maudsley Hosp., London, England) *Department of Psychiatry at the Institute of Psychiatry, University of London.* *Bull. Brit. Psychol. Soc.*, 1961, 44, 29-35.—A report of research and teaching programmes in execution.—C. C. Kiernan.

2259. **Summerfield, A.** (Birkbeck Coll., U. London) *Statistical inference.* *Bull. Brit. Psychol. Soc.*, 1962, 46, 23-28.—The author argued that since experimental inferences depend on statistical inference, giving an understanding of the latter should be one of the prime objects of those teaching statistics to psychology students. It is suggested that a grasp of basic principles can be given without recourse to mathematical arguments.—C. C. Kiernan.

2260. **World Health Organization, Expert Committee on Mental Health.** *The undergraduate teaching of psychiatry and mental health promotion.* *WHO tech. Rep. Ser.*, 1961, No. 208. 36 p.—Undergraduate medical education should give the "undergraduate an understanding of normal psychological development and of the origin and nature of common psychological disorders equal to that already

provided in the organic field." It would be directed "not only to the training of future psychiatrists but also, and even predominantly, to the preparation of the physician for general practice."—*J. C. Franklin.*

PSYCHOLOGY ABROAD

2261. Broadhurst, P. L., & Martin, Irene. (Maudsley Hosp., London, England) **Comparative and physiological psychology in Britain: 1960.** *Bull. Brit. Psychol. Soc.*, 1961, 45, 41-55.—A brief summary of the research fields covered in British centers. (175 ref.)—*C. C. Kiernan.*

EXPERIMENTAL PSYCHOLOGY

2269. American Psychological Association, Division of Experimental Psychology. **Computer applications to psychological research.** *Behav. Sci.*, 1962, 7(3), 396-417.—The following papers were presented at a symposium at the American Psychological Association annual meeting on 3 September 1961: Charles F. Wrigley, "Introduction: The Increasing Use of Computers"; B. W. White, "Computer Applications to Psychological Research: Studies in Perception"; R. F. Simmons, S. Klein, and K. McConlogue, "Toward the Synthesis of Human Language Behavior"; H. Borko, "Computer Simulation of Neurophysiological and Social Systems"; and J. C. Lingoes, "Information Processing in Psychological Research."—*J. Arbit.*

2270. Bell, C. R. (U. Oxford) **Personality characteristics of volunteers for psychological studies.** *Brit. J. soc. clin. Psychol.*, 1962, 1(2), 81-95.—Pertinent literature is examined under 5 headings; unconventionality, adjustment, anxiety, social extraversion, and need achievement. Most volunteer bias studies have centered on expressed willingness to participate; this may not be the same as actual participation in the experimental situation. It is not yet possible to provide adequate experimental controls based on the prediction of magnitude and direction of sources of volunteer bias. (63 ref.)—*C. M. Franks.*

PSYCHOPHYSICS

2271. Eisler, Hannes. (U. Stockholm, Sweden) **Empirical test of a model relating magnitude and category scales.** *Scand. J. Psychol.*, 1962, 3(2), 88-96.—The function $K = a \log(\psi + q/k) + \beta$ seems to describe the relation between category scale values K and subjective magnitudes. The additive constant q/k is obtained from the standard deviations of the magnitude estimates. The model was empirically confirmed for the loudness and softness of white noise scaled by the methods of magnitude estimation and category rating.—*Journal abstract.*

2272. Eisler, Hannes. (U. Stockholm, Sweden) **On the problem of category scales in psychophysics.** *Scand. J. Psychol.*, 1962, 3(2), 81-87.—In the 1st part of the paper it is shown that, if 3 assumptions are granted, the category scale must be logarithmically related to the magnitude scale: $K = a \log \psi + \beta$. In the 2nd part of the paper, the relation $K = a \log(k\psi + q) + \beta$ is derived, starting from the assumptions that the category scale is a pure function of discrimination and that discrimination is appropriately described by the linear generalization of Weber's law for prothetic continua. We can reconcile these 2 formulas by defining the zero-point of the magnitude scale as the point where variability vanishes.—*Journal abstract.*

2273. Lhamon, W. T., Edelberg, R., & Goldstone, S. (Houston State Psychiatric Inst.) **A comparison of tactile and auditory time judgment.** *Percept. mot. Skills*, 1962, 14(3), 366.—Recent experiments demonstrated that a longer visual than auditory stimulation is judged equivalent to Ss concept of 1 second. Ascending and descending judgments of "more" or "less" in this study showed auditory stimulation to be judged significantly longer than tactile.—*W. H. Guertin.*

PERCEPTION

2274. Adams, D. K. (Duke U.) **Perceiving the world of others.** *Psychol. Beitr.*, 1962, 6(3-4), 416-425.—It is argued: (a) that our perceptions of the subjective situation of another have the same epistemological status as any other perceptions: (b) that the nervous mechanisms mediating such perceptions are a subclass ("analogomorphic") of the ratiomorphic processes evolved for the perception of Gestalten, constant objects, and causes; and (c) that the perception of the world of another is as objective as any other perception and subject to the same tests. (French & German summaries)—H. J. Priester.

2275. Ammons, R. B., & Ammons, C. H. (Montana State U.) **Perception bibliography: I. Introduction.** *Percept. mot. Skills*, 1962, 14(3), 509-510.—Explanation of a project to publish a cumulative bibliography on perception going back to 1894.—W. H. Guertin.

2276. Ayres, J. J., & Harcum, E. R. (Coll. William & Mary) **Directional response-bias in reproducing brief visual patterns.** *Percept. mot. Skills*, 1962, 14(1), 155-165.—10 Os reproduced 10-element binary patterns flashed across fixation along the horizontal meridian. After the pattern was exposed, O was instructed to reproduce the pattern from left to right, right to left, center out, or to use any of the above 3 sequences at his option. Given an option, 9 of the 10 Os consistently marked the responses from left to right. Os made fewer errors on the left with left-to-right sequences than with right-to-left sequences. Marking responses from the center of the pattern, i.e., near fixation, out toward the ends of the pattern resulted in error-functions which were generally between those for right-to-left and left-to-right sequences.—W. H. Guertin.

2277. Banks, R., & Cappon, D. (U. Toronto) **Effect of reduced sensory input on time perception.** *Percept. mot. Skills*, 1962, 14(1), 74.—Data were gathered on time estimation (duration) and feeling about time passage after 90 minutes of reading or filling out questionnaires. The time was underestimated (7 of 8 Ss) but no clear relationship to the feelings about time passage emerged.—W. H. Guertin.

2278. Belyaeva-Eksemplarskaya, S. N. (Moscow, USSR) **Ob izuchenii protsessov vospriyatiya i otsenki vremeni.** [On the study of the process of perception and evaluation of time.] *Vop. Psikh.*, 1962, No. 1, 148-156.—The methodology and problems of research in time perception are discussed. A difficulty arising from the method of reproduction of time intervals is noted. Namely, if the reproduced time interval is too short or too long there is no way of telling how much of the error comes from the perception of the original time interval, and how much is introduced during the reproducing. The relation between judgments of elapsed time and the Ss activity during the time interval are discussed. The author distinguishes between cases where judgments of elapsed time are based on the events occurring during the time (perspective evaluation) and cases where judgments are based on the expectancy of the S during the time (expectancy or emotional evaluation). Judgments of time generally are related to what the S is considering when making his evaluation and on the individual tempo characteristics of the S.—H. Pick.

2279. Drever, J. (U. Edinburgh) **Perception and action.** *Bull. Brit. Psychol. Soc.*, 1961, 45, 1-9.—In his Presidential address to the British Psychological Society the author argues for an experimental study of perception based on the use of actions or operations as independent variables.—C. C. Kiernan.

2280. Farrow, Bobby J., & Santos, John F. (Menninger Found., England) **Changes in autokinetic perception as a function of the transfer of conditioning effects.** *Brit. J. Psychol.*, 1962, 53(3), 331-337.—This study was designed to test the hypothesis that the spatial region in which autokinetic movement occurs can be altered by means of negative reinforcement operations. 3 groups were employed. Control Group I was tested on autokinetic perception and after a 4 min. delay was retested. Control Group II viewed and reported the location of a moving light with no negative reinforcement between the test and retest of autokinetic perception. The Experimental Group received the same training as Control Group II, but was negatively reinforced while viewing and reporting the location of a moving light. A reinforcement schedule provided 75% of the reinforcements on the predominant side (left or right) of initial autokinetic movement and 25% of the reinforcements on the opposite side. The data supported the hypothesis that the spatial region of autokinetic movement can be altered by conditioning operations intervening between test and retest. An explanation of the results in terms of the conditioning of affect to the individual's subjective space is proposed and some implications of these effects for perception and behaviour are discussed.—Journal abstract.

2281. Levy, L. H. (Indiana U.) **Weber fraction analogues in social perception: Further investigation. A comment.** *Percept. mot. Skills*, 1962, 14(3), 424.—Braun and Haven recently reported results that they interpreted as not supporting the Weber Fraction Analogue in social perception. Levy takes issue with their interpretation.—W. H. Guertin.

2282. Mallick, Amar Kumar. **A scale for the measurement of subjective duration.** *J. psychol. Res., Madras*, 1962, 6(1), 1-3.—Analysis of data from psychological experiments on temporal estimate shows that the S's response is a linear function of the stimulus. A psychological scale was constructed both graphically and analytically from this line.—U. Pareek.

2283. Miller, Earl F., II, & Graybiel, Ashton. (USN School Aviation Medicine, Pensacola, Fla.) **Comparison of autokinetic movement perceived by normal persons and deaf subjects with bilateral labyrinthine defects.** *USN Sch. Aviat. Med. NASA Jt. res. Rep.*, 1962, Proj. MR005.13-6001, Subtask 1, Rep. No. 66; NASA Order No. R-37. ii, 10 p.—Autokinesis as perceived by 9 normals and 9 bilateral labyrinthine defective (LD) Ss was measured by a simple and highly reliable method. Each S participated in 2 trials (one sitting, the other recumbent), each of about 15 minutes duration. The results confirmed an earlier finding that the sensory organs of the inner ear are not essential for the perception of autokinetic movement. Furthermore, the amount of angular autokinetic movement was found to be significantly greater, on average, in the labyrinthine defective group than in the normal group of Ss. These findings suggest that the sensory input from the organs of the inner ear under the conditions of the

experiment tended either directly or indirectly to stabilize the fixation target in space. No significant differences in autokinesis were manifested between the 2 head (body) positions for either group.—*USN SAM & NASA*.

2284. Rosen, A. C. (U. California, Los Angeles) **A correlational exploration into perceptual and motivational phenomena.** *Percept. mot. Skills*, 1962, 14(1), 63-69.—Using stimuli of markedly differing structural character and emotional tone, a correlational analysis was performed on visual exposure duration thresholds obtained for 12 stimuli. Changes in perceptual thresholds appeared to be more powerfully influenced by the structural or formal characteristics of the stimuli than by the degree of the psychiatric patients' emotional distress. The findings suggest that caution must be exercised in interpreting or generalizing the findings of perceptual threshold experiments beyond the laboratories in which they were performed.—*W. H. Guertin*.

2285. Schneider, Carl W., & Bartley, S. Howard. (Michigan State U.) **A study of the effects of mechanically induced tension of the neck muscles on the perception of verticality.** *J. Psychol.*, 1962, 54(1), 245-248.—A connection between kinesthesia and visual perception was demonstrated. As tension in the neck muscles produced by a horizontal torque is increased, the perceived vertical of an upright rod tends to deviate farther from the true gravitational vertical on the side opposite the application of the torque. The initial rod position had a significant effect on the observer's perceived vertical. Hyperopia tends to result when torque becomes great, possibly accounting for the blurred vision experienced by many of the observers under the same conditions.—*Author abstract*.

2286. Siegman, A. W. (U. Maryland School Medicine) **Intercorrelation of some measures of time estimation.** *Percept. mot. Skills*, 1962, 14(3), 381-382.—The methods of verbal estimation, production, and reproduction were used to study subjective time with 5-20 sec. duration. Only the first 2 had satisfactory reliability. Correlations between verbal estimation and production and between verbal estimation and reproduction were significantly lower than the least reliable of the 2 methods being compared. It was suggested that these methods measure other variables in addition to subjective time units.—*W. H. Guertin*.

2287. Stone, Freda Beth. (Washington U.) **Retroactive effects in perception analogous to retroactive inhibition in learning.** *Dissert. Abstr.*, 1962, 22(12), 4419.—*Abstract*.

2288. Tánczos, Zsolt. (U. Budapest) **Szenzomotoros koordináció inverz látómezőben.** [Sensory-motor coordination in an inverse field of vision.] *Pszichol. Tanulmányok*, 1958, 1, 133-140.—"An 'analytical' version of the Stratton situation has been produced on the basis of connecting perception with motoric action in such a way that the action should influence the physical conditions of the perceptual quality in question." (Russian & English summaries)—*E. Friedman*.

2289. von Fieandt, K. (Stahlbergintie 3B, Braendoe, Helsinki, Finland) **Current trends in perceptual psychology.** *Psychol. Beir.*, 1962, 6(3-4), 651-661.—2 types of explanations: (a) S-R (stimulus-re-

action) and (b) S-O-R (stimulus-organism-reaction) prevail in the contemporary literature on perception. The historical background of both is discussed. Alternative reaction dispositions ("gestalt tendencies") are demonstrated with the aid of reversible patterns. The stimulus-oriented perceptual psychology of Gibson is mentioned, and an attempt is made to bring it in harmony with the organismic approach. (French & German summaries)—*H. J. Priester*.

2290. Zinchenko, V. P. (Inst. Psychology, RSFSR Acad. Pedag. Sciences) **Vospriatie i deistvie: Soobshchenie II. K kharakteristike protsessov vospriatiia.** [Perception and action. Communication II: Characteristics of the perceptual process.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1961, No. 5, 93-96.—Theoretical discussion of the process of perception in the light of Soviet psychology. The perception is broken down and analyzed in its different aspects such as practical-intentional, strictly perceptual, and reproductive.—*A. Cuk*.

Illusions

2291. Kaufman, Lloyd, & Rock, Irvin. **The moon illusion.** *Scient. American*, 1962, 207(1), 120-132.—2 theories have been advanced for the moon illusion: the apparent distance theory and the angle-of-regard theory. The authors demonstrate with a series of experiments that the moon illusion depends on the presence of terrain and specifically on the distance effect of the terrain. Eye elevation, color, and apparent brightness have nothing to do with the phenomenon.—*L. A. Wauck*.

2292. Kennett, J. R. (U. Houston) **Influence of subliminal stimuli on comparative judgments of length.** *Percept. mot. Skills*, 1962, 14(3), 383-389.—The effect of a synthesized, horizontal Mueller-Lyer figure was studied in 30 female Os with a figure in which the illusion-producing arrowheads differed one shade of gray from the background of the black figure. The experimental figure and a neutral control line were presented at (a) the mean light intensity for accurate verbal report, (b) one SD below the mean, and (c) two SD above the mean with a modified method of transposition. Os' judgments of line length were affected to a significant degree by the Mueller-Lyer figure at all 3 light intensity levels, but the effect was a reversal of the usual illusion. The greatest effect was at the subthreshold light intensity.—*W. H. Guertin*.

2293. Ponzo, Ezio. (U. Rome, Italy) **Contributo allo studio della reversibilità di prospettiva: Apprendimento a revertire e atteggiamento discriminativo.** [Contribution to the study of reversible perspective: learning to reverse and discriminative set.] *Riv. Psicol.*, 1961, 55, 33-55.—41 adult females in 2 matched groups observed 3 figures patterned on the Necker cube under instructions to get as many reversals as possible. Group I viewed figures in the order simple to complex (1, 3, and 6 cubes), Group II in the order complex to simple. Group I showed significantly more reversals, especially on the 6-cube figure. This is interpreted as evidence for learning. Both groups show substantial correlations between intelligence and frequency of reversal. Phenomenal reports are interpreted as evidence for the development of a response set favoring reversals.—*L. V. Steinzor*.

2294. Rock, Irvin, & Kaufman, Lloyd. The moon illusion. Part II. *Science*, 1962, 136 (Whole No. 3521), 1023-1031.—The moon's apparent size is a function of the presence or absence of terrain.—*Journal abstract*.

Aftereffects

2295. Cann, Michael Arthur. (Boston U.) The negative after-effect of motion as a function of test stimulus texture. *Dissert. Abstr.*, 1961, 22(3), 923.—*Abstract*.

2296. Holland, H. C. The spiral after-effect and extraversion. *Acta psychol., Amsterdam*, 1962, 20(1), 29-35.—Earlier studies revealed a shortening of the spiral-effect due to depressants, but no significant lengthening due to stimulants. Organics, who by hypothesis should behave like extreme extraverts, had aftereffect durations shorter than normals. The present report, dealing with 245 industrial apprentices, leads to a reappraisal of earlier results and a consideration of differences in experiments before results can be viewed as critical to the existing hypothesis.—*G. Rubin-Rabson*.

2297. Obonai, T. (Tokyo U. Education, Japan) Some analytical studies of the induction field. *Psychol. Beit.*, 1962, 6(3-4), 622-629.—Some quantitative studies of figural aftereffect and other related phenomena are presented. The field effect was found to decay exponentially. The inspection time of the stimulus figure and the duration of the aftereffect were connected by a power function. Increasing the size of the stimulus figure was also found to prolong the duration of aftereffect. A hypothetical general scheme of an induction field having an antagonistic dual nature was suggested in explanation of the experimental data. (French & German summaries)—*H. J. Priester*.

2298. Prentice, W. C. H. Aftereffects in perception. *Scient. American*, 1962, 206(1), 44-50.—Certain optical illusions involve the reversal of a geometrical figure on prolonged viewing. These aftereffects and similar ones appear to be due to a special electrical phenomenon in the brain.—*L. A. Waack*.

2299. Spigel, Irwin M. (Western Psychiatric Inst., U. Pittsburgh) Contour absence as a critical factor in the inhibition of the decay of a movement aftereffect. *J. Psychol.*, 1962, 54(1), 221-228.—In an experiment to determine the sufficient condition for the inhibition of aftereffect decay, 25 male Ss were employed in a 5 × 5 multiple latin square design. Intervals of darkness, relatively homogeneous illumination of different intensities, and successive exposure to contour and darkness were interpolated between objective movement stimulation and re-exposure to the stationary radial pattern. All interpolated post-movement stimulation, in which contour stimulation was minimized, brought about decay inhibition to a highly significant degree, as measured by residual aftereffect duration. Maximal inhibition was evident under conditions of interpolated darkness and illumination of reduced intensity. Conclusions were: (a) the rate of decay of a movement aftereffect may be inhibited by the interpolation of reduced contour stimulation, and (b) that change in stimulus condition is a factor in the mediation of the inhibitory process.—*Author abstract*.

2300. Spigel, Irwin M. (U. Pittsburgh School Medicine) Relation of movement aftereffect dura-

tion to interpolated darkness intervals. *Life Sci.*, 1962, No. 6, 239-242.—“The function relating residual aftereffect duration to multiples of S's mean aftereffect time in post-rotation darkness appeared to be linear. A least-squares fit yielded the equation: $T = 8.94 - 2.22M$, where T is the residual aftereffect in seconds, and M, the multiple of the normally determined mean aftereffect following exposure to the rotating pattern. Thus it may be inferred that the decay of the aftereffect is a linear function of multiples of the duration of one's mean aftereffect in post-exposure darkness.”—*C. T. Morgan*.

2301. Thurner, F. K., & Seyfried, H. Are figural after-effects dependent upon age? *Acta psychol., Amsterdam*, 1962, 20(1), 58-68.—Large individual differences, but no group differences, exist in figural aftereffects of perception among 12 year old children and adults. No sex differences appeared. The groups were compared for size of effect, slope of decline relative to time, frequency of occurrence of opposite effect, and goodness of fit of decrease in size to a logarithmic function of time.—*G. Rubin-Rabson*.

VISION

2302. Bykov, K. M., et al. (Eds.) *Trudy Chetvertogo Soveshchaniia po Fiziologicheskoi Optike*. [Transactions of the Fourth Conference on Physiological Optics.] *Probl. fiziol. Opt.*, 1958, 12, 1-550.—Papers, read at the Fourth Conference of Physiological Optics, held in October 1955 in Leningrad, are reproduced. The volume includes a resolution sketching future plans, pointing to serious deficiencies in optical research and practice, and suggesting measures for their elimination.—*I. D. London*.

2303. Davis, Preston, Jr. (Boston U.) Discrimination without awareness in a psychophysical task. *Dissert. Abstr.*, 1961, 22(3), 923.—*Abstract*.

2304. Evans, Leonard Albert. (U. Wisconsin) The effect of critical fusion frequency of monochromatic and heterochromatic stimulus alternation. *Dissert. Abstr.*, 1961, 22(3), 924.—*Abstract*.

2305. Jahoda, Gustav. (U. Glasgow) Refractive errors, intelligence and social mobility. *Brit. J. soc. clin. Psychol.*, 1962, 1(2), 96-106.—“Existing evidence concerning the relationship between refractive error and intelligence, and the determinants of the former, is reviewed. This leads to the expectation that myopia and hypermetropia entail some tendency towards upward and downward social mobility respectively. Two hypotheses were framed accordingly, and tested with samples of ametropic school-children and normal controls. The associations between type of refractive error, test performance and parental occupation were in conformity with the predicted patterns and highly significant. A tentative model is suggested which takes account of the time dimension in the mobility process, and the potential implications of the findings emerging from this exploratory investigation are discussed.”—*C. M. Franks*.

2306. Witte, W. (U. Tuebingen, Germany) Zur Wissenschaftsstruktur der psychologischen Optik. [The scientific structure of psychological optics.] *Psychol. Beit.*, 1962, 6(3-4), 451-462.—2 forms of statements in psychological optics may be distinguished besides the purely psychophysical ones: (a) those which include not the character of the stimuli but their identity, (b) those which are not related to

any stimuli and which deal with regular covariation of simultaneous phenomena data. Only the latter group of statements has intrinsic epistemological value and directs attention to the search for mediating physiological processes. (English & French summaries)—*H. J. Priester*.

Space Perception

2307. Boardman, W. K., & Goldstone, S. (Baylor U. Coll. Medicine) **Effects of subliminal anchors upon judgments of size.** *Percept. mot. Skills*, 1962, 14(3), 475-482.—A 4-field tachistoscope was used to present a series of 5 disks by the method of single stimuli. Os made judgments of magnitude on a 5-point scale. An extra-series anchor was then presented subliminally prior to the exposure of each judged stimulus. For one group of Os subliminal anchor above the stimulus series was used, for the other an anchor below the stimulus series. Each produced a significant shift in judgments in the same direction as do equivalent supraliminal anchors. The results suggest that classical sensory thresholds do not represent the lower limit of quantifiable stimulus effects upon judgments.—*W. H. Guertin*.

2308. Brown, D. R., Hitchcock, L., Jr., & Michels, K. M. (Purdue U.) **Quantitative studies in form perception: An evaluation of the role of selected stimulus parameters in the visual discrimination performance of human subjects.** *Percept. mot. Skills*, 1962, 14(3), 519-529.—20 undergraduate students were tested on 80 6-choice oddity problems. The problems were constructed so that intraproblem figures (random metric figures) were equated on sidedness plus axial rotation, elongation, compactness, or areal asymmetry. A curvilinear relationship was obtained between correct discrimination time and sidedness (complexity), with 4-sided figures being most difficult to discriminate. Equating figures on axial rotation led to consistent difficult discrimination, but the relative importance of other dimensions to discriminability varied for different levels of complexity.—*W. H. Guertin*.

2309. Calvin, A. D., & Youniss, J. (Behavioral Research Lab., Palo Alto, Calif.) **The enclosing contour effect: Some additional remarks.** *Percept. mot. Skills*, 1962, 14(1), 132.—The authors briefly discuss parallels in the results of an earlier study on the enclosing contour effect that was called to their attention.—*W. H. Guertin*.

2310. Cohen, R. L. (U. Uppsala, Sweden) **An investigation of velocity synthesis.** *Scand. J. Psychol.*, 1962, 3(2), 97-111.—A short series of experiments has shown that it is possible to divide up the distribution of scores obtained from a group of Ss performing on the velocity synthesis apparatus mainly on the basis of (a) instructions and (b) eye behavior. It was further found that the difference in scores dependent on differences in eye behavior could be traced to the effect of the Aubert-Fleischl Paradox. An alternative to the gestalt model was suggested, viz., a signal/interference model.—*Journal abstract*.

2311. Ganem, George P. **Absolute judgments of velocity.** *USAF ESD tech. docum. Rep.*, 1962, No. 62-37. iii, 13 p.—The present study was conducted to determine the maximum amount of information transmitted by Os in the absolute judgment of velocity. The study was subdivided into a series of 5 experi-

ments in which 2, 4, 7, 10, or 19 sweep velocities of a 4½-inch cathode ray tube—ranging from .70 inches per second to 300 inches per second (3.90° per second to 1688.70° per second of visual angle)—were presented to 4 Ss who were required to identify the stimuli with numbers ranging from 1 to 19. An information analysis indicated that as the amount of stimulus information was increased the amount of transmitted information also increased, but at a decreasing rate, until a maximum of 2.23 bits of information was transmitted. Although anchoring effects occurred at both ends of the stimulus continuum, the low velocities were more accurately identified than were the high velocities.—*USAF ESD*.

2312. Gottsdanker, Robert. (U. California, Santa Barbara) **Assessment of motion as influenced by structure of background.** *Scand. J. Psychol.*, 1962, 3(2), 122-128.—Detection of target acceleration was improved by having a near landmark in addition to the surrounding frame. Adding landmarks, even within the course of motion, brought no further gain. Evidently, rate is not assessed by estimating time taken to cover known distances. Best performance was found when fine background marks were near enough together to form a texture, but not if it was perfectly uniform. It is suggested that the advantage provided both by the near point and the texture is the indirect one of stabilizing space. This effect is conceived of as graded, reaching its ultimate value in a textured surface.—*Journal abstract*.

2313. Harker, G. S. (USA Medical Research, Ft. Knox, Ky.) **Apparent frontoparallel plane, stereoscopic correspondence, and induced cyclotorsion of the eyes.** *Percept. mot. Skills*, 1962, 14(1), 75-87.—The presence of perceptual factors other than stereopsis to determine the apparent frontoparallel plane in the stereoscopic measurement of induced cyclotorsion of the eyes was demonstrated. The significance of the explanation offered for these data and those of "binocular depth contrast" lies in the possibility of applying the explanatory mechanism of the line-of-sight-dependency of stereopsis and the equidistance tendency to complex perceptual situations other than those from which they were derived.—*W. H. Guertin*.

2314. Johansson, G. (Uppsala U., Sweden) **Perceptual overestimation of small motion tracks.** *Psychol. Beitr.*, 1962, 6(3-4), 570-580.—The effect of overestimation of small motion tracks in visual perception has been established and termed Motion Track Enlargement (MTE). Experiments indicate that there are marked individual differences in the degree of MTE. Each of 47 Ss, however, recorded consistent overestimation. Every motion stimulation was accompanied by a large measure of MTE. (French & German summaries)—*H. J. Priester*.

2315. Kohler, Ivo. **Experiments with goggles.** *Scient. American*, 1962, 206(5), 62-86.—Special lenses are used to demonstrate the eye's remarkable ability to correct for distortions. Such studies help to explain how the visual system learns to produce an effective picture of the world.—*L. A. Wauck*.

2316. Krauskopf, John. (Rutgers U.) **Light distribution in human retinal images.** *J. Opt. Soc. Amer.*, 1962, 52(9), 1046-1050.—The image-forming properties of the human optical system have been examined with the aid of a photoelectric ophthalmoscope. The light distributions in images of bright vertical

lines formed by a double passage through the eye optics were measured. On the assumption that the eye optics are reversible, the light distributions on the retina were computed by means of Fourier transforms. The results are also expressed in terms of the spatial frequency response functions for the eye. The effects of pupil size were examined. The best imagery was obtained with a 5-mm. pupil. The results confirmed the earlier measurements on human eyes reported by Flamant. The more recent experiments on animal material by DeMott do not seem to be relevant to living human eyes.—*Journal abstract.*

2317. Metzger, W. (U. Münster, Germany) *Ergänzende Beobachtungen über Gestaltfaktoren für Bewegungsverläufe.* [Complementary observations on gestalt factors in tracks of movements.] *Psychol. Beih.*, 1962, 6(3-4), 607-619.—Some open questions of phenomenal identity are discussed with the aid of new trick films. The principal results are that (a) closure does not play an essential part in the distribution of tracks of movements, (b) this distribution of tracks of movements differs in several respects from the arrangement of configurations as seen simultaneously by adults. (English & French summaries)—*H. J. Priester.*

2318. Monty, R. A., & Boynton, R. M. (General Electric Missile & Space Vehicle Dept.) *Stimulus overlap and form similarity under suprathreshold conditions.* *Percept. mot. Skills*, 1962, 14(3), 487-498.—When 2 forms having equal area are superposed, the amount of common area will vary from just above zero % when the 2 forms are just touching to some maximum value, as a function of the translational and rotational positions of the forms. The term "overlap" refers to the maximum value that can be obtained either by translation or by translation and rotation of the forms. Thus, TR overlap is the maximum overlap that can be obtained by translational and rotational movement of the forms whereas T overlap is the maximum overlap that can be obtained by translation alone. The experiment demonstrated that the overlap between forms in a pair serves as a predictor of the extent to which the forms will be judged as similar.—*W. H. Guertin.*

2319. Nazzaro, James Russell. (Columbia U.) *Bisection of a visual spatial interval.* *Dissert. Abstr.*, 1961, 22(4), 1266.—*Abstract.*

2320. Over, Ray. (Queen's U.) *Stimulus wavelength variation and size and distance judgments.* *Brit. J. Psychol.*, 1962, 53(2), 141-147.—Previous experiments which have studied the relationship between stimulus wavelength variation and size and distance judgments have confounded wavelength with luminance, which is known to be an effective variable. Using a rationale which combines the fact that light from stimuli of different wavelengths stimulates different areas of the retina (chromatic aberration) with the finding that under reduced viewing conditions 2 stimuli of the same wavelength are judged equal in both size and distance when they stimulate equal areas of the retina, it was predicted that when the S was presented with 2 stimuli subtending the same visual angle and of the same luminance but of different wavelengths the stimulus of longer wavelength would be judged to be both larger and closer than the stimulus of shorter wavelength. This prediction was confirmed in the experiment.—*Journal abstract.*

2321. Pearce, D. G., & Taylor, M. M. (Defence Research Medical Lab., Toronto) *Visual length as a function of orientation at four retinal positions.* *Percept. mot. Skills*, 1962, 14(3), 431-438.—Intervals flash-presented at various orientations and positions with their centres always 10° from the fixation point, were compared with a 3.6° horizontal standard interval with its centre at the fixation point. Fixation was accomplished with a "disappearing spot" technique. The results have been interpreted as showing that the usual horizontal-vertical illusion does not operate alone in the near periphery. A tentative conclusion has been drawn that distances radial to a particular point 6.5° from the fixation point are underestimated relative to distances tangential to a circle with its centre at that point. The ordinary horizontal-vertical illusion may be regarded as an example of the same general effect.—*W. H. Guertin.*

2322. Rausch, E. (U. Frankfurt, Germany) *Über optisch wahrgenommene Singularitätsverlagerungen.* [Visually perceived dislocations of singularities.] *Psychol. Beih.*, 1962, 6(3-4), 581-597.—The dislocation of a dark singularity in a motionless configuration of points of light is described. The comparison with nonrealized variants is used as the special method in discussing this phenomenon. The singularity dislocation described is placed theoretically between stroboscopic dark-Phi and pure succession and is referred to as successive-Phi. (English & French summaries)—*H. J. Priester.*

2323. Smith, B. B. (Oxford U.) *Neighborhood phenomena.* *Jb. Psychol. Psychother. med. Anthropol.*, 1960, 7(3-4), 287-311.—The concept of "blisters" of du Mas and its experimental foundations are discussed, and a new concept of "neighborhood phenomena" proposed. According to the author these perceptual processes suggest a central operation. "Perceptually, whenever and wherever objects approach one another and interpose themselves, something happens: there is some departure from the rigid demands of a simple pinhole geometry. Objects as they slip out of sight, merge with or pass one another, or are seen out of the tail of the eye, continually deform or shift, only to recover themselves and their immobility when they are in the open and subject to direct scrutiny."—*V. J. Bieliuskas.*

2324. Wallach, H., & Lindauer, J. (Swarthmore Coll.) *On the definition of retinal disparity.* *Psychol. Beih.*, 1962, 6(3-4), 521-530.—It is proposed that retinal disparity is effective through the differences in the configuration of the 2 monocular patterns, as such, rather than through differences in location on the retinae of individual points and lines. 4 experiments are reported in support of this thesis, and they show that the effectiveness of retinal disparity varies with the conspicuousness of the difference in configuration which the disparity produces. (French & German summaries)—*H. J. Priester.*

2325. Westheimer, Gerald, & Campbell, Fergus, W. (U. California, Berkeley) *Light distribution in the image formed by the living human eye.* *J. Opt. Soc. Amer.*, 1962, 52(9), 1040-1045.—By photoelectric scanning, the light distribution was determined in the aerial ophthalmoscopic image of a thin light filament viewed by an observer with an homotropized eye. Light distributions were obtained for various pupil sizes and degrees of defocusing. Measurements were also obtained with bar and grat-

ing objects. To compute the line-spread function on the fundus, correction was made for the double passage of the light through the optical system of the eye on the assumption that the spread in angular measure is the same in both directions. The results may be considered to depict distributions which are possibly broader, but certainly not narrower, than the real distributions in the retinal image. The line-spread function on the fundus was determined to have a $\frac{1}{2}$ -width at $\frac{1}{2}$ -height of 1 minute of arc for an eye in best focus with a 3-mm. pupil, and this suggests that the point-spread function has $\frac{1}{2}$ -width 0.66 min. of arc as an upper estimate.—*Journal abstract.*

2326. Zajac, J. L. (U. Edinburgh, Scotland) **Some investigations of perception of movement and related depth phenomena.** *Brit. J. Psychol.*, 1962, 53(2), 117-128.—Investigations of perception of real movement have been carried out using a special apparatus designed by the author. Movement of a pendular character was produced by placing a prismatic "Chance Crookes" glass in front of one eye of an observer looking through it at a vertical rod, and rotating the glass. Amplitude and direction of the movement were a function of the distance of both the glass and the rod from the eye, of the thickness and prismatic angle of the glass, and of the direction and angle of turn of glass in relation to the eye. When angle of turn or speed of rotation, or both, are gradually increased, other factors remaining constant, observations concerning movement, in both monocular and binocular vision, varied following fixed sequences for monocular and binocular vision. The experiments consisted in noting the kind of observation and recording the related angle of turn and number of rotations of the prismatic glass; from these data mean speeds of the movement of the image of the rod were calculated. Observations concerning depth phenomena accompanying various kinds of perceived movement were also made.—*Journal abstract.*

2327. Zajac, J. L. (1917 Sanderson Dr., Ottawa Canada) **Stereoscopic depth phenomena with Witte-König effect.** *J. Psychol.*, 1962, 54(1), 153-157.—When 2 short lines separated by a sufficiently small gap, placed in front of one eye and only one in front of the other, are fused stereoscopically, a permanent gap appears in the composite image; but it is alternately closed and uncovered, or permanently closed, when the gap is increased. This so-called Witte-König effect was observed independently also by Zajac who made investigations on accompanying depth phenomena in the 3 mentioned situations. Reliefs, some quite unexpected, varied with changing relative lengths of particular lines and with changing size of the gap and also depended on whether the gap was closed or uncovered.—*Author abstract.*

2328. Zaporozhets, A. V. (Inst. Preschool Education, RSFSR Acad. Pedagogical Sciences) **O deistvennom kharaktere zritel'nogo vospriiatia predmeta.** [Effectiveness of visual perception of objects.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1962, No. 1, 77-80.—Survey and discussion of experimental data from the author's laboratory on orienting activity in visual perception. The author concludes that "the process of visual perception is an abbreviation of the orienting activity."—*A. Cuk.*

2329. Zusne, L., & Michels, K. M. (Purdue U.) **Geometricity of visual form.** *Percept. mot. Skills*, 1962, 14(1), 147-154.—2 experiments were performed

to investigate the concept of geometricity by using some of the quantifiable physical shape parameters recently developed by others. A sample of 55 4-sided polygons was constructed by systematically distorting the square. Measurements were taken of their compactness, elongation, and areal symmetry in 3 axial rotations and combined into indices of measured geometricity. A total of 342 Ss were asked to rate the shapes, on a point scale, on their geometricity, regularity, and familiarity. Findings indicated important interactions between the rating variables and shape characteristics.—*W. H. Guerin.*

Color Vision

2330. Kelly, D. H. (Itek Lab., Lexington, Mass.) **Visual responses to time-dependent stimuli: IV. Effects of chromatic adaptation.** *J. Opt. Soc. Amer.*, 1962, 52(8), 940-947.—At photopic levels, the amplitude-frequency response curve of the retina assumes a wide variety of shapes when the color of the flickering component of the stimulus is not the same as that of the steady component. Apparently, the photoreaction rates and neural time constants of the various color subchannels differ in the same order as their spectral sensitivities, so that low-frequency sensitivity is enhanced when the adapting wavelength is longer than the flickering wavelength, and high-frequency sensitivity is enhanced when the adapting wavelength is shorter than the flickering wavelength. Chromatically adapted responses to white flicker show that the low-frequency band (4-7 cps) is controlled by the blue-sensitive channel; the middle-frequency band (10-15 cps), by the green-sensitive channel; and the high-frequency band (20-30 cps), by the red-sensitive channel. The results also depend on the spatial pattern of the stimulus; a sharp-edged field obscures the "red" peak and enhances the "blue" peak, even in the absence of blue light. These phenomena cannot be detected with traditional flicker-fusion stimuli, since they do not occur at the CFF.—*Journal abstract.*

2331. Siegel, Michael H. (USN Medical Research Lab., Groton, Conn.) **Discrimination of color: I. Comparison of three psychophysical methods.** *J. Opt. Soc. Amer.*, 1962, 52(9), 1067-1070.—The comparative adequacy of the method of limits, the method of constant stimulus differences, and the method of adjustment was studied by using 3 criteria suggested by Blackwell. It was concluded that the method of constant stimulus differences was the most adequate and the method of adjustment the least adequate for determining sensitivity to color differences.—*Journal abstract.*

2332. Siegel, Michael H., & Dimmick, Forrest L. (USN Medical Research Lab., Groton, Conn.) **Discrimination of color: II. Sensitivity as a function of spectral wavelength, 510 to 630 m μ .** *J. Opt. Soc. Amer.*, 1962, 52(9), 1071-1074.—The study reports the experimental determination of just noticeable differences in color as dependent upon wavelength at 10-m μ steps from 510 to 630 m μ . The method of constant-stimulus differences was used to produce limens in terms of measures both of central tendency and of dispersion of judgments. The data have been analyzed to determine the different functional relationship between various colors and wavelengths. Peak sensitivity was found in the yellow

region of the spectrum. The results were discussed in terms of methodological differences between the present and earlier studies and were applied to psychologically unique colors.—*Journal abstract.*

2333. Wheeler, Lawrence. (Indiana U.) **Color-naming responses to red light of varying luminance and purity.** *J. Opt. Soc. Amer.*, 1962, 52(9), 1058-1066.—A 10 × 10 Greco-Latin square composed of 2 10-value sets of neutral density filters projected with red and tungsten lights provided a combination image in which the arrangement of hues appeared unsystematic. 9 Ss gave a total of 1326 color-naming responses from which were derived estimates of hue, lightness, and saturation for each cell of the square. Saturation varied as a function of the purity of the red light, lightness was found to be associated mainly with relative luminance, and hue was related both to proportion of red light and to relative luminance. Hue ranged over nearly the entire circuit, while lightness and saturation varied over considerable ranges. Analysis by concentric layers or rings of the sampling space described the response-events clearly, while analysis by constant chromaticity lines through the sampling space showed that single hues did not lie along such lines.—*Journal abstract.*

Visual Sensitivity

2334. Braunstein, Myron L., & White, William J. (Cornell Aeronautical Lab., Buffalo, N. Y.) **Effects of acceleration on brightness discrimination.** *J. Opt. Soc. Amer.*, 1962, 52(8), 931-933.—Brightness discrimination thresholds were determined at positive acceleration levels of 1, 2, 3, and 5 g and transverse acceleration levels of 1, 2, 3, 5, and 7 g. 4 background luminance-levels, ranging from 0.03 to 31 ft-L, were studied. Contrast required to detect an increment in illumination increased with acceleration. This increase was present for both directions of acceleration and for all background levels, but was most marked for positive acceleration and for the dimmest background. At 0.03 ft-L, 16% contrast was required to detect a target at 5 g positive, as compared to 9% at 1 g.—*Journal abstract.*

2335. Brown, John Lott. (U. Pennsylvania) **Harmonic analysis of visual stimuli below fusion frequency.** *Science*, 1962, 137(Whole No. 3531), 686-688.—Data which represent the relation between modulation amplitude and frequency of a sinusoidally modulated light stimulus for constant flicker appearance have been employed to predict characteristics of rectangular waveforms which will be of the same flicker appearance. Predictions are compared with the results of an experiment in which such rectangular waveforms were employed.—*Journal abstract.*

2336. Dixon, Norman F. **Feedback and the visual threshold.** *J. Commun.*, 1962, 12(2), 97-105.—A test of the hypothesis that "threshold changes in a situation allowing perceptual defense but not voluntary suppression were central in origin" was made using a schizophrenic experimental and a normal control group. Ss moved a lever to adjust the brightness of a light spot while subliminal stimuli (emotional and neutral words) were presented visually. The results showed significant differences between the groups and suggest the possibility of there being 2 quite separate mechanisms for the regulation of perceptual thresholds: one using a neural feedback

system normally outside of voluntary control, the other using a feedback device normally under full voluntary control.—*D. E. Meister.*

2337. Erdmann, Robert L. (IBM Corp., San Jose, Calif.) **Brightness discriminations with constant duration intermittent flashes.** *J. exp. Psychol.*, 1962, 63(4), 353-360.—The probability of detection of constant duration intermittent flashes was studied as a function of flash frequency with flash luminance and background luminance as parameters. "The increase in the number of chances for flash detection with increasing flash frequency may account for the initial increase in probability of detection that occurs for all luminance values. The decreases in detection probability for the higher flash frequencies at the higher background luminance levels can possibly be attributed to a period of diminished sensitivity that is dependent upon the time interval between flashes. The failure to observe this effect at the lowest background luminance can possibly be attributed to a difference in critical duration."—*J. Arbib.*

2338. IArbus, A. L. (Inst. Biological Physics, Moscow, USSR) **Vospriatie izobrazhenii, nepodviznykh otnositel'no setchatki i izmeniaushchikhsia po tsvetu.** [The perception of images, motionless with respect to the retina and changing in color.] *Biofizika*, 1962, 7(3), 333-335.—Utilizing 4 Ss, it is shown that any suprathreshold increase of light, falling on an "empty field," does not reveal the characteristics of the test-field and is perceived only as an increase in light. However, any suprathreshold decrease of such light discloses the characteristics of the test-field, but the color discerned is distorted. While the threshold of perceived changes of color depends on the background, this dependence is preserved even when the background is not perceived due to immobility with respect to the retina.—*I. D. London.*

2339. Luria, S. M., & Sperling, H. G. (Honeywell Research Cent., Hopkins, Minn.) **Phase relations in flicker fusion.** *J. Opt. Soc. Amer.*, 1962, 52(9), 1051-1057.—The luminance at which the flicker of a white test light was perceived was determined as a function of the phase angle between the light and pulsing white, green, yellow, red, and blue surround fields which were equated for brightness. It was found that the luminance thresholds for perceived flicker increased when the test light and the surround were in phase. The amount of increase varied as a function of the color of the surround, being a maximum for white, less for green, still less for yellow, and a minimum for red and blue. No difference in absolute threshold were found as a function of phase for 1-sec. observation periods of the test flash. The results are discussed with reference to the differences in amplitude as a function of the surround wavelength as well as to submaxima found in the luminance functions.—*Journal abstract.*

2340. Marimont, Rosalind B. (National Inst. Mental Health, Bethesda, Md.) **Model for visual response to contrast.** *J. Opt. Soc. Amer.*, 1962, 52(7), 800-806.—A simple steady-state model is proposed to explain a well-known phenomenon of subjective brightness, namely that high illuminance greatly increases the apparent contrast of a scene. This effect is obtained in the model by making both the reference level and gain of the system depend on

the average illumination. The numerical values of the system parameters evaluated from published data of Hurvich and Jameson are in good agreement with those derived from independent experiments of S. S. Stevens. The basic model can be improved by modifications which make it show qualitatively the stabilized retinal image effect, and edge effects such as Mach bands. The physiological plausibility of the model is discussed briefly and no implausible requirements are found.—*Journal abstract.*

2341. Mikhalevskaia, M. B. (Moscow State U., USSR) O vozmozhnosti ispol'zovaniia nekotorykh svoistv kozhno-gal'vanicheskogo refleksa pri opredelenii poroga. [Possible use of some features of the GSR in threshold determination.] *Dokl. Akad. Pedagog. Nauk RSFSR*, 1962, No. 1, 109-112.—EEG and GSR of 40 Ss were recorded while the Ss were tested for visual threshold by the method of minimal changes. 3 aspects of the GSR were used as threshold indicators—RT, duration, and amplitude. RT was found to be the best indicator of the stimulus intensity.—*A. Cuk.*

2342. Ogle, Kenneth N. (Mayo Clinic & Mayo Found., Rochester, Minn.) Blurring of retinal image and foveal contrast thresholds of separated point light sources. *J. Opt. Soc. Amer.*, 1962, 52 (9), 1035-1039.—Foveal contrast thresholds of the light-adapted eye were measured for 2 point light sources, whose separation could be varied, and for different degrees of out-of-focus imagery. The data for sharp imagery were similar to those obtained by Van den Brink for the dark-adapted eye. It appears that for separations of the point sources from zero to about 3 min. of arc the contrast threshold increases linearly. Approximately 3 min. of arc (depending upon pupil diameter) is a critical angle of separation, because for greater separation the threshold remains constant. This is interpreted to indicate no overlapping of blur disks, no integration of luminous energy, and no inhibition of the 2 images for separations greater than this critical angle. Blurring of the images of the points increased the critical angle only slightly. This implies that the distribution of illumination within the blurred image cannot be predicted from geometrical considerations.—*Journal abstract.*

2343. Onley, Judith Wheeler, & Boynton, Robert M. (U. Rochester) Visual responses to equally bright stimuli of unequal luminance. *J. Opt. Soc. Amer.*, 1962, 52(8), 934-940.—Conditioning stimuli of differing luminances, which appear equally bright because of the effects of previous light adaptation, may produce essentially equivalent on-responses, as evaluated by the temporal changes in the threshold of a superimposed test flash. The magnitude of these responses is directly related not to the actual luminance of the conditioning stimulus in each case, but to its brightness. Over a fairly wide range of conditions of light adaptation and brightness, constant brightness is accompanied by constant changes in log visual sensitivity, as assessed both by an increment threshold and the conditioning-stimulus-test-flash-threshold techniques. Only at intermediate sensitivity levels is there any evidence for a simple "filter factor" model for the light-adaptation mechanism. The visual response at the extremes of the sensitivity range appears to approach physiological limits which render a simple model of the effects of light adaptation untenable.—*Journal abstract.*

2344. Stary, D. (Centar za Profesionalnu Orijentaciju Omladine, Zagreb) Utjecaj različitog intenziteta treptavog svijetla na naknadnu frekvenciju fuzije. [Effect of flickering light of different intensity on critical fusion frequency.] *Arh. Hig. rada*, 1960, 11, 1-7.—The stimulation of the eye by subfusional flickering of light reduces CFF 4 Ss were stimulated for 30 sec. with different subfusional frequencies of light intensity of 12 nits, and greatest reduction of cff was found with the stimulating frequency of 15 per sec. Performing the same experiment, but with 50 nits, Bujas obtained the greatest reduction with stimulating frequency of 20 per sec. This leads to a hypothesis that the experience of flickering light with the frequency of 15 per sec. and the intensity of 12 nits is subjectively equal to that of 20 per sec. and of 50 nits. This difference seems to depend on the intensity of light. CFF depends on the functional state of the centers disregarding various peripheral processes which cause it.—*B. Petz.*

2345. Taylor, Nelson W. (Minnesota Mining & Manufacturing Co., St. Paul) Foveal vision: Dependence of threshold energy on the visual angle of a circular target. *J. Opt. Soc. Amer.*, 1962, 52 (7), 820-825.—It is shown that circular nonmoving targets detected at threshold, which appear as a "point source" for low values of the subtended visual angle (target diameter), pass smoothly into a subjective annular shape for larger diameters. The annulus is the locale of the luminance gradient and therefore provides the significant visual information. The annulus width is 0.9 min. of arc when the adapting luminance B is 10^2 ft-L and rises to 1.3 min. as B falls to 10^{-8} ft-L. Because of this continuous transition from a point source to an annulus, the "critical visual angle" is at best only an approximation. Over a range of B from 10^{-8} to 10^2 ft-L and a duration of stimulus from 10^{-2} to 1 sec. the threshold energy for a point source rises 140 fold. The corresponding rise in the threshold energy per square min. of annulus area is about 1600 fold. The trends in threshold energy and in threshold contrast with increasing target size are believed to measure some of the effects of retinal (or neural) interaction and inhibition in the human fovea.—*Journal abstract.*

2346. Wolf, Ernst, & Morandi, Anthony J. (Massachusetts Eye & Ear Infirmary, Boston) Retinal sensitivity in the region of the blind spot. *J. Opt. Soc. Amer.*, 1962, 52(7), 806-812.—Threshold sensitivity was studied in 2 observers along lines running vertically and horizontally through the region of the optic disk. When the test field fell entirely on the disk the luminance of test flashes of 0.04-sec. duration could be raised to a level high enough to cause an excitation. Under these conditions the luminance may be 1-2 log units higher than that required for excitation of retinal regions adjacent to the disk. It is assumed that the excitation was brought about by scatter of light in the ocular media. This assumption was supported by the fact that (a) differences in sensitivity were found between the 2 observers due to changes in transmittance of the dioptric media with age, and (b) that when test fields of various sizes (1° , 2° , 5° , and 10°) were projected into the disk area and dark adaptation was studied, bipartite dark-adaptation curves were obtained which indicated the participation of rods and cones. The size of the disk area as determined by excitability measurements cor-

responds to that found in tangent screen tests. The nasal edge of the disk is more precisely defined than the temporal edge, a fact which is accounted for by the relatively greater sensitivity of the retinal elements in the nasal area.—*Journal abstract.*

2347. Yonemura, Gary Toshi. (Columbia U.) Luminance threshold as a function of angular distance from an inducing source. *Dissert. Abstr.*, 1961, 22(4), 1267.—*Abstract.*

2348. Yonemura, Gary T. (Columbia U.) Luminance threshold as a function of angular distance from an inducing source. *J. Opt. Soc. Amer.*, 1962, 52(9), 1030-1034.—This experiment is concerned with the distance at which a light spot disappears from the edge of a large inducing source. Considerations relative to luminance discrimination are introduced, and it is demonstrated that the results of the present experiment are describable as having some of the formal characteristics of that type of discrimination. It was observed that the border of the inducing field appeared to shift with luminance changes of the test spot. As a first approximation the results of this experiment could be accounted for by a stray-light hypothesis.—*Journal abstract.*

Eye Movements

2349. Gardner, Riley W., & Long, Robert I. (Menninger Found.) Control, defence and centration effect: A study of scanning behaviour. *Brit. J. Psychol.*, 1962, 53(2), 129-140.—"In the present study, electrooculography was employed to obtain precise measures of the scanning strategies 60 subjects employed in four size estimation tests. In addition to providing evidence of consistent individual scanning syndromes, the study showed that extensiveness of scanning is a determinant of apparent size in the relatively difficult size estimation test in question. The study also confirmed Piaget's hypothesis (see Piaget, 1961) that the apparent size of a stimulus is a function of the duration of a single centration upon it. Subjects were shown to be consistently different from each other in these centration effects, independent of the significant negative correlation of the effect with age. These individual differences were significantly associated with the apparent size of standard stimuli in a relatively simple size estimation test."—C. T. Morgan.

2350. Luria, R. A., & Homskaya, E. D. (Moscow U.) An objective study of ocular movements and their control. *Psychol. Beitr.*, 1962, 6(3-4), 598-606.—A photoelectric registration of ocular movements in different forms of control showed that ocular movements regulated by verbal instruction and without visual afferentation had in all cases a saccadic character, whereas ocular movements tracing an oscillating luminous spot were smooth and isomorphic to the path of the moving object. When the velocity of these oscillations increased the structure of ocular movements changed and they turned into saccadic movements. A study of patients with local lesions of the brain showed that a lesion of the anterior oculomotor zones results in a deterioration of "voluntary" eye movements with a persistence of visually afferented tracing movements, whereas a lesion of posterior oculomotor zones had an opposite effect. (French & German summaries)—H. J. Priester.

2351. Stockbridge, H. C. W. (War Office, Great Britain) Winking: A note. *Percept. mot. Skills*,

1962, 14(3), 380.—In connection with a sighting problem, it became necessary to know how many people could produce a wink, or willed monocular blink, with either eye. A set of 3 slides was prepared for a stereoscopic viewer, that required winking for a solution to a task. It was concluded that 3% of Ss would not be able to close either eye at will.—W. H. Guertin.

CHEMICAL SENSES

SOMESTHESIS

2352. Egorov, A. S., & Zakhariants, Iu. Z. (Inst. Physical Culture, Leningrad, USSR) Élektrofiziologicheskoe issledovanie kinestezicheskogo analizatora: Soobshchenie II. Vremennye komponenty dvizheniya. [Electrophysiological research of the kinesthetic analyzer: Communication II. Temporal components of movement.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1962, No. 1, 113-116.—The EMG of 6 Ss was recorded while Ss were moving their arm in the up and down direction. The duration of movement was under study. Movement was performed under different conditions (passive and active, controlled and uncontrolled movement). The main result was that "the kinesthetic analysis of the duration of movement takes place on the basis of interruptions in the uninterrupted stream of muscular stimulations corresponding to the limits of the temporal intervals that we are looking for."—A. Cuk.

2353. Ellis, H. C., & Bessemer, D. W. (U. New Mexico) Associative scaling of random tactual stimuli. *Percept. mot. Skills*, 1962, 14(1), 89-90.—3 measures of association values for 8 random tactual shapes were determined using a modification of Noble's (1952) method. The obtained tactual values appeared comparable to reported association values for equivalent visual shapes. Correlations among the 3 measures suggested: (a) an increase in the average latency of responses associated with a stimulus as the total number of such associates increases, and (b) the rank-ordering of stimuli by the common methods of associative scaling may depend to some extent on the duration of the association period.—W. H. Guertin.

2354. Green, Robert T. (University Coll. London, England) The absolute threshold of electric shock. *Brit. J. Psychol.*, 1962, 53(2), 107-115.—"Thresholds for electric shock were obtained under twelve conditions. Three types of stimulus were used; constant voltage, constant current, and constant power. These, combined with three sizes of electrode, gave nine conditions in all. A further three thresholds were obtained using the three types of stimulus and the medium size electrodes, with the addition of electrode jelly to improve contact. The results indicated that power is the relevant variable, and that sensitivity to threshold shocks probably depends on the amount of power dissipated in the immediate vicinity of the skin receptors. . . . The influence of ambient temperature and humidity were found to be inoperative within the limits investigated. . . . [There] would appear to be sound arguments for using a constant wattage a.c. stimulus to counteract the variations in the impedance of a biological circuit."—C. T. Morgan.

2355. Gonda, T. A. (Stanford U.) Some remarks on pain. *Bull. Brit. Psychol. Soc.*, 1962, 47, 29-35.—A distinction between pain at a personal or subjective level, and pain at an interpersonal or "pain behavior" level is drawn. The state of research on pain

in light of this distinction is briefly reviewed, and a study on the interpersonal level suggesting a relation between pain complaint, family size, and age ($p < .001$) is reported.—C. C. Kiernan.

2356. Riisager, P. M. (United Oxford Hosp., Oxford, England) A clinical study of the numerical variation with age of compact nerve endings in the human conjunctiva. *J. Neurol. Neurosurg. Psychiat.*, 1962, 25(2), 134-136.—"A technique for the staining of conjunctival nerve fibres at the bed side is described. The number of compact nerve endings occurring in the eyes of three subjects, who had no clinical involvement of the trigeminal nerves, was estimated. These endings are probably caused by degenerative and/or regenerative changes. Half the endings in the scleral conjunctiva of each eye were found in the supero-lateral quadrant, and the fewest endings in the infero-medial quadrant. This variation is probably related to the exposure of the sclera to the atmosphere. The number of compact endings increases directly with age."—M. L. Simmel.

2357. von Békésy, Georg. (Harvard U.) Can we feel the nervous discharges of the end organs during vibratory stimulation of the skin? *J. Acoust. Soc. Amer.*, 1962, 34(6), 850-856.—"The vibratory pitch sensation is a complicated function of both the frequency and the amplitude of the vibrations, and frequency discrimination on the skin is thus inaccurate within a range of one or two octaves. Rutherford's telephone theory for pitch discrimination does not describe the pitch of vibratory sensations."—A. M. Small, Jr.

2358. Weinstein, S. (Albert Einstein Coll. Medicine) Tactile sensitivity of the phalanges. *Percept. mot. Skills*, 1962, 14(3), 351-354.—Pressure sensitivity was determined in the 3 phalanges of the 4 fingers of each hand in a male and in a female S. 24 daily measures were taken for each of the 12 phalanges in both Ss (576 thresholds). The left hand of each S was significantly more sensitive than the right hand. The distal phalanx was significantly more sensitive than each of the 2 proximal phalanges. The proximal phalanx was more sensitive than the middle phalanx. The relationship of distality and use of the parts to tactual sensitivity is discussed.—W. H. Guertin.

HEARING

2359. Anderson, Clint DeWitt. (Indiana U.) A six-interval observation experiment in audition. *Dissert. Abstr.*, 1961, 22(5), 1720.—Abstract.

2360. Flanagan, James L. Models for approximating basilar membrane displacement: II. Effects of middle-ear transmission and some relations between subjective and physiological behavior. *Bell Sys. tech. J.*, 1962, 41(3), 959-1009.—The report describes a rational function approximation of middle-ear transmission. This result, in combination with previously derived models for the inner ear, permits an analytical approximation of basilar membrane displacements in both apical and basal regions. Because the models are rational functions, they can, if desired, be simulated by lumped-constant electrical networks. Their computational tractability also permits straightforward approximations to temporal and spatial derivatives of displacement. Relations between computed membrane displacement and subjective behavior are illustrated for pitch percep-

tion, binaural lateralization, binaural time-intensity trade, threshold discrimination, and pure-tone masking.—A. M. Small, Jr.

2361. Jeffress, Lloyd A. (U. Texas) Absolute pitch. *J. Acoust. Soc. Amer.*, 1962, 34(7), 987.—"It is suggested that absolute pitch, while found almost exclusively among musical families, is not inherited, but rather, that acquiring it partakes of the nature of 'imprinting'—a peculiar type of early learning."—A. M. Small, Jr.

2362. MacDorman, Carroll Fredric. (U. Arizona) The effects of variations of rhythmical components upon the accuracy of synchronization. *Dissert. Abstr.*, 1961, 22(3), 924.—Abstract.

2363. Tobias, Jerry V., & Jeffress, Lloyd A. (U. Texas) Earphone response and onset time. *J. Acoust. Soc. Amer.*, 1962, 34(6), 857-858.—"Measurements were made of the transient response of PDR-8 earphones. These data indicate that the original estimate of the onset duration of auditory stimuli can be revised downward to 0.8 msec. Implicit in the results is a caveat on the faith one should have in the output of commonly used earphones for short signals."—A. M. Small, Jr.

Measurement

2364. Blodgett, Hugh C., Jeffress, Lloyd A., & Whitworth, Randolph H. (U. Texas) Effect of noise at one ear on the masked threshold for tone at the other. *J. Acoust. Soc. Amer.*, 1962, 34(7), 979-981.—"It has been found that when noise and signal are presented at one ear and noise alone to the other, the threshold for a tonal signal is lower than when the signal too is presented to both ears. The present study is concerned with this phenomenon as a function of the level of noise in the ear not receiving the signal, and as a function of the noise level in both ears. Findings indicate that the signal level must be increased as noise level increases and this increase is more rapid for the monaural than for the binaural condition."—A. M. Small, Jr.

2365. Corso, J. F. (Pennsylvania State U.) Bodily position and auditory thresholds. *Percept. mot. Skills*, 1962, 14(3), 499-507.—The purpose of the study was to determine the effects of bodily position on the threshold of hearing for pure tones. The main effects of position, frequency, and Ss were all significant at the .01 level. The results tend to support the general hypothesis of sensory interaction produced by the simultaneous stimulation of the auditory and vestibular modalities. The magnitude of the interaction effect, however, is probably too small to be of any practical significance.—W. H. Guertin.

2366. Craig, James Harvey. (U. Texas) The effect of phase on the quality of a two-component tone. *Dissert. Abstr.*, 1961, 22(6), 2074.—Abstract.

2367. Creelman, C. Douglas. (U. Michigan) Human discrimination of auditory duration. *J. Acoust. Soc. Amer.*, 1962, 34(5), 582-593.—A series of experiments measured human ability to discriminate between durations of auditory signals and the increment duration, ΔT . A decision-theoretical model is presented, based on a "counting mechanism," which operates on impulses generated over the relevant durations. The source of these impulses is assumed to be random. Limitations on performance come from uncertainty regarding the end points of the time in-

terval and from limited memory. The decision processes underlying the model are presented as a general theory of duration discrimination.—*A. M. Small, Jr.*

2368. de Boer, E. Note on the critical bandwidth. *J. Acoust. Soc. Amer.*, 1962, 34(7), 985-986.—Data from 17 experiments are plotted on a single graph and compared with respect to the size of the auditory critical band. An attempt is made to explain discrepancies present in this graph.—*A. M. Small, Jr.*

2369. Diercks, K. Jerome, & Jeffress, Lloyd A. (U. Texas) Interaural phase and the absolute threshold for tone. *J. Acoust. Soc. Amer.*, 1962, 34(7), 981-984.—"The present study agrees with earlier ones that the binaural absolute threshold is about 3 db lower than the monaural. It also finds that reversing the interaural phase of the signal lowers the threshold still further. The findings are shown to indicate the likelihood that so-called absolute thresholds are really masked thresholds, with the masking noise present internally and exhibiting a small positive correlation."—*A. M. Small, Jr.*

2370. Goldburt, S. N. (Ukhtomskii Physiological Inst., Leningrad, USSR) Svoebrazie krivyykh sil'y-ditel'nosti vozhuzhdennoy slukhovogo analiza-tora cheloveka v usloviyakh posledestviia tonal'nogo razdrzheniia (na fone tak nazyvamoj ostatochnoi maskirovki). [Peculiarities of intensity-duration curves of the excited auditory analyzer in man during aftereffect of tonal stimulation (against background of so-called residual masking).] *Biophysika*, 1962, 7(3), 336-344.—The author discusses the results of a study on "intensity-duration curves of the excited auditory analyzer," which are ascertained in accordance with P. O. Makarov's "principle of dynamic measurement of thresholds at different intervals in the development of excitation." These curves are distinguished by their greater steepness as compared with those measured in quiet.—*I. D. London.*

2371. Goldstein, David P., Hayes, Claude S., & Peterson, John L. (U. Wisconsin) A comparison of bone-conduction thresholds by conventional and Rainville methods. *J. speech hear. Res.*, 1962, 5(3), 244-255.—12 Ss with sensorineural hearing losses, 13 with conductive hearing losses, and 12 with mixed hearing losses were used to compare Rainville bone-conduction thresholds to conventional bone-conduction thresholds. The 2 methods for the sensorineural group closely approximated each other. For the conductive and mixed hearing loss groups the thresholds obtained by the 2 techniques were similar at 2000 and 4000 cps but significantly different at 250 and 500 cps, with the Rainville technique yielding higher thresholds.—*M. F. Palmer.*

2372. Guttman, Newman, & Pruzansky, Sandra. (Bell Telephone Lab., Murray Hill, N. J.) Lower limits of pitch and musical pitch. *J. speech hear. Res.*, 1962, 5(3), 207-214.—9 listeners were selected from the chorus of the Bell Telephone Laboratories on the assumption that they could make accurate octave matches at ordinary frequency level and had no hearing defects. The lower limit of pitch perception in these listeners was 19 cps. With the same stimulus an attempt was also made to assess the lower limit of musical pitch, which seemed to be 60 cps. Perception is too weak to support octave perception in the range from 19 to 60 cps. A stimulus consisting of a train of uniform unipolar pulses is appropriate to the study of pitch.—*M. F. Palmer.*

2373. Hamilton, P. M. (Philco Corp., Palo Alto, Calif.) Underwater hearing thresholds. *J. Acoust. Soc. Amer.*, 1962, 34(6), 857.—Several factors are suggested which may account for differences between data gathered in 2 recent experiments by Hamilton and by Montague & Strickland (see 32: 4999; 36: 4BM76M).—*A. M. Small, Jr.*

2374. Indiana University Hearing and Communication Laboratory. Final report for Contract AF 19(604)-1962. *USAF ESD tech. Rep.*, 1961, No. 61-49. v, 28 p.—20 abstracts of research on receiver operating characteristics in the detection and recognition of auditory signals in noise from 1956 to 1961.—*N. B. Gordon.*

2375. Lochner, J. P. A., & Burger, J. F. (National Physical Research Lab., Pretoria, South Africa) Pure-tone loudness relations. *J. Acoust. Soc. Amer.*, 1962, 34(5), 576-581.—Using 3 sets of independently established equal loudness contours and making certain assumptions regarding the relation between loudness and stimulus intensity, a set of curves of loudness as a function of frequency with intensity as parameter is presented.—*A. M. Small, Jr.*

2376. Loeb, Michel, & Fletcher, John L. (USA Medical Research Lab., Fort Knox) Reliability and temporal course of temporary and contralateral threshold shifts. *J. speech hear. Res.*, 1962, 5(3), 284-291.—Reliabilities of temporary threshold shift (TTS) and contralateral threshold shift (CTS) were measured at varying intervals after initiation or production by click or noise stimuli. CTS reliabilities ranged from low to moderate. TTS reliability was higher, especially immediately after exposure, but TTS reduction reliability would presumably be lower.—*M. F. Palmer.*

2377. Rittman, Paul Anthony. (U. Oklahoma) Pure-tone masking by narrow noise bands in normal and impaired ears. *Dissert. Abstr.*, 1961, 22(4), 1266.—Abstract.

2378. Studebaker, Gerald A. (U. Oklahoma Medical Cent.) On masking in bone-conduction testing. *J. speech hear. Res.*, 1962, 5(3), 215-227.—Functional separation of 2 ears during bone-conduction testing requires the use of contralateral masking. The author presents a formula for deriving the required noise level for each S. Narrow-band noise requires less intensity to produce a given pure-tone threshold shift than broad-band noise. Noise presented to one ear elevates the threshold of the opposite ear at noise levels which are not sufficient to produce peripheral masking. An earphone designed to reduce the area of the head exposed to a masking noise increases the interaural attenuation.—*M. F. Palmer.*

Speech Perception

2379. Gold, Bernard. (Lincoln Lab., Lexington, Mass.) Computer program for pitch extraction. *J. Acoust. Soc. Amer.*, 1962, 34(7), 916-921.—It is assumed that pitch extraction obtained by visual inspection of a speech wave is the best pitch extraction obtainable. A computer program has been written which aims to detect pitch as well as this ideal. For most of the sentences tried, the computer results were as good as the "ideal."—*A. M. Small, Jr.*

2380. Lieberman, Phillip, & Michaels, Sheldon B. (Air Force Cambridge Research Lab., Bedford, Mass.) Some aspects of fundamental frequency and envelope amplitudes as related to the emo-

tional content of speech. *J. Acoust. Soc. Amer.*, 1962, 34(7), 922-927.—3 male native speakers of American English read 8 neutral test sentences in certain "emotional" modes, i.e., as a question, an objective statement, a fearful utterance, etc. Tapes were recorded and presented to separate groups of naive Ss who categorized the emotional modes in forced judgment tests. Results of the tests show that with unprocessed speech, the listeners were able to correctly identify the emotional content 85% of the time. When only pitch information was presented, correct identification was made 44% of the time. When amplitude information was added to the pitch information, the identification rose to 47%. A 120-cps monotone with amplitude information derived from the original speech envelope amplitude resulted in 14% identifications.—A. M. Small, Jr.

2381. Moser, H. M., & Fotheringham, W. C. **Intelligibility of beginning and ending consonants with the vowel [I].** *USAF ESD tech. Note*, 1961, No. 61-37. (Ohio State Res. Found. Proj. 1080, tech. Rep. 65) 19 p.—Consonants and consonant clusters with the vowel (I) were formed into CV and VC stimuli and were spoken by male and female speakers in random noise to phonetically trained listeners. The study provided the bases for the following conclusions. The rank order of consonant intelligibility varies with speakers but is significantly more stable for initial consonants and for speakers of the same sex. Final consonants are more intelligible than initial consonants. Confusions among initial and final consonants are similar. Confusions are most frequent among members of the same class of consonants, e.g., stops, fricatives, nasals. Consonant clusters tend to be less intelligible than single consonants. Confusions for consonant clusters are similar in class to component sounds of a cluster. Given the intelligibility values of consonants composing a cluster, no definitive prediction can be made of the intelligibility of the cluster.—N. B. Gordon.

2382. Ohio State University Research Foundation. **Consonant intelligibility with selected vowels in quiet and noise.** *USAF ESD tech. Note*, 1961, No. 61-36. 9 p.—"Nineteen consonants and the vowel in isolation were paired . . . to form CV and VC syllables. The results support the general conclusion that low signal intensity is a satisfactory substitute for masking noise in testing consonant intelligibility. Testing conditions of comparable difficulty produce approximately the same intelligibility values, and similar confusion frequencies."—N. B. Gordon.

2383. Schubert, Earl D., & Schultz, Martin C. (Indiana U.) **Some aspects of binaural signal selection.** *J. Acoust. Soc. Amer.*, 1962, 34(6), 844-849.—2 experiments are reported which measure the increase in intelligibility occasioned by listening binaurally to running speech imbedded in interfering signals. In the 1st experiment, the frequency range of the speech is restricted to 1 of 3 ranges and the interfering signal is broad-band random noise. Under difficult listening the lowest frequency range shows a binaural improvement of 33% for a change in interaural polarity, and of 28% for an interaural time disparity of 500 μ sec. The middle- and high-frequency ranges show less binaural gain. The 2nd experiment compares the effects of different speech waves masking the wanted speech in binaural listening. The binaural system helps most when the interfering wave

is the speaker's own voice or a multiple mixture of many voices. The measured differences between homophasic and binaural listening are small but statistically reliable. The interaural differences employed (time delay and polarity reversal) are no help when the interfering wave is a female voice, another male voice, or the multiple mixture played backward.—A. M. Small, Jr.

2384. Swets, John A., Millman, Susan H., Fletcher, William E., & Green, David M. (Bolt Beranek & Newman, Cambridge, Mass.) **Learning to identify non-verbal sounds: An application of a computer as a teaching machine.** *J. Acoust. Soc. Amer.*, 1962, 34(7), 928-935.—"The procedures of automated instruction-continual interrogation and overt response, immediate knowledge of results, presentation of successive items conditional upon previous performance, learner-controlled pacing of the lesson, and so forth were applied to the task of learning to identify multidimensional, nonverbal sounds. These procedures produced results that are comparable to those obtained previously with conventional training methods. Certain of the central features of automated instruction were found to hinder learning in the task studied."—A. M. Small, Jr.

2385. Webster, John C., & Klumpp, Roy G. (USN Electronics Lab., San Diego, Calif.) **Effects of ambient noise and nearby talkers on a face to face communication task.** *J. Acoust. Soc. Amer.*, 1962, 34(7), 936-941.—From 1 to 5 talker-listener pairs, talkers seated shoulder-to-shoulder on one side of a table with listeners on the other, communicated word lists in conditions of quiet and noise. Each talker read 1 word at a time to his listener-partner, who repeated back each word for verification by the talker. Talker-listener pairs were instructed to maintain an accuracy of 90% or better. For the lower noise levels, the speech level of a central pair increased about 5 db for an additional 10 db of noise or for each doubling of the number of pairs around them. The rate of utterance decreased with noise but showed no clear-cut pattern of change as the number of additional talkers was varied. In general, for a constant noise level, increasing the number of talkers results in increasing errors; and for 3 or fewer talker-listener pairs, percent error does not increase until the ambient-noise level reaches 85 db.—A. M. Small, Jr.

PARAPSYCHOLOGY

2386. Casler, L. (345 Riverside Dr., N. Y.) **The improvement of clairvoyance scores by means of hypnotic suggestion.** *J. Parapsychol.*, 1962, 26, 77-87.—A preliminary experiment gave significantly higher ESP scores after hypnotic suggestions of confidence and improved performance but not after waking suggestions. Following this lead, a new experiment was designed to test the effect of hypnosis upon ESP. The investigation involved 15 Ss, each of whom did 100 standard card trials in the trance state with suggestions and 100 trials in the waking state without suggestions. The hypnosis ESP trials were significantly higher in scores. While a definite interpretation must wait for further research, the results may offer a way of gaining better control over psi phenomena.—J. G. Pratt.

2387. Forwald, H. (Box 4611, Ludvike, Sweden) **A PK dice experiment with doubles as targets**

and non-targets. *J. Parapsychol.*, 1962, 26, 112-122. —2 dice were thrown for "doubles" (identical faces on the 2 dice) until a specified number of doubles had been obtained. In one subseries the E, acting as his own S, concentrated upon having the doubles appear in as few throws as possible, and in another subseries, he tried to take as many throws as possible, in getting the same number of doubles. The results come out in agreement with the S's intention, with $P < 10^{-4}$. A statistic appropriate for testing significance when the variable is the number of trials is described and applied.—J. G. Pratt.

2388. Freeman, J. A. (Duke U.) **An experiment in precognition.** *J. Parapsychol.*, 1962, 26, 123-130.—Ss from a college undergraduate population were challenged to show that they could do better at an ESP test of precognition than on one of clairvoyance. To build confidence, the E pointed out that precognition is the most frequent form of ESP in the spontaneous experiences from everyday life. A complicated routinized procedure was followed to insure the use of future targets chosen without any subjective influence. In a series set in advance at 1000 trials the precognition results were significant at the .011 level, while the clairvoyance trials scored slightly below mean chance expectation.—J. G. Pratt.

2389. Rhine, L. E. (Duke U.) **Psychological processes in ESP experiences: I. Waking experiences.** *J. Parapsychol.*, 1962, 26, 88-111.—In a collection of more than 7000 cases of spontaneous parapsychical experiences, approximately 2000 that were incomplete in some respect were analyzed for clues regarding the psychological processes involved in the emergence of ESP experiences into consciousness. The present paper deals with cases drawn from waking life, and they are classified under the headings of intuitive experiences and hallucinations. The ESP act appears to become separated into elements at the unconscious level. In the former group only the feeling or conative aspects reach consciousness, while in the latter the experience is projected in terms of a sensory modality. The findings suggest that laboratory tests of ESP may be giving only a conservative indication of the S's ability.—J. G. Pratt.

2390. Rhine, L. E. (Duke U.) **Psychological processes in ESP experiences: II. Dreams.** *J. Parapsychol.*, 1962, 26(3), 172-199.—In this paper the study of incomplete parapsychical experiences from everyday life is extended to dreams to find the psychological processes involved. In realistic dreams, the content-bearing imagery is not an automatic reproduction of reality, but the content is accomplished in several ways below the level of consciousness under the influence of personal factors. Unrealistic dreams show that such personal factors may lead to an association of ideas before the imagery is formed. Thus, the examination of both waking and dream experiences in the complete study indicates that psychological processes below the level of consciousness are involved which begin with the initial judgment and extend to the final interpretation of the imagery.—J. G. Pratt.

2391. Rice, G. E., & Townsend, J. (Agnes Scott Coll., Decatur, Ga.) **Agent-percipient relationship and GESP performance.** *J. Parapsychol.*, 1962, 26(3), 211-217.—The hypothesis was that, in a sender-receiver ESP test, pairs of Ss who share a close emotional relationship would score higher than couples

who were not close. 4 man-woman pairs who were close and 4 who were not were tested with ESP cards. Each member of each pair completed 4 runs as receiver and 4 runs as sender. For all the runs, the sender and the receiver were in separate rooms with a solid wall between and with the E sitting where she could see both of them. The 32 runs for the emotionally-related group yielded 48 hits over mean chance expectation, and the unrelated group in the same number of runs scored 45 hits fewer than expected. Thus, both groups are highly significant statistically but with opposite directions of deviation.—J. G. Pratt.

2392. Rýzl, M., & Rýzlová, J. (Rybalkova 4, Prague, Czechoslovakia) **A case of high-scoring ESP performance in the hypnotic state.** *J. Parapsychol.*, 1962, 26(3), 153-171.—The S was tested for ESP of targets providing a 50-50 basis of choice. The targets were presented in random order in opaque covers with safeguarding conditions assured by a 2 E plan. In Series I, with the S hypnotized by the E calls for 2000 separate targets produced 1144 hits ($P = 10^{-9}$). In Series II, with the S in an autohypnotic state, 100 targets sealed in envelopes were called 10 times each in the presence of the E, followed by 10 times the S working alone. By the majority vote principle, the calls made in the presence of the E were correct for 66 targets and incorrect for 27 (with tie votes for the remaining 7). By chi square, the ratio of 66/27 where an equal distribution is expected yields $P = .00008$. The results suggest that more reliable control over ESP can be achieved through hypnosis.—J. G. Pratt.

2393. Shields, E. (4840 W. 139th St., Hawthorne, Calif.) **Comparison of children's guessing ability (ESP) with personality characteristics.** *J. Parapsychol.*, 1962, 26(3), 200-210.—The E, an elementary-school psychologist, incorporated an ESP test into the usual interviewing and testing of pupils referred to her. The ESP tests, especially designed to appeal to children, yielded statistically significant results with striking positive scores being contributed by those Ss who were not psychologically withdrawn in their social relations. Those Ss who were classified as withdrawn gave scores that were generally below mean chance expectation. No significant correlation was found between ESP and sex, age, or intelligence.—J. G. Pratt.

2394. Sinclair, Upton. **Mental radio.** Springfield, Ill.: Charles C Thomas, 1962. xv, 237 p. \$8.50.—Contains the complete text of the 1929 edition plus a reprint of the lengthy 1932 commentary on that text by the Research Officer of the Boston Society for Psychic Research. The original text describes the Sinclairs' careful studies of Mrs. Sinclair's telepathic and clairvoyant abilities.—R. S. Harper.

ENVIRONMENTAL EFFECTS

2395. Jackson, C. Wesley, Jr., & Pollard, John C. (U. Michigan) **Sensory deprivation and suggestion: A theoretical approach.** *Behav. Sci.*, 1962, 7(3), 332-342.—Evidence is presented that the "hallucinations" and "delusions" found in sensory deprivation are not due to disorganization within the individual either on a physiological or psychological level, and they were not primarily due to the various manipulations of such physical dimensions as stimulus patterning, stimulus intensity, social isolation etc.

Some doubt is expressed as to whether these phenomena are the same as psychotic behaviors or have a common causal basis. The present explanation is on the basis of the S's knowledge of what is "appropriate" or "expected," the S's motivations to either report or not report these "appropriate" experiences, and the use of continuous reporting or "free associative" instructions. (50 ref.)—*J. Arbib.*

2396. Levy, Edwin Z. The subject's approach: Important factor in experimental isolation? *Bull. Menninger Clin.*, 1962, 26(1), 30-42.—Studies of experimental isolation have involved a wide scope of differences in sense limiting techniques, in Ss used, in effects reported, and in explanations offered of results. The S's approach to the experiment and such issues as the degree of control he can exert and the amount of communication between S and observer must be considered. Particular reference is made to the Aerospace Medical Laboratory studies of isolation.—*W. A. Varvel.*

SLEEP & FATIGUE

2397. Berger, Ralph J., & Oswald, Ian. (U. Edinburgh, Scotland) Effects of sleep deprivation on behaviour, subsequent sleep, and dreaming. *J. ment. Sci.*, 1962, 108(Whole No. 455), 457-465.—Following 108 hours of sleep deprivation, the 1st recovery night showed, by EEG, an increase in percentage of time spent in deep sleep and the 2nd recovery night an increase in dream time. Sleep deprived persons can maintain vigilance briefly, but the insistent downward drift of cerebral vigilance is accompanied by changes in thinking and perception which are comparable to dreams.—*W. L. Wilkins.*

2398. Bujas, Z., Petz, B. Krković, A., & Sorokin, B. (Inst. za Medicinska Istraživanja, Zagreb) Faktorska analiza intelektualnog rada u stanju svježine i u stanju umora. [Factor analysis of intellectual work with and without fatigue.] *Arch. Hig. rada*, 1960, 11, 203-220.—A battery of 12 mental tests was given to the experimental group while in a state of nervous and physical fatigue, and to the rested control group. There were no significant differences between the 2 groups in average results and variability. However Tryon's cluster analysis showed that in the control group all the tests of similar or same factorial structure yielded a cluster, whereas in the experimental group the logic of clusters was completely disarranged; tests with similar factorial structure did not show clusters. Moreover, some tests with different factorial structure gave some profiles of a similar shape. These results support the hypothesis that under fatigue a certain disintegration of the functions that are used when the work is performed without fatigue is likely to occur and also some new integration on a new level.—*B. Petz.*

MOTIVATION & EMOTION

2399. Hoffman, H. S., & Bell, R. W. (Pennsylvania State U.) Comment on "Early Vibratory Experience and the Question of Innate Reinforcement Value of Vibration and Other Stimuli: A Limitation on the Discrepancy (Burnt Soup) Principle in Motivation." *Percept. mot. Skills*, 1962, 14(1), 133-134.—Several experimental flaws in a recent article are discussed, with particular emphasis upon the inadequacy of the dependent variable as an indicator of

learning. The importance of avoiding such errors is commented upon.—*W. H. Guertin.*

2400. Iakobson, P. M. *Psikhologičeskii chuvstvy.* [The psychology of feelings.] Moscow, USSR: Publishing House RSFSR Academy Pedagogical Sciences, 1958. 284 p.—The author treats of feelings in general, their formation, and their training. Included are chapters on methods for the study of feelings, feelings and personality, and the physiological bases of feelings. There is an appendix of 84 illustrative photographs.—*I. D. London.*

2401. Willett, R. A., & Eysenck, H. J. (U. London, England) An experimental study of human motivation. *Life Sci.*, 1962, No. 4, 119-127.—"An experimental test is reported of the hypothesis that reminiscence is a function of motivation. Using the pursuit rotor with pre-rest work periods of 12 and 15 min, groups of high and low drive subjects were found to give reminiscence scores in line with prediction; even with such long periods of work there was no evidence of approach to an asymptote in the high drive group. Performance scores did not differentiate between the groups; this was not in line with prediction and throws doubt on the adequacy of the original theoretical formulation. Suggestions were made regarding possible changes in the theory to incorporate these findings."—*C. T. Morgan.*

PSYCHOMOTOR TASKS

2402. Abbey, D. S. (U. Toronto) Age, proficiency, and reminiscence in a complex perceptual-motor task. *Percept. mot. Skills*, 1962, 14(1), 51-57.—3 groups of pre-adult Ss differing in mean ages received 5 training sessions on the Reversed Task of the Toronto Complex Coordinator. Sessions were separated by periods of 6 mo., and consisted of 2 5-min. practice periods separated by a 20-min. rest. A regression of posttest on pretest performance in terms of number of matches was calculated for each age group. The 3 slopes were found to be significant and heterogeneous. This finding is consistent with the general hypothesis that reminiscence decreases as skill improves and demonstrates that performance approaches an asymptote as a function of both age and practice.—*W. H. Guertin.*

2403. Ammons, C. H., & Ammons, R. B. (Montana State U.) Motor skills bibliography: XXIX. Psychological Abstracts, 1956, Volume 30, Second Half. *Percept. mot. Skills*, 1962, 14(3), 483-486.—90-item bibliography. One of a series which began prior to 1933.—*W. H. Guertin.*

2404. Behling, Orlando Charles. (U. Wisconsin) Television analysis of the behavioral aspects of tool-using. *Disser. Abstr.*, 1961, 22(3), 922.—*Abstract.*

2405. Botwinick, J., & Brinley, J. F. (National Inst. Mental Health) Aspects of RT set during brief intervals in relation to age and sex. *J. Gerontol.*, 1962, 17, 295-301.—4 hypotheses regarding age differences in reaction time (RT) set were tested. One hypothesis was found tenable indicating that "elderly men seemed to require more time than young men to overcome inaccurate expectations, and this was not accounted for by their over-all slowing." RT set patterns of women Ss were different in that an age-sex interaction of RT was found in some of the RT data.—*J. Botwinick.*

2406. Chaplin, Mary Rose, & Pollack, R. H. The after-effects of prolonged arm extension. *Acta psychol., Amsterdam*, 1962, 20(1), 24-28.—The notion that maintaining an arm at full horizontal stretch for 2 minutes is equivalent to the visual fixation of a rectangle at a given height is untenable. Inspection heights themselves are displaced upward or downward depending on the direction from which kinaesthetic stimulation is induced. The loci of test heights are not determining variables as far as the magnitude of their displacement is concerned.—G. Rubin-Rabson.

[Information processing in a situation of choice. Communication II. Choice RT as function of the amount of specific information in an area ranging from 0 to 4 binary units.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1962, No. 2, 65-70.—Ss (not described) were reacting by means of a key to visual stimuli occurring with a probability of $p \leq \frac{1}{2}$, and $p \geq \frac{1}{2}$. It was found: (a) RT is a function of the specific amount of information, which can be expressed by the formula: $RT = a + b \log I$. (b) The important factors are the complexity of choice and the mutual relationship between the rarely and frequently occurring signals.—A. Cuk.

2413. McCormack, P. D., Binding, F. R. S., Chylinski, J. (U. Manitoba) *Effects on reaction-time of knowledge of results of performance.* *Percept. mot. Skills*, 1962, 14(3), 367-372.—Ss depressed a switch as fast as possible in response to the presentation of a light which appeared on the average once per minute with the intervals between lights being 30, 45, 60, 75, and 90 sec. Under the knowledge treatment a red or a green light was illuminated immediately following each response. The former indicated a reaction-time which was slower than the previous one while the latter signalled a faster response. For the 2 no-knowledge treatments, reaction-time increased with time on task and decreased with length of interstimulus interval. Under the knowledge condition, however, performance remained invariant with respect to both task duration and interval length.—W. H. Guertin.

2414. Molnár, Imre. (Hungarian Academy Science) *Sorozatos szokáscselekvés átállításánál adódó konfliktushelyzet kísérleti vizsgálata.* [An experimental study of conflict situations arising from changes in a sequence of movements.] *Pszichol. Tanulmányok*, 1, 1958, 105-120.—A series of experiments with children showed that "when the order in an automatized sequence of movements is changed, the more mistakes occur the farther the position of the affected member is within the stereotyped succession." A rat experiment using an approach-approach conflict to disrupt an automatized sequence resulted in the same phenomenon. It seems that the "sensory point of the first reaction is excited only by its own adequate stimulus, with the later member the case is different: the irritating stimulus coming from the previous members and the summation of kinaesthetic feedbacks of the reactions results in a firmer automatization even if the number of repetitions has been identical." (Russian & English summaries)—E. Friedman.

2415. Pierson, W. R., & Rasch, P. J. (California Coll. Medicine, Los Angeles) *Strength and speed.* *Percept. mot. Skills*, 1962, 14(1), 144.—26 medical students underwent a 4-week weight training program. While each exercise demonstrated significant increase in the strength of the Ss, it was unrelated to change in speed of reaction or arm extension.—W. H. Guertin.

2416. Sheldon, Richard Wallace. (State U. Iowa) *Tendency to analyze as a factor in the acquisition and reacquisition of skill on successive serial motor tasks.* *Dissert. Abstr.*, 1961, 22(5), 1727.—Abstract.

2417. Smith, Hope M., & Clifton, Marguerite A. (U. California, Los Angeles) Sex differences in expressed self-concepts concerning the performance of selected motor skills. *Percept. mot. Skills*, 1962, 14(1), 71-73.—23 male and 37 female college volunteers rated themselves on their own performance of 5 motor skills. Ratings were indicated by Ss' selections of descriptive words and phrases from a checklist. These selections were described by Ss as favorable and/or unfavorable descriptions of their performance. The hypothesis that the male Ss would rate themselves more favorably than would the females was supported. Greatest disparities between the groups were observed in the rating of performance of those skills which required more energy output and strength.—W. H. Guertin.

2418. Smith, Leon E., & Harrison, John S. (U. California, Riverside) Comparison of the effects of visual, motor, mental, and guided practice upon speed and accuracy of performing a simple eye-hand coordination task. *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(2), 299-307.—6 different groups of 10 male university students were each given a 1-minute speed test-retest on a 3-hole stylus punchboard. To compare the effects of visual, motor, mental, and guided practice upon the speed and accuracy of the performance of a simple eye-hand coordination task, 5 groups received different types of practice between the tests. One group acted as a control and read between tests. The control, motor practice, and reversed-visual practice groups significantly improved performance in terms of correct hits and the total number of trials; they did not, however, reduce their number of errors. The visual and mental practice groups reduced their total number of errors and also increased their performance significantly in terms of correct hits and total number of trials. It was concluded that visual practice and mental practice improved accuracy on a punchboard learning task, whereas motor practice and guided practice did not.—*Journal abstract*.

2419. Smoot, Kenneth E., & Lawson, Reed. (U. Missouri) Performance after failure as a function of interpolated activity. *J. genet. Psychol.*, 1962, 100(2), 205-213.—60 college students were forced to fail on 10 complex card-sorting trials. They were then given 1 of 6 interpolated conditions: rest-success, no rest-success, rest-neutral, no rest-neutral, rest-failure, and no rest-failure. Following the interpolated period they were each given 5 "neutral" card-sorting trials. The work by affect interaction mean square based on "reminiscence scores" was significant ($p < .01$). No rest-success produced the greatest gain in efficiency on the 1st post-interpolation trial, followed by rest-neutral, no rest-failure, rest-failure, rest-success, and no rest-neutral in that order. Rest most effectively altered the influence of induced failure when there was no affect involved during the rest period; success was best applied in the former failure task, while interpolated failure had a similar effect under both rest and no rest conditions.—*Author abstract*.

2420. Sokolov, E. N., & Mikhalevskaya, M. B. (Moscow State U.) Metod testiruyushchego stimula. [The method of the probe stimulus.] *Vop. Psikhol.*, 1962, No. 1, 28-36.—This article is concerned with the use of reaction time to determine the absolute threshold values for sensitivity to light. The index

of sensitivity used is inhibition of the alpha rhythm. The authors have empirically determined the general relation between reaction time and intensity of the light stimulus in threshold units. They have also placed confidence bounds around this function. Now a probe stimulus of a given intensity is presented to a S and reaction time recorded. This is converted to number of threshold units above the absolute threshold and from this the absolute threshold itself can be calculated. This solution is iteratively refined. The authors further apply Bayes theorem to determine the probability that a particular stimulus is above, in, or below threshold range given that it yielded a particular reaction time.—H. Pick.

2421. Sui Lan Tsan. (Inst. Psychology, RSFSR Pedagog. Acad. Sciences) K voprosu o metodike izucheniia éffektivnosti reaktsii v zavisimosti ot kolichestva informatsii. [Method of studying effectiveness of reactions as related to the amount of information.] *Dokl. Akad. Pedagog. Nauk RSFSR*, 1961, No. 5, 81-84.—12 students were trained to choose between positive and negative visual stimuli ranging from simple to very complex. RT and errors were recorded. Linear relationship was found between dependent and independent variables. The importance of subjective factors was pointed out. Many Ss made an attempt to organize stimuli into "mental structures."—A. Cuk.

2422. Witte, Fae. (U. California, Santa Barbara) Effect of participation in light, medium, and heavy exercise upon accuracy in motor performance of junior high school girls. *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(2), 308-312.—The purpose of this study was to investigate the effects of varying amounts of exercise on accuracy in throwing a softball. The Ss, 56 junior high school girls, were classified as either skilled or unskilled performers, and accuracy measures were taken following 5, 10, and 20 bouts of activity. It was concluded that: (a) there is no difference in the effect of light exercise as compared with moderate and heavy exercise on the throwing accuracy of either the skilled or the unskilled subjects, (b) unskilled Ss show a higher degree of accuracy following exercise at each of the 3 levels of duration than they do following no exercise, and (c) skilled Ss show no change in accuracy following light and moderate exercise, but they show a decrease in accuracy following heavy exercise.—*Journal abstract*.

ATTENTION & SET

2423. Aftanas, M. S., & Koppenaal, R. J. (U. Manitoba) Effects of instructional problems and jar position variation on the water-jar Einstellung test. *Psychol. Rep.*, 1962, 10(2), 359-362.—The percentage of Einstellung (E)-solutions of the water-jar test among 176 highschool students was investigated as a function of instructional problems, positional order of jar sizes, and amount of training on problems allowing only E-solutions. A significantly larger percentage of E-solutions occurred among Ss given Luchin's instructional problems than those given instructions which demonstrated 2 kinds of solutions. More E-solutions were obtained from Ss given 6 training problems than those tested immediately after instruction.—B. J. House.

2424. Egorov, A. C. (Dept. Psychology, Inst. Physical Culture Lesgafta, Leningrad, USSR) Eks-

perimental'noe issledovanie preodoleniya trud-nostei pridinamicheskoi rabote. [Experimental investigations of overcoming of difficulties during dynamic work.] *Vop. Psikh.*, 1962, No. 1, 19-27.—An investigation was carried out on the effect of 2 forms of set in overcoming increased difficulty in a motor task. One type of set was induced by instructing Ss to react to an increase in difficulty of the task to the degree they felt able. In the other type Ss were admonished to exert all possible effort to overcome difficulty. The task involved pressing an ergograph with the palm of the hand. The increased difficulty consisted of requiring Ss to depress it with 1 finger. The ergogram, PGR, and breathing rate of Ss were recorded along with verbal reports. The 2 types of set were induced successively in the same Ss. Results indicated that the types of set differed in efficiency in completion of the task. Also the physiological indices differed as Ss performed the task under the 2 different sets. This difference was apparently partially dependent on the order of presentation of the tasks.—*H. Pick.*

2425. Gorbov, F. P. (Moscow, USSR) *K voprosu o mekhanizme retro-i anterogradnoi amnezii.* [On the question of the mechanism of retro- and ante-amnesia.] *Vop. Psikh.*, 1962, No. 1, 37-44.—An analysis of lapses of consciousness by persons involved in high speed activities such as flying indicate that a large portion of the lapse of consciousness is actually amnesia. The performance of a highly skilled task during the supposed lapse of consciousness attests to this. A model involving the stages of initial perception, temporary trace, delayed trace, and fused trace (or memory) is presented. One property of the model is that it predicts a temporal spread of loss of memory around the time of a lapse of consciousness. An experiment is described in which a retroactive inhibition paradigm yields results of retro-amnesia based on the model.—*H. Pick.*

2426. Heath, Douglas H. (Haverford Coll.) Reinforcement and drive level determinants of expectancy generalization. *J. gen. Psychol.*, 1962, 67, 69-82.—The effect of different drive levels on expectancy generalization was studied. Ss were individually given different drive inducing instructions and were then asked to estimate the percentile score he expected to achieve on a vocabulary test. Following the test, E either positively or negatively reinforced S's expectancy by reporting falsified scores. Each S then estimated his score on a randomly presented set of 5 varied generalization tasks. The results were: (a) negative reinforcement produced significantly heightened drive levels, greater expectancy changes, and flatter expectancy gradients than positive reinforcement; (b) instructionally induced drive level changes, compared to the reinforcement and task variable effects, had relatively little differential effect on the magnitude and slope of expectancy gradients; and (c) both task physical and reinforcement similarity mediated extensive expectancy generalization following negative reinforcement, but task physical, rather than task reinforcement, similarity mediated more generalization following positive reinforcement.—*Author abstract.*

2427. Loeb, M., & Hawkes, G. R. (USA Medical Research Lab., Fort Knox, Ky.) Detection of differences in duration of acoustic and electrical cutaneous stimuli in a vigilance task. *J. Psychol.*,

1962, 54(1), 101-111.—24 college students were instructed to attend to auditory, cutaneous, simultaneous auditory, and cutaneous, or mixed stimuli presented in separate sessions, and to respond as rapidly as possible by pressing a key when signals of double length occurred. Detection of auditory signals was superior to cutaneous signals and latency was less. Probability of detection for the auditory signals was constant throughout the session, but decreased as a function of time on task for cutaneous signals. Detection of simultaneous signals was similar to that of auditory signals alone. For the mixed stimuli the probability of detection of the auditory and cutaneous signals was approximately the same as their probabilities when presented alone. A possible interpretation for the results is suggested.—*Author abstract.*

LEARNING

2428. Battig, W. F. (U. Virginia) Interrelationships between measures of association and structural characteristics of nonsense shapes. *Percept. mot. Skills*, 1962, 14(1), 3-6.—Measures of association value of nonsense shapes, varying systematically in complexity (number of sides) and curvature, were found to bear little or no relationship to either these or other physical properties of the shapes (area, perimeter, and angular variability). Moreover, a significant decrease in inter-S heterogeneity in content of association responses was obtained for shapes of increasing association value. These results differ markedly from those of previous studies and indicate the existence of complex nonlinear interactions between various physical and perceptual measures, which many render the typically-employed linear correlational techniques inadequate for the investigation of this problem.—*W. H. Guerin.*

2429. Clark, J. W., & Stevenson, W. B. (Dalhousie U., Canada) The influence of fatigue on the rate of acquisition. *Bull. Maritime Psychol. Ass.*, 1962, 11(1), 16-19.—40 male students were given a serial learning task either 15 sec., 2 min., 5 min., or 10 min. following a period of intense physical exertion. The 15-sec. group and the 2-min. group exhibited a higher rate of acquisition than the 5-min. group, with the 10-min group at an intermediate position. Results are discussed in terms of a fatigue-drive-reduction hypothesis and an arousal hypothesis.—*C. W. Page.*

2430. Cratty, Bryant J. (U. California, Los Angeles) Comparison of learning a fine motor task with learning a similar gross motor task using kinesthetic cues. *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(2), 212-221.—60 male university students, divided into 2 groups of 30 were given 12 blind-folded trials to learn each of 2 mazes. The large locomotor maze had an irregular pattern 111.25 ft. long and contained no blind alleys; the smaller stylus maze had a similar pattern 44.5 in. in length. Performance was based upon traversal time, and no errors were recorded. It was found that, while the group learning rates were similar, there was no significant correlation between the traversal times of the 2 tasks. In addition, some transfer between tasks took place, evidenced in learning curves.—*Journal abstract.*

2431. Ihalainen, V. H. (Pitkelahti as. Finland) Über den Einfluss von Aktivität und Motivation auf das Lernen. [The influence of activity and

motivation on learning.] *Psychol. Beitr.*, 1962, 7(1), 3-53.—A series of experiments conducted with 114 students showed that (a) the measure of activity and time needed in dictation-learning experiments corresponded to the learning results of tests that were conducted later and (b) the group in which the work was strongly tied to the life of the Ss reached considerably better results than the group that worked just for the sake of the experiment, or to do the E a favor. (English & French summaries)—H. J. Priester.

2432. Makres, Thomas Peter. (Vanderbilt U.) **A test of Spence-Taylor hypotheses on learning and drive.** *Dissert. Abstr.*, 1961, 22(6), 2081.—*Abstract.*

2433. Purdy, Bonnie J., & Lockhart, Aileene. (Long Beach State Coll.) **Retention and relearning of gross motor skills after long periods of no practice.** *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(2), 265-272.—Retention and relearning of 5 novel gross motor skills after a long period of no practice were studied. College women were classified into high, average, and low skill groups in a previous experiment, and this classification of 36 of the original Ss was retained in the present retesting study. A high degree of skill was retained after approximately 1 year of no practice. Relearning to previously attained skill levels was rapid. There were significant differences among classified high, average and low skill groups in learning, retention, and relearning.—*Journal abstract.*

2434. Rachman, S. (U. London) **Disinhibition and the reminiscence effect in a motor learning task.** *Brit. J. Psychol.*, 1962, 53(2), 149-157.—This study was designed to investigate the operation of disinhibition in humans. 2 groups of Ss were made to perform a motor learning task (pursuit rotor). The Ss in the experimental group were presented with a brief disinhibiting, alien stimulus during their 5 min. practice period. It was predicted that the introduction of this alien stimulus would produce an augmentation of performance level and a reduction in the reminiscence effect. Both predictions received partial confirmation and the results are interpreted in terms of Pavlov's description of inhibition and Eysenck's account of the development and dissipation of reactive inhibition. In an attempt to clarify some aspects of the results, a 2nd experiment was carried out. 4 groups of 10 Ss each were given the same pursuit rotor task to complete. Group A acted as a control, Group B was presented with an alien stimulus early in the 5 min. practice period, Group C late in the practice period, and Group D very late in the practice period. In addition to clarifying some of the earlier results this experiment showed that the effect of an alien stimulus on performance is most marked when it is introduced late in the practice period.—*Journal abstract.*

2435. Ryan, Dean E. (U. California, Davis) **Relationship between motor performance and arousal.** *Res. Quart. Amer. Ass. Hlth. Phys. Educ. Recr.*, 1962, 33(2), 279-287.—40 males Ss were tested on a motor learning task and immediately after each of the learning trials. Ss were then dichotomized on the basis of initial conductance, final conductance, total change in conductance, conductance after trial one, and changes in conductance from rest to trial one. There was no difference in per-

formance between groups when Ss were divided on the basis of initial conductance, but for all other measures performance was significantly better for the group with higher conductance. These results lend support to the concept of an arousal continuum as proposed by Duffy and Malmö.—*Journal abstract.*

2436. Shekhter, M. S. (Inst. Defectology, RSFSR Acad. Pedagog. Sciences) **Izuchenie mekhanizmov simul'tannogo uznaniia: Soobshchenie II. K voprosu o kharaktere razvitiia opoznavatel'nogo protsesssa.** [Study of the mechanism of simultaneous learning: Communication II. Nature of the development of the recognition process.] *Dokl. Akad. Pedagog. Nauk RSFSR*, 1961, No. 5, 97-102.—Discussion on the basis of previously obtained experimental data of the signs used in simultaneous recognition of objects. 2 possibilities are available: completely new signs are used or the old signs employed in the successive recognition of objects are rearranged in a new way. The analysis of data seems to point to a 3d solution combining the other 2.—A. Cuk.

2437. Svyadosch, A. M. (Dept. Psychiatry Medical Inst., Karaganda) **Vospriyatie i zapominanie rechi vo vremya estestvennogo sna.** [Perception and memory of speech during natural sleep.] *Vop. Psikhol.*, 1962, No. 1, 65-80.—Evidence on the ability of persons to perceive speech while sleeping indicates that it is a rare phenomenon. The present investigation attempted to train Ss to do this. Pretraining control tests indicated that Ss who were read to while sleeping or who were awoken at night and read to did not generally remember the text and many didn't even remember being awoken. Training consisted of hypnotic or self-suggestion to the effect that S should listen to text which would be read to him at night and remember it the next day. The experimental test was carried out in the same manner as the non-waking control test. 20 of 25 Ss developed the ability to perceive speech while sleeping. In one case this ability persisted 60 days. (30-item bibliogr.)—H. Pick.

2438. Werner, H., & Kaplan, B. (Clark U.) **Some experiments in support of an organismic theory of symbol-formation.** *Psychol. Beitr.*, 1962, 6(3-4), 484-491.—2 experiments are cited in support of the organismic theory of symbol-formation. The 1st study shows that printed words placed in a darkroom are shifted up and down depending on the up-down directional meaning of these words. The 2nd experiment shows that "meaning lapse" in words through repetition can be delayed if sensory-motor action consonant with the word meaning accompanies the repeated word. (French & German summaries)—H. J. Priester.

Conditioning

2439. Burstein, Kenneth Richard. (Duke U.) **The intensity of the unconditioned stimulus and eyelid conditioning.** *Dissert. Abstr.*, 1962, 22(12), 4417.—*Abstract.*

2440. Champion, R. A., & Jones, Joan E. (U. Sydney, Australia) **Drive level (D) and extinction in classical aversive conditioning.** *J. gen. Psychol.*, 1962, 67, 61-67.—A test was made of the possibility that the delay in extinction with a shift from a favorable to an unfavorable CS-UCS interval after acqui-

sition results from the continued operation of the acquired association or of the expectancy that UCS will follow CS. After both forward and backward conditioning of the GSR, isolated presentations of the noxious UCS (shock) were interspersed with CS (tone)-only trials in the experimental Ss and were completely omitted in the control Ss. The performance of the experimental group rose in extinction whereas that of the control group fell. This result was taken as evidence against the possibilities being tested and as in line with the hypothesis that extinction after classical aversive conditioning is at least partly due to the omission of the drive-producing UCS.—*Author abstract.*

2441. Craddick, Ray A., & Leipold, William D. (New Mexico State U.) **Verbal conditioning: Experimental extinction as a function of the position of a single reinforcer.** *Psychol. Rep.*, 1962, 10(2), 427-436.—200 undergraduates, after training in a verbal conditioning task with continuous reinforcement, received either an immediate extra reinforcement or a single cycle of a 1:5 or a 1:10 fixed ratio partial reinforcement schedule. Partial reinforcement groups showed significantly higher performance rates during a period of nonreinforcement. The same effect was found whether or not Ss were informed of the nature of the desired operant before acquisition; however, the informed groups did not show a decline during the 6-min. nonreinforcement period while the uninformed groups did. Implications of the results for clinical practice were discussed.—*B. J. House.*

2442. Das, J. P., & Mitra, A. K. (Ravenshaw Coll., Cuttack, India) **Relative effectiveness of electric shock and praise and reproof in verbal conditioning.** *J. gen. Psychol.*, 1962, 67, 141-146.—This study intended to find out the relationship between verbal conditioning, types of reinforcement, and personality traits. 50 college students were divided into 2 groups and given the same verbal conditioning test (choosing I or We from I, We, He, She, They to frame a sentence with a verb in past tense) under 2 different reinforcers, (a) verbal praise ("good") and reproof ("wrong") for correct and incorrect responses respectively, and (b) electric shock for incorrect responses. Verbal and shock reinforcers did not produce any difference in the speed of acquisition or extinction, but shock led to significantly greater SD and more stereotyped behavior. Extraversion, neuroticism, rigidity, or intelligence were not significantly correlated with verbal conditioning measures.—*Author abstract.*

2443. de Montmollin, Germaine, & Le Ny, Jean-Francois (Sorbonne, Paris, France) **Conditionnement d'attitude et conditionnement verbal.** [Conditioning of attitude and verbal conditioning.] *Psychol. Franc.*, 1962, 7(1), 67-74.—This study was designed to replicate some American experiments of Staats and Staats (see 33: 741, 7843, 7844; 34: 914) on semantic generalization. There were 85 female Ss divided between 2 groups. The basic attempt to establish semantic conditioning failed so that generalization could not be demonstrated. It was suggested that differences in the kinds of words, in the languages, and in the experimental populations may have contributed to the failure.—*C. J. Adkins.*

2444. Horn, Paul Walter. (Vanderbilt U.) **Eyelid conditioning as a joint function of condi-**

tioned and unconditioned stimulus intensity. *Dissert. Abstr.*, 1961, 22(6), 2079.—*Abstract.*

2445. Levin, Gilbert. (Boston U.) **The operant conditioning of a social response.** *Dissert. Abstr.*, 1961, 22(4), 1265.—*Abstract.*

2446. Levin, Gilbert, & Shapiro, David. (Harvard Medical School) **The operant conditioning of conversation.** *J. exp. Anal. Behav.*, 1962, 5(3), 309-316.—4 experiments were conducted to test whether differentially reinforcing a group of speakers can bring the order of speakers under experimental control. The results are all consistent with the hypothesis. The paper also devises and evaluates different procedures for studying conversational sequences and examines associated statistical problems.—*J. Arbit.*

2447. Levine, G., & Lipinski, C. E. (Creedmoor Inst. Psychobiologic Studies) **Generalization of stimulus-response pairing.** *Percept. mot. Skills*, 1962, 14(1), 47-50.—Ss were conditioned to 2 of 4 individually presented stimuli. Ss were presented with 4 possible responses, shown horizontally, allowing S to see them as constituting a spatial sequence. 2 alternately ranked responses were conditioned to mutually ranked stimulus values. A test for stimulus-response generalization yielded the hypothesized increase in the use of nonconditioned responses to nonconditioned stimuli and a decrease in conditioned responses to nonconditioned stimuli.—*W. H. Guertin.*

2448. Levine, G., & Weitzman, B. (Creedmoor Inst. Psychologic Studies) **Supplementary report: Generalization of stimulus-response pairing.** *Percept. mot. Skills*, 1962, 14(3), 515-516.—20 Ss were conditioned to respond with 2 of 4 possible responses to 2 of 4 individually presented stimuli, each response to one stimulus. All 4 possible responses were always present, but 2 were never reinforced, so that extinction could occur on the use of the 2 nonconditioned responses. The experiment was run to discover whether the addition of extinction to the paradigm would reverse the previous findings of generalization of stimulus-response pairing. The results supported the previous findings, rather than reversing them.—*W. H. Guertin.*

2449. McDonell, Carol R., & Inglis, James. (Queens U., Kingston, Ontario) **Verbal conditioning and personality.** *Psychol. Rep.*, 1962, 10(2), 374.—Verbal conditioning and extinction scores of 65 undergraduates showed no relationship to introversion-extroversion scores from the Maudsley Personality Inventory, thus failing to support Eysenck's theory.—*B. J. House.*

2450. Maltzman, Irving; Seymore, Simon, & Licht, Leonard. (U. California, Los Angeles) **Verbal conditioning of common and uncommon word associations.** *Psychol. Rep.*, 1962, 10(2), 363-369.—A list of 100 stimulus words from the Kent-Rosanoff list was presented to 93 undergraduates, instructed to give associations quickly. One group, reinforced by the word "Good" after each common association, produced significantly more common responses than did a control group given no reinforcements, but the effect was restricted to Ss able to verbalize the reinforcement contingency. A 3rd group, reinforced for uncommon associations, did not differ from the controls. The 3 groups did not differ in performance on Guilford's Unusual Uses Test presented after the word-list.—*B. J. House.*

2451. Marder, Martin. (U. Pennsylvania) The effects of experimenter attractiveness and negative reinforcement on verbal conditioning. *Dissert. Abstr.*, 1961, 22(4), 1243.—*Abstract*.

2452. Morone, Von G., & Citroni, M., (U. Pavia, Italy) Über die Möglichkeit den photomotorischen Reflex der Pupille hervorzurufen. [On the possibility of eliciting the photomotor reflex of the pupil.] *Ophthalmologica*, 1962, 143(6), 423-430.—"The authors endeavor to condition the photomotor reflex of the pupil by using an auditory stimulus. The researches, pupillographically conducted, do not allow any conditioned iridic reflex activity to be brought into evidence. With the method used, instead, dynamic pupillary manifestations were induced which could be the expression of an atypical, arrhythmical hippus."—C. T. Morgan.

2453. Shearn, Donald W. (Colorado Coll.) Operant conditioning of heart rate. *Science*, 1962, 137(Whole No. 3529), 530-531.—Delay of shock was made contingent upon acceleration of heart rate in human Ss. The number of accelerations rose across sessions for these Ss and fell for their yoked-controls who received equal amount of noncontingent shock. A shorter delay produced more accelerations but faster adaptation. Interpretation of changes in heart rate is confounded by related respiratory changes.—*Journal abstract*.

2454. Shearn, Donald Walter, Jr. (Indiana U.) Operant conditioning of heart rate. *Dissert. Abstr.*, 1962, 22(5), 1726-1727.—*Abstract*.

2455. Simmons, W. L., & Christy, E. G. (U. Nevada) Verbal reinforcement of a TAT theme. *J. proj. Tech.*, 1962, 26(3), 337-341.—Attempts to reinforce a parent-child interaction theme appeared to be more successful with female Ss, although there were few significant differences between experimental and controls groups.—A. Greenwald.

2456. Staats, A. W., Staats, C. K., & Crawford, H. L. (Arizona State U.) First-order conditioning of meaning and the parallel conditioning of a GSR. *J. gen. Psychol.*, 1962, 67, 159-167.—A GSR was conditioned to the word "large, as it was presented in a list of words to the Ss, using shock and noise as UCS. Subsequent to this conditioning procedure, the evaluative meaning of "large" was measured using an appropriate semantic differential scale. Negative evaluative meaning had been conditioned to "large." Thus, the same procedure which conditioned a GSR to a word also conditioned negative evaluative meaning to the word. It was found, in addition, that the intensity of the conditioned GSR was significantly correlated with the intensity of the conditioned meaning response. The results support the theory that word meaning consists of responses which are classically conditioned to a word through systematically pairing it with certain aspects of the environment.—*Author abstract*.

2457. Taber, Julian Ingersoll (U. Pittsburgh) Human timing behavior. *Dissert. Abstr.*, 1961, 22(3), 928.—*Abstract*.

2458. Timmons, Edwin O. (Station B, VA Hosp., Gulfport, Miss.) Weakening verbal behavior: A comparison of four methods. *J. gen. Psychol.*, 1962, 67, 155-158.—A comparison was made of the relative efficiency of 4 methods of weakening a conditioned verbal habit—extinction, "punishment,"

counter-conditioning, and "punishment" plus counter-conditioning. Ss were college undergraduates. It was hypothesized that methods involving greater amounts of cue-change from conditioning to the weakening phase would have correspondingly greater effects. The results supported this prediction. Counter-conditioning (conditioning a similar but incompatible response) was the most powerful single weakening agent. Relatively little was added by combining punishment with counter-conditioning. Punishment alone was approximately one-half as effective as counter-conditioning, and straight extinction less effective than counter-conditioning by a factor of 3 to 1.—*Author abstract*.

Discrimination

2459. Geer, James H., & Buss, Arnold H. (U. Pittsburgh) Supplementary report: Generalization of a nonverbal response to aggressive verbal stimuli. *J. exp. Psychol.*, 1962, 63(4), 413-414.—A previous study investigated the effects of direction of generalization and intensity of vocal response on stimulus generalization with aggressive verbal stimuli. The present study attempted to test the generality of these findings with a nonverbal response and with an amplitude measure of response strength. The tendency to match the intensity of the response with the intensity of the hostile stimuli, as well as the direction of generalization were compared with findings from the earlier study.—*J. Arbit.*

2460. Gundy, Richard F. (Indiana U.) Detection of an unspecified signal: A study in auditory discrimination learning. *Dissert. Abstr.*, 1961, 22(6), 2077.—*Abstract*.

2461. Smock, C. D., & Small, V. H. (Purdue U.) Efficiency of utilization of visual information as a function of induced muscular tension. *Percept. mot. Skills*, 1962, 14(1), 39-44.—36 Ss were each presented with visual forms for .02 sec. under 6 levels of induced muscle tension (IMT). Analysis of data indicated a curvilinear relationship between IMT and recognition. An interaction between trials and tension suggested that perceptual efficiency varied as a function of the stage of perceptual learning. An increase in consistency of the difficulty level of the forms across trials was interpreted as supportive of this interpretation. It was concluded that peripheral-motor processes have an important role in regulating perceptual inputs.—W. H. Guertin.

2462. Thomas, David R., & Mitchell, Kevin. (Kent State U.) Instructions and stimulus categorizing in a measure of stimulus generalization. *J. exp. Anal. Behav.*, 1962, 5(3), 375-381.—3 groups of Ss were exposed to a light of a given color and then viewed a random sequence of wavelengths with instructions to respond only to the original color. However, the instructions were worded differently to vary the strength of the set-to-discriminate. All 3 groups produced similar gradients which indicated that the task was such that a strong discriminatory set was produced regardless of the wording of the instructions. A temporal analysis of the gradients indicated that the peak of responding shifted to the primary color. A 2nd experiment was run to test this hypothesis and was supported by the data. It was suggested that, although a physiological process could not be ruled out, the verbal labeling of the standard stimulus value may have been responsible

for the regression of the gradient toward the primary color.—*J. Arbit.*

2463. Tyler, Vernon O., Jr. (U. Nebraska) **Sensory integration with and without reinforcement.** *J. exp. Psychol.*, 1962, 63(4), 381-386.—Ss pointed to the letters of nonsense words and described them in a way that made certain that the names of the letters were not uttered vocally or subvocally—ruling out the S-R and R-R interpretations of the data. Later, tachistoscopic duration thresholds were obtained for the nonsense words and equated control words. Thresholds were lower for the previously exposed words; this was interpreted as evidence of S-S learning. Ss who were praised during the training did no better on the tachistoscope thresholds than an unpraised group; this was interpreted as indicating that S-S learning is independent of reinforcement.—*J. Arbit.*

Verbal Learning

2464. Beck, Robert C., Phillips, William R., & Bloodsworth, Warren D. (Wake Forest Coll.) **Associative reaction times as a function of association value of nonsense syllable stimuli.** *Psychol. Rep.*, 1962, 10(2), 517-518.—Reaction times of associations of 18 students to 320 nonsense syllables correlated significantly ($r = -.19$) with Archer's association values.—*B. J. House.*

2465. Besch, Norma F., Thompson, Venan E., & Wetzel, Allan B. (Ohio State U.) **Studies in associative interference.** *J. exp. Psychol.*, 1962, 63(4), 342-352.—Using female college Ss, 3 experiments were performed in order to evaluate a generalization interpretation of interference in transfer tasks employing 1 and 2 syllable nouns and adjectives. The findings could not be accounted for solely on the basis of the generalization interpretation. An alternative explanation in terms of extinction or unlearning was proposed.—*J. Arbit.*

2466. Bugelski, B. R. (U. Buffalo) **Presentation time, total time, and mediation in paired-associate learning.** *J. exp. Psychol.*, 1962, 63(4), 409-412.—College Ss learned pairs of nonsense syllables where the presentation time for the response syllable varied from group to group (as did, therefore, the total exposure time). Fastest learning occurred with the longest presentation times. Presentation time multiplied by trials produced no significant differences, and it was concluded that this is a constant value. Questioning Ss revealed that mediational devices had been used in learning the nonsense syllable pairs; this had occurred particularly when the pairs were translated onto 1 or 2 meaningful words, or where the pairs produced some particular imagery.—*J. Arbit.*

2467. Cieutat, V. J. (Louisiana State U.) **Induced meaningfulness in serial verbal learning.** *Percept. mot. Skills*, 1962, 14(3), 373-374.—An attempt was made to increase meaningfulness (m) of initially low m terms by experimentally raising the number of associations elicited by them. It is concluded that this facilitates the rate at which these terms are subsequently learned in a serial list. Results are inconclusive, however, as part or all of the observed effect may have been due to familiarity incidental to the association-adding procedure.—*W. H. Guertin.*

2468. Cieutat, V. J. (Louisiana State U.) **Stability of meaningfulness (m) values for verbal material.** *Percept. mot. Skills*, 1962, 14(3), 398.—Noble's m was shown to demonstrate high stability and generality as an index of the relative associative power of Verbal items. Surprisingly similar rank positions were found for m 's of the words evaluated 10 years ago by Noble, although the present study employed friends and relatives of college students, while Noble used airmen.—*W. H. Guertin.*

2469. Cieutat, V. J. (Louisiana State U.) **Replication report: Implicit verbal chaining in paired-associate learning.** *Percept. mot. Skills*, 1962, 14(1), 45-46.—An experiment by Russell and Storms (1955) was replicated and extended, using a group method of paired-associate learning. Their conclusion, that implicit verbal chaining facilitates paired-associate learning, was confirmed. It was also suggested that magnitude of this facilitation is inversely proportional to the number of implied mediating links.—*W. H. Guertin.*

2470. Epstein, William (U. Kansas) **Backward association as a function of meaningfulness.** *J. gen. Psychol.*, 1962, 67, 11-20.—Stimulus-recall following S-R learning of pairs of concrete nouns, abstract nouns, and function words was investigated. R-S learning was highest for the concrete nouns (high Noble's m) and lowest for the function words (low Noble's m). R-S learning was intermediate for the abstract nouns (intermediate m). 4 possible explanations of the relationship between m and R-S learning were described.—*Author abstract.*

2471. Erlebacher, Adrienne, & Harris, Chester W. (U. Wisconsin) **Parameters of word fluency tasks.** *J. educ. Psychol.*, 1962, 53(4), 197-200.—Word fluency tests, consisting of a given initial pair of letters (bigram) which are to be responded to by writing all the English words the S can in a 5-minute period, were administered to 90 adult Ss. Bigrams were chosen to form an orthogonal design on the basis of 2 characters: (a) either a vowel followed by a consonant, or a consonant followed by a vowel; and (b) pool size, or the number of commonly used English words which begin with that bigram. Both effects were significant at the .01 level. The consistency of these results with other studies of verbal learning is commented on.—*Journal abstract.*

2472. Ernst, Ronald Lester. (U. Wisconsin) **The effect of intralist similarity on the identification-discrimination learning of nonsense syllables.** *Dissert. Abstr.*, 1961, 22(6), 2075.—*Abstract.*

2473. Fischer, Gloria J., & Cook, Mary B. (U. Oklahoma) **Influence of distribution of practice and varying speeds of stimulus presentation on incidental learning.** *Psychol. Rep.*, 1962, 10(2), 539-545.—1 group of 112 undergraduates was instructed to learn a list of 7 nonsense syllables while another group of 112 was instructed merely to observe. Each syllable was enclosed in a different form. In each group, Ss were assigned (in a 2×2 design) to a syllable presentation interval of 2 or 4 sec. and an intertrial interval of 6 or 126 sec. For the instructed group, longer presentation time and intertrial interval significantly increased rate of syllable learning. Effectiveness of the longer presentation time was greater for a 6 sec. intertrial interval than the 126 sec. interval. Incidental learning measured by a recognition test of the forms was signifi-

cantly less for the instructed group than for the uninstructed group and was significantly greater for 4 sec. presentation time than 2 sec. Intertrial interval had no effect on incidental learning.—*B. J. House.*

2474. Fletcher, Samuel J. (Florida State U.) The effect of single verbal stimuli and combinations of verbal stimuli on omission of a class of words or sentences. *Dissert. Abstr.*, 1961, 22(4), 1251.—*Abstract.*

2477. Jensen, Arthur R. (U. California) Is the serial-position curve invariant? *Brit. J. Psychol.*, 1962, 53(2), 159-166.—"An index of Relative Difficulty was proposed as a method of representing the serial-position effect. It has the advantages of not being confounded with the other components and of being the same shape whether it is based on errors or on correct responses. It results on what might be called a "pure" serial-position curve and permits the direct comparison of serial-position curves obtained under various conditions. The Index is recommended as the only satisfactory method for comparing different serial-position curves."—*C. T. Morgan.*

2478. Johnson, Ronald C., & Watson, Nancy. (U. Hawaii) Individual meaning production as related to amount of verbal learning. *J. gen. Psychol.*, 1962, 67, 117-120.—Contemporary research suggests that Ss who produce large numbers of meanings (in Noble's sense) or associations to words, should learn verbal materials more rapidly than do Ss who produce fewer meanings or associations. Several studies, using nonsense materials as stimuli, have yielded essentially negative results. The Es in this study used a sample of 41 Ss who took part in a meaning production and a learning task. Stimulus materials in both segments of the experiment consisted of meaningful words, since these stimuli should maximize individual differences in the production of associations as well as in associative probability in the learning task. A significant positive correlation was found between the number of associations produced by Ss and the amount Ss learned. Possible explanations of this finding were discussed.—*Author abstract.*

2479. Kausler, Donald H., & Trapp, E. Philip. (St. Louis U.) Effects of incentive-set and task variables on relevant and irrelevant learning in serial verbal learning. *Psychol. Rep.*, 1962, 10(2), 451-457.—"Eighty college students were assigned to eight groups of 10 Ss each, representing a $2 \times 2 \times 2$ factorial design. The factors were motivational level (no incentive-set versus incentive-set), position of irrelevant cues with respect to relevant cues (central versus peripheral), and rate of presentation (2 sec. versus 4 sec.). The relevant task consisted of a serial list of eight nonsense syllables and the irrelevant task of two-digit numbers exposed simultaneously on the memory drum. Twelve trials were given each S with instructions that directed attention to the relevant task only." The only significant main

effect was faster relevant learning with a 4-sec. rate than a 2-sec. rate. Significant interactions indicated a complex relationship between incentive-set, position of irrelevant cues, and relevant and irrelevant learning. "The results were interpreted as due to variations in relevant cue distinctiveness that accompany simultaneous irrelevant learning."—*B. J. House.*

2480. Lerea, L., & Kohut, S. (Northern Illinois U.) A comparative study of monolinguals and bilinguals in a verbal task performance. *J. clin. Psychol.*, 1961, 17(1), 49-52.—30 monolingual and 30 bilingual Ss were administered a 70-minute battery consisting of the following items: bilingualism questionnaire, Columbia Mental Maturity Scale, Rogers' Test of Personality Adjustment, and Micro Utterance-Association Test (MU-A). The findings suggested that bilinguals learned and relearned the MU-A faster than monolinguals, and the speed of learning of the monolinguals showed a high correlation with their intelligence. There was no significant relationship in either the bilingual or monolingual group between social adjustment and the MU-A performance.—*V. J. Bielouskas.*

2481. Noble, Clyde E. (Montana State U.) Reply to comments on the measurement of CVC trigrams. *Psychol. Rep.*, 1962, 10(2), 547-550.—"Archer's criticisms [see *Psychol. Rep.*, 1961, 9, 679-680] of my CVC measurement technique are judged invalid, and my belief that association-value scales are inferior to scales of meaningfulness still seems to be correct on further reflection. Although Saltz and Ager's (see 37: 404) suggestion of a universal learning-score transformation does not appear feasible, they were justified in doubting the linearity of m and m' . The true relationship, based on more extensive new data reported here, is probably exponential. This is a finding, however, which provides no evidence against the statistical properties attributed to the two scales."—*B. J. House.*

2482. Peterson, Lloyd R., Saltzman, Dorothy; Hillner, Kenneth, & Land, Vera. (Indiana U.) Recency and frequency in paired-associate learning. *J. exp. Psychol.*, 1962, 63(4), 396-403.—Using college students, the formation of associations between pairs of verbal items was investigated in 4 short-term retention experiments. The same phenomena were essentially found in short-term retention that had previously been found in long-term learning and retention studies. Findings were discussed in relation to the all-or-none vs. incremental assumption regarding associative learning, and they were interpreted as favoring the latter assumption.—*J. Arbib.*

2483. Sassenrath, Julius M. (Indiana U.) Transfer of learning without awareness. *Psychol. Rep.*, 1962, 10(2), 411-420.—2 groups of 36 undergraduates each, assigned to Control and learning without awareness (LWA) training conditions, were further subdivided into Informed and Not Informed Groups for transfer tests in a 2×2 design. In training and transfer tasks all Ss were required to give number responses to stimulus words, with correct response determined by number of letters in the word. LWA Ss were trained to criterion, while Control Ss performed the training task without knowledge of results. LWA Ss were excluded for partial verbalization of the reinforcement principle. All Ss were reinforced for correct responses during the transfer task, but Informed Ss were told the

general nature of the principle while Not Informed Ss were not. Learning of the transfer task was significantly faster for the LWA than the Control Group, and for the Informed vs. Not Informed Groups. It was concluded that LWA can influence acquisition of a transfer task.—B. J. House.

2484. Terwilliger, Robert F. (Rutgers U.) **Note on familiarity and verbal learning.** *Psychol. Rep.*, 1962, 10(2), 409-410.—Familiarity ratings of trigrams by 50 undergraduates were significantly correlated with learning data presented by Underwood and Schulz (see 35: 3113). Partial rs showed both familiarity and pronunciability to be independent predictors of learning speed. Use of frequency of occurrence as a measure of familiarity is criticized.—B. J. House.

2485. Wark, David Mayer. (U. Minnesota) **Longitudinal study of verbal learning in the stimulus equivalence and response equivalence paradigms.** *Dissert. Abstr.*, 1961, 22(6), 2084-2085.—Abstract.

Reinforcement (Including Probability Learning)

2487. Brownstein, Aaron Joseph. (U. Missouri) **The effects of reinforcement magnitude on non-differentially reinforced choice behavior.** *Dissert. Abstr.*, 1961, 22(5), 1721.—Abstract.

2488. Cieutat, Victor J. (Louisiana State U. New Orleans) **Sex differences and reinforcement in the conditioning and extinction of conversational behavior.** *Psychol. Rep.*, 1962, 10(2), 467-474.—"Sixteen groups of four Ss each were used to investigate effects of sex of Ss, sex of E, non-verbal positive and negative reinforcement, and time, in the conditioning and extinction of amount of time spoken in a free-responding conversational situation." Positive and negative reinforcement were defined as E's attending to or ignoring S, respectively, when S spoke. Positive reinforcement was effective in producing an increase in quantity of conversation which lasted beyond withdrawal of the reinforcing agent. Reinforcement was more effective when administered by persons of the same sex as the individuals being reinforced.—B. J. House.

2489. Gerstein, Alvin I. (U. Rochester) **The effect of reinforcement schedules on meaning generalization and on awareness of the purpose of the experiment.** *J. Pers.*, 1961, 29(3), 350-362.—141 student Ss were presented with a series of nonsense syllable-meaningful word pairs. "One syllable was paired with words having an unpleasant connotation, and another . . . with words having a pleasant connotation. Transfer of meaning was measured by S's rating of the syllables upon a seven-point scale ranging from pleasant to unpleasant. The degree of awareness was determined from S's responses to several non-specific questions at the end of the testing procedures." Conclusion: transfer of meaning increases as a function of both continuous and partial reinforcement, but only in Ss expressing awareness of the relationship between the word pairs. (15 ref.)—G. T. Lodge.

2490. Little, Kenneth B., Brackbill, Yvonne, & Kassel, Stephen H. (U. Denver) **A test of a general utility theory model for probability learning.** *J. exp. Psychol.*, 1962, 63(4), 404-408.—80 6th grade children were required to predict the occurrence of alphabetical letters on 400 consecutive trials. There were 3 experimental conditions: the relative frequency of the most frequently appearing letter, the number of choices available, and the even or uneven division in frequency of occurrence of the less frequently appearing letters. The results were discussed in terms of a utility theory model derived from Siegel.—J. Arbit.

2491. Mandler, George; Preven, David W., & Kuhlman, Clementina K. (U. Toronto) **Effects of operant reinforcement on the GSR.** *J. exp. Anal. Behav.*, 1962, 5(3), 317-321.—"Each of nine college students was run for 11 daily sessions. Except for the first (operant level) and last two (extinction) sessions, 500-ohm drops in skin resistance were followed by reinforcement (light). These reinforcement periods lasted 20 min and were preceded by 10-min control periods during which no reinforcement was administered. Although the results showed no evidence for operant conditioning of the GSR, they did indicate that increased emission of GSR's occurred during the reinforcement period. This effect was shown to hold for Ss with low operant levels of GSR's but not for Ss with high operant levels."—J. Arbit.

2492. Portnoy, Maurice. (New York U.) **Conditioning of verbal behavior and its effect upon meaning: An experimental study of positive and negative reinforcement applied to word associations of varying strengths and its consequent effects upon meaning.** *Dissert. Abstr.*, 1962, 22(12), 4411-4412.—Abstract.

2493. Revusky, Samuel H. (VA Hosp., Northampton, Mass.) **Mathematical analysis of the durations of reinforced inter-response times during variable interval reinforcement.** *Psychometrika*, 1962, 27(3), 307-314.—In a free-responding situation in which reinforcements are scheduled by a variable interval program, the durations of reinforced inter-response times are shown to be a function of the durations of all inter-response produced by S and of the frequency of reinforcement.—Journal abstract.

2494. Taylor, Robert E. (U. Tennessee) **Extinction following qualitative change in the reinforcing stimulus.** *Dissert. Abstr.*, 1961, 22(3), 929.—Abstract.

Learning Theory

2495. Dinnerstein, D., & Egeth, H. (Rutgers U.) **On the development of associations.** *Psychol. Beitr.*, 1962, 6(3-4), 544-552.—Evidence for the gradual associative learning thesis is offered. A repetition of Estes' experiment with modified material indicates that the formation of an association is the development of a small trace structure within a larger one. The concept of intraserial interference is discussed, and some questions requiring further experimentation are indicated. (French & German summaries)—H. J. Priester.

2496. Flood, Merrill M. (U. Michigan) **Stochastic learning theory applied to choice experiments with rats, dogs, and men.** *Behav. Sci.*, 1962, 7(3), 289-314.—Discusses stochastic learning models

with particular emphasis upon symmetry models. Presents an analysis of synthetic data and of rats in a learning problem to show that the symmetry model is practical and satisfactory. The methods are then applied to an analysis of dog avoidance data (Solomon & Wynne, 1953), rat avoidance data (Theios, 1961) and human binary choice learning data. (22 ref.)—*J. Arbit.*

2497. Simon, Herbert A. (Carnegie Inst. Technology, England) **A theory of the serial position effect.** *Brit. J. Psychol.*, 1962, 53(3), 307-320.—The paper proposes a theory of the well-known serial position effect that makes quantitative predictions, acceptable by nonparametric tests, of the observed amount of bowing of the serial position curve. The theory, which stems from viewing the central nervous system as an information-processing system, is compared with the Lepley-Hull hypothesis and Atkinson's theory of the serial phenomena, and is shown to be more satisfactory than the older explanations.—*Journal abstract.*

RETENTION & FORGETTING

2498. Asch, Solomon E., & Ebenholtz, Sheldon M. (Swarthmore Coll.) **The process of free recall: Evidence for non-associative factors in acquisition and retention.** *J. Psychol.*, 1962, 54(1), 3-31.—The assumption that consecutive recall is a function solely of specific associative connections between the data of past experience was subjected to examination. Acquisition and recall of lists of nonsense syllables were studied by the method of free recall. Order of recall was not substantially related to the order of initial experience. Significant levels of RI were obtained under these conditions; the effects cannot be referred to competition of responses, to unlearning, or more generally, to damage of the associative bond. The determinants of free recall (and of RI effects) were interpreted in terms of the process of availability, which was distinguished from that of association.—*Author abstract.*

2499. Doob, Leonard W. (Yale U.) **The effect upon recall of syntactical construction in German.** *J. soc. Psychol.*, 1962, 57(1), 133-141.—2 versions of a story were distributed randomly to 157 German-speaking students in the South Tyrol. The story contained 40 syntactical constructions which were experimentally manipulated in order to investigate the relation to recall of a characteristic of the German language to separate 2 words through intervening words: the verb separated from its auxiliary, the subject from its verb, the verb from its prefix, and the article from its noun. Recall was found not to be significantly affected by the constructions. Instead, Ss were inclined to recollect presumably more familiar synonyms. A comparison confined to the expressions employed in the experiment revealed tendencies to recall expressions that had been perceived and that were non-separated and familiar.—*Author abstract.*

2500. King, D. J., & Yu, K. C. (American U.) **The effect of reducing the variability of length of written recalls on the rank order scale values of the recalls.** *Psychol. Rec.*, 1962, 12, 39-44.—"Two sets of fifteen recalls of two stories were selected so that they exhibited small amounts of variability in length. These two sets of recalls were scaled for accuracy of recall by the method of rank order. Factor analytic treatment of the intercorrelations of seven

accuracy of recall measures resulted in a two factor solution for both sets of recalls. Regression analysis indicated, as might be predicted, that the scaled scores were more influenced by nonlength than by length factors although even under these length restrictive conditions length of recalls still influenced judgments of accuracy of recall."—*R. J. Seidel.*

2501. Korn, James H., & Jahnke, John C. (Miami U.) **Recall and recognition as measures of immediate memory.** *Psychol. Rep.*, 1962, 10(2), 381-382.—"Using both a measure of recall and one of recognition, immediate memory spans for digits, consonants, high- (HAS), and low-association value nonsense syllables (LAS) were determined for 48 college students in a balanced Latin square design. The measure of recognition was associated with greater immediate retention than was the measure of recall. For either response measure, retention was a function of the class of material to be retained. A comparison of the nonsense materials showed that HAS were recalled better than LAS."—*B. J. House.*

2502. Nicks, T. Leon, Jr. (Boston U.) **The relationship between the leveling-sharpening principle of cognitive control and retroactive inhibition.** *Dissert. Abstr.*, 1961, 22(3), 917-918.—*Abstract.*

2503. Postman, Leo. (U. California) **The temporal course of proactive inhibition for serial lists.** *J. exp. Psychol.*, 1962, 63(4), 361-369.—Retention was tested by relearning after intervals of 30 sec., 30 min., and 7 days in college students who learned either 3 successive lists and were tested for recall of the 3rd, or learned and recalled a single list. The lists varied in the frequency of the words employed. Significant increases were found in the amount of PI as a function of time for both kinds of materials. This is consistent with the hypothesis that the growth of PI from extraexperimental sources is responsible for much of long-term forgetting.—*J. Arbit.*

2504. Yntema, Douwe B., & Mueser, Gayle E. (Massachusetts Inst. Technology) **Keeping track of variables that have few or many states.** *J. exp. Psychol.*, 1962, 63(4), 391-395.—Air Force officers and enlisted men were read messages as to the states of various variables. Occasionally these messages were interrupted and S was asked to recall the last message about a particular variable. Such conditions as the number of variables involved, the number of states each variable might assume, and the probability that a given message would change the state of a variable were varied. In no case did the number of alternative states have any significant effect on the fraction of the questions answered correctly, provided the fraction correct was adjusted for chance success. The probability of change was found to have a large effect.—*J. Arbit.*

2505. Zinchenko, P. I. (Kharkov State U., USSR) **Neproizvol'noe zapominanie.** [Involuntary memorization.] Moscow, USSR: RSFSR Academy Pedagogical Sciences, 1961. 563 p.—After discussing the history of the "problem of involuntary and voluntary memorization" in the Soviet Union and abroad, the author presents the results of research on (a) involuntary memorization in relation to activity, purposefulness, and motivation and (b) involuntary versus voluntary memorization of various types of textual material under a variety of conditions. The author closes with a discussion of the "development

and training of the processes of memorization."—*I. D. London.*

THINKING

2506. **Festinger, Leon.** **Cognitive dissonance.** *Scient. American*, 1962, 207(4), 93-107.—The theory of cognitive dissonance centers around the idea that if a person knows various things that are not psychologically consistent with one another, he will, in a variety of ways, try to make them more consistent. The remainder of the article is devoted to a discussion of 3 examples of dissonance: the effects of making a decision, of lying, and of temptation. The examples show the kinds of dissonance-reduction effects that are obtained under special circumstances.—*L. A. Wauck.*

2507. **Hunter, Ian M. L.** (Edinburgh U., England) **An exceptional talent for calculative thinking.** *Brit. J. Psychol.*, 1962, 53(3), 243-258.—This study explores the highly exceptional "lightning calculation" of a distinguished mathematician who has considerable understanding of his own calculative thinking. Each calculation is a temporally co-ordinated, rapidly flexible onleading which is both unitary and complex. Biographically, it derives from prolonged and intensive practice fostered by circumstances in his upbringing and made possible by a large cognitive capacity which also manifests itself in other forms of intellectual achievement. During calculation, there are "leaps" of varying compass; there is also notable absence of sensory-type awareness. Ongoing proceeds through apprehending multiple attributes of the presented problem, deciding on some convenient and often ingenious calculative plan, and rhythmically implementing this plan while carrying through opportunistic telescoping and verifying of the ongoing activity.—*Journal abstract.*

2508. **Ramul', K. A.** (Tortuskii U.) **Psikhologiya myshleniya i problema vospitaniya myshliniya.** [The psychology of thinking and the training of thinking.] *Vop. Psikhol.*, 1962, No. 1, 45-52.—While traditional logic helps us check the correctness of our thinking, there is no logic or other aid for inventive or creative thinking. The following 7 general rules are suggested for helping children learn to think creatively: Don't hurry with the solution of problems. Ascertain all the information necessary to solve the problem. Preserve flexibility of thinking. Avoid negative transfer from one problem to another. Avoid functional fixedness. Realize that the solution of many modern problems requires a large fund of technical knowledge. Realize that in some cases solutions are found accidentally. Examples of problems are given where these rules may be helpful.—*H. Pick.*

Problem Solving

2509. **Arana, L., & Sokolov, E. N.** (Moscow State U., USSR) **Stokhasticheskaia teoriia vospriiatii. Soobshchenie VI. Otsenka éffektivnosti vospriiatii na osnove analiza traektorii dvizheniia pri osiazanii.** [The stochastic theory of perception. Communication VI. Effectiveness of perception evaluated by analyzing the trajectory of tactile movement.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1962, No. 2, 61-64.—Ss were asked to identify by touch 6 capital letters of the Russian alphabet formed with checkers. Probability of occurrence was the same. The purpose was to find the basic cells which yield the maximum

information in tracing the letters. Ss were guided by a "subjective system of hypotheses" in examining, eliminating, or following certain solutions. A tendency was noticed for the subjective system of hypotheses to approximate the objective system of hypotheses actually used during the experiment.—*A. Cuk.*

2510. **Laughery, K. R., & Gregg, I. W.** (IBM) **Simulation of human problem-solving behavior.** *Psychometrika*, 1962, 27(3), 265-282.—In the simulation of human behavior on a digital computer, one first attempts to discover the manner in which Ss internally represent the environment and the rules that they employ for action upon this representation. The interaction between the rules and the environmental representation over a period of time constitutes a set of processes. Processes can be expressed as flow charts which, in turn, are stated formally in terms of a computer program. The program serves as a theory which is tested by executing the program on a computer and comparing the machine's performance with S's behavior.—*Journal abstract.*

2511. **Lénárd, Ferenc.** **A problémamegoldás fáziskapcsolatai.** [Phase connections in problem solving.] *Pszichol. Tanulmányok*, 1958, 1, 57-69.—Puzzles were given to undergraduate students and they were asked to "think aloud" during the process of solving them. 9 phases are distinguished and described: stating of facts, modification of the problem, proposition of solution, criticism, following side-tracks, wondering (pleasing), irritation, doubt, abandoning the task. Frequency tables show the order in which each phase preceded or followed each other. Russian & English summaries.—*E. Friedman.*

2513. **Robertson, D. G., & Ammons, R. B.** **"Problem" norms for the Standard Anagram Task.** *Proc. Mont. Acad. Sci.*, 1962, 21, 97-104.—"Highly reliable solution frequency norms for the Standard Anagram Task were obtained for six basic letter combinations, based on solutions given by 80 Ss. . . . There was an appreciable correlation between frequency with which a solution was given and frequency of use of the solution as a word in everyday language. It was concluded that this task should be useful for studying certain basic questions about problem solving."—*C. H. Ammons.*

Concepts

2514. **Carlson, Earl R.** (Long Beach State Coll.) **Generality of order of concept attainment.** *Psychol. Rep.*, 1962, 10(2), 375-380.—A concept formation test using Heidebreder's technique and stimuli was administered to 5 groups (N = 77) differing in age, education, and background: early adolescents, adults, art students, Chinese students, and college students. The same order of difficulty—object, form, and number—was found for each group. A significant Concept x Groups interaction was discussed in relation to possible effects of personal factors.—*B. J. House.*

2515. **Feldman, Solomon E.** (Indiana U.) **Responses to ambiguous "concept classes" as a function of frequency of association during learning.** *Dissert. Abst.*, 1961, 22(5), 1722-1723.—*Abstract.*

2516. Harrow, Martin. (Indiana U.) Factors involved in the facilitative effects of learning reversal shifts. *Dissert. Abstr.*, 1961, 22(6), 2078.—*Abstract.*

2517. Huttenlocher, Janelle. (Harvard U.) Effects of manipulation of attributes on efficiency of concept formation. *Psychol. Rep.*, 1962, 10(2), 503-509.—30 7th-grade boys were tested on a series of concept formation problems requiring S to select the correct block of a set with relevant dimensions of form and brightness. $\frac{1}{2}$ the Ss (Group M) were allowed to manipulate the blocks to construct instances for test. Correct instances were indicated by light and buzzer, incorrect instances by nothing. Each S of Group M had a matched S in Group NM who was presented with the same sequences of instances (as constructed by the Group M S) but was not allowed to manipulate the blocks. Group NM performed significantly better than Group M. It was surmised that planning of manipulative responses distracted Group M Ss from the task of remembering and interpreting material previously presented.—*B. J. House.*

2518. Sechrest, Lee, & Wallace, John. (Northwestern U.) Assimilation and utilization of information in concept attainment under varying conditions of information presentation. *J. educ. Psychol.*, 1962, 53(4), 157-164.—Concept attainment by 151 Ss was studied under 4 conditions of information transmission equated in value: (a) initial positive instance, (b) initial positive instance plus list of possible hypotheses remaining, (c) initial positive instance plus list of hypotheses eliminated, and (d) initial positive instance and exposure to array comprised only of positive instances of possible remaining hypotheses. The task was attainment of a single 2-attribute concept by means of free selection from an array completely visible to S. Results indicated: (a) groups did not differ in number of instances required for solution or in relevance of 1st verbalized hypotheses; (b) inefficient performance was not attributable to failure of information assimilation, but Ss did not utilize all available information; (c) Conditions III and IV resulted in a significantly greater number of redundant hypotheses.—*Journal abstract.*

2519. Wolfgang, A., Pishkin, V., & Lundy, R. M. (VA Hosp., Tomah, Wis.) Anxiety and misinformation feedback in concept identification. *Percept. mot. Skills*, 1962, 14(1), 135-143.—Increases in the degree of misinformation had a progressively negative influence upon concept learning. Also misinformation feedback retarded concept performance more as task complexity increased, as indicated by the significant misinformation feedback and complexity interaction. Performance was significantly inhibited as a function of systematic increases in irrelevant information or task complexity. In general, the results show that anxiety has no appreciable effect on the degree to which misinformation feedback and task complexity affect learning in concept identification problems. DECISION & INFORMATION THEORY

2520. Ackoff, R. L. (Ed.) (Case Inst. Technology) Scientific method: Optimizing applied research decisions. New York: Wiley, 1962. xii, 464 p. \$10.25.—Analytical techniques for deriving numerical optimizing values of controlled variables in

abstract symbolic decision models are discussed. That justification of such values is largely intuitive is recognized by the authors. Procedures for minimizing expected cost of error are compared.—*K. J. Hartman.*

2521. Bartoshuk, Alexander K. (Brown U.) Response decrement with repeated elicitation of human neonatal cardiac acceleration to sound. *J. comp. physiol. Psychol.*, 1962, 55(1), 9-13.—Heart rate was measured before and after an 85-db. sound, 1 sec. in duration. 40 trials were given to each of 120 neonates (1-4 days of age), with interstimulus intervals of 15, 30, or 60 sec. Acceleration was noted on all trials, and was greater in older Ss. Response decrement appeared across trials, and was not related to age, sex, or interstimulus interval. It is concluded that the decrement is not due to neural fatigue, but may be an indicator of the habituation of arousal; the results suggest that the tonic arousal reaction habituates more readily than the phasic one.—*W. A. Wilson, Jr.*

2522. Berlyne, D. E. (Boston U.) Uncertainty and epistemic curiosity. *Brit. J. Psychol.*, 1962, 53(1), 27-34.—2 experiments were concerned with the effects of uncertainty on epistemic curiosity. Quotations, each coupled with the names of possible authors and with a distribution of fictitious experts' guesses regarding the true author, formed the experimental material. The role of uncertainty was predicted from a theory according to which epistemic curiosity will increase with degree of conceptual conflict. The 2 experiments showed reported curiosity to increase with 2 determinants of uncertainty and degree of conflict, namely (a) number of alternative responses and (b) evenness of distribution of response-strength, respectively. They also revealed ways in which response uncertainties, dependent on distributions of Ss' guesses, differ from the corresponding stimulus uncertainties.—*Author abstract.*

2523. Blackman, Sheldon. (Ireland Army Hosp., Fort Knox, Ky.) Some factors affecting the perception of events as chance determined. *J. Psychol.*, 1962, 54(1), 197-202.—180 Ss were exposed to series of red and green lights appearing with equal frequency. It was found that sequence length and the number of sequences significantly affect the number of red responses in extinction. The results appear to be understandable on the basis of a skill orientation developing on the part of Ss who received long sequences, or sequences readily perceived as patterned and a chance orientation developing on the part of Ss who received short sequence or nonpatterned sequences.—*S. Blackman.*

2524. Bodrov, V. A., Genkin A. A., & Zarakovskii, G. M. (Leningrad, USSR) Nekotorye zakonomernosti reaktsii cheloveka na testovye zadachi, modeliruiushchie priniatie odnogo iz dvukh vozmozhnykh reshenii: Soobshchenie I. Zavisimost' chastoty poiavleniia oshibok ot slozhnosti signalov i veroiatnosti ikh poiavleniia. [Human reaction to test problems involving choice between two possible solutions: Communication I. Frequency of errors as a function of the complexity and the probability of signals.] *Dokl. Akad. Pedagog. Nauk RSFSR*, 1961, No. 5, 77-80.—15 male Ss (age 19-33) were asked to decide as fast as possible whether or not a number was divisible by 3. RT and errors were recorded. Probability of occurrence of a number divisible by 3 was $\frac{1}{3}$. It was pointed out that errors

depend upon the length of numbers and upon the nature of the previous answers.—*A. Cuk.*

Pp. 361-371.—Besides the usually understood conditioned and unconditioned reflexes, there exist reflexes which manifest themselves as an alteration in the functional state of the receptors, their centers, etc.—the so-called "tuning" reflexes. Conditioned tuning reflexes were observed in the visual analyzer in man for microintervals of time. One eye was illuminated by a brief stimulus of given intensity, duration, and area. Alterations of excitability in response to adequate visual stimuli of various durations were observed at selected intervals (in msec.) by means of an optic adequometer designed by the author. Conditioned reflexes were observed as changes in the electroencephalogram arising in response to short exposure of the visual analyzer to light. After a number of combinations with light, a puff of air caused a change in the EEG analogous to that observed in response to a visual stimulus.—*I. D. London.*

Pisa, Italy) Higher nervous activity in cats with midpontine pretectal transections. *Science*, 1962, 137(Whole No. 3524), 126-127.—In cats with midpontine pretectal transections, orientation reflexes to visual stimuli consist only of vertical eye movements, pupillary dilation, and electroencephalographic arousal. Extinction of the orientation reflex by repetition of the photic stimulus is easily obtained; the reflex partially recovers after a few minutes of rest. By using as reinforcement stimulation of hypothalamus producing pupillary di-

lation and EEG arousal, conditioned responses to a visual stimulus may be obtained. The cat with mid-pontine pretrigeminal transection can be used as convenient preparation for the study of orientation and conditioned reflexes.—*Journal abstract.*

2546. Ebner, Ford F., & Myers, Ronald E. (Johns Hopkins School Medicine) Direct and transcallosal induction of touch memories in the monkey. *Science*, 1962, 138(Whole No. 3536), 51-52.—A monkey, after corpus callosum transection, will fail to recall through one hand tactual tasks that he has learned through the other hand. However, if a monkey has already learned a task through one hand, destruction of the corpus callosum does not greatly affect his subsequent recall of that task through the other hand. It is concluded that task learning through one hand develops separate memory trace systems in both hemispheres.—*Journal abstract.*

2547. Kling, Arthur. (Michael Reese Hosp., Chicago, Ill.) Amygdalectomy in the kitten. *Science*, 1962, 137(Whole No. 3528), 429-430.—Kittens sustaining bilateral amygdalectomy failed to show behavioral changes seen in the adult after subsection to similar lesions. No growth deficits or hypopituitarism occurred in the kittens. A certain level of neuroendocrine maturation may be necessary for the effects of amygdalectomy to be manifested.—*Journal abstract.*

2548. Kusama, Toshio; Kojima, Tokuzo, & Ootani, Katsumi. (U. Tokyo) An experimental study on autonomic functions in the mesencephalon and pons of rabbits. *Folia psychiat. neurol. Jap.*, 1961, 15(4), 336-370.—Electrolytic lesions were produced unilaterally in 50 rabbits. An increase of behavioral excitability followed lesions in the lateral central gray at the caudal mesencephalic level. Gastric bleeding, a fall in body temperature, a decrease in urine chloride, and glycosuria followed lesions in other circumscribed areas.—*W. A. Wilson, Jr.*

2549. Migler, Martin. (U. Pittsburgh) The effects of fornix lesions on emotional and timing behavior in the rhesus monkey. *Dissert. Abstr.*, 1961, 22(3), 925.—*Abstract.*

2550. Mishkin, Mortimer; Prockop, Elinor S., & Rosvold, H. Enger. (National Inst. Mental Health) One-trial object-discrimination learning in monkeys with frontal lesions. *J. comp. physiol. Psychol.*, 1962, 55(2), 178-181.—Frontal, inferotemporal, and unoperated monkeys were tested on a series of one-trial learning problems involving delayed matching or nonmatching from baited or unbaited samples. All animals tended to choose the new object on the test trial, regardless of their pretrial experience. When this response was correct, frontals performed at a high level; otherwise, they performed poorly. "The analysis suggests that frontal lesions produce abnormal difficulty in suppressing whatever response normally prevails in a given situation." *W. A. Wilson, Jr.*

2551. Pogorelova, P. M. (Herzen Pedagogical Inst., Leningrad) Vliianie pererezki zadnikh stolbov spinnogo mozga na dvigatel'nye pishchevye uslovnye refleksy u sobak. [Effect of the cutting of posterior columns of the spinal cord on the motor alimentary CR in dogs.] *Zh. vyssh. nervn. Deiatel.*, 1961, 11(6), 1089-1093.—The following motor CRs in response to acoustic and to tactile stimuli were

elaborated in 3 dogs: seizing a ring with the teeth, moving a fore and a hind leg. When the spinal cord was cut at the level of the first cervical vertebra, the jaw reflex remained unchanged whereas the limb reflexes disappeared and could be reestablished only within a period from 5 to 11 months. The behavior reactions of the dogs to verbal commands did not change in the least.—*A. Cuk.*

2552. Oakley, Bruce, & Pfaffmann, Carl (Brown U.) Electrophysiologically monitored lesions in the gustatory thalamic relay of the albino rat. *J. comp. physiol. Psychol.*, 1962, 55(2), 155-160.—Lesions were placed in the medial extension of the nucleus ventralis of the rat thalamus, in sites of electrical response to taste stimulation of the tongue. On 2-bottle tests, operated rats showed a significant elevation of the rejection threshold for quinine, and a reduction in intake of normally-preferred concentrations of sucrose and sodium chloride solutions.—*W. A. Wilson, Jr.*

2553. Ratner, Stanley C. (Michigan State U.) Conditioning of decerebrate worms, *Lumbricus terrestris*. *J. comp. physiol. Psychol.*, 1962, 55(2), 174-177.—Conditioning, to a vibratory CS, of a withdrawal response elicited by a light US was studied in 2 groups of decerebrate earthworms. Imposition of a long delay in the apparatus before training did not affect the subsequent course of conditioning. The failure of worms to show CRs when trials are spaced was confirmed, and was explained in terms of the reduction in URs during spaced training.—*W. A. Wilson, Jr.*

BRAIN STIMULATION

2554. Carrea, Raul, & Lanari, Alfredo. (U. Nacional Buenos Aires, Argentina) Chronic effect of tetanus toxin applied locally to the cerebral cortex of the dog. *Science*, 1962, 137(Whole No. 3527), 342-343.—Tetanus toxin injected into the cortex produces convulsion, neurological disability, and a strychnine-like discharging focus, appearing after a minimal latency of 2 days and lasting more than a month. Such a focus, apparently caused by a blockade of inhibitory synapses, does not demonstrate any major damage in microscopic studies.—*Journal abstract.*

2555. Fox, Stephen S., & O'Brien, James H. (U. Michigan) Inhibition and facilitation of afferent information by the caudate nucleus. *Science*, 1962, 137(Whole No. 3528), 423-424.—Stimulation of the caudate nucleus modifies inputs to the visual system of the cat. The modification of such sensory information is similar to the modification seen on stimulation of the thalamus and brain stem reticular formation. Preliminary stimulation of the caudate nucleus at different intervals prior to the afferent input may have facilitatory or inhibitory effects on both evoked potentials and unitary responses of the visual cortex.—*Journal abstract.*

Central Stimulation

2556. Albino, R. C., & Lucas, J. W. (U. Natal, Durban, South Africa) Mutual facilitation of self-rewarding regions within the limbic system. *J. comp. physiol. Psychol.*, 1962, 55(2), 182-185.—In each of 4 rats, an electrode was implanted in the septal region, and another was placed elsewhere in the brain. When response to a bar produced a

stimulus from both electrodes, 2 of the rats pressed at a rate greater than the sum of their rates for stimulation of the 2 points separately. The 2nd electrodes of these animals were in the substantia nigra, and between the reticular substance and the red nucleus, respectively. It is suggested that the limbic system has positive feedback mechanisms.—*W. A. Wilson, Jr.*

2557. Boyd, E. S., & Gardner, L. C. (U. Rochester) **Positive and negative reinforcement from intracranial stimulation of a teleost.** *Science*, 1962, 136(Whole No. 3516), 648-649.—Tests in which an animal receives or avoids direct electrical stimulation of its brain according to its position in the tank as well as tests of free operant behavior demonstrate the existence of both positively and negatively rewarding areas in the brain of the goldfish.—*Journal abstract.*

2558. Deutsch, J. A., & Howarth, C. I. (Stanford U.) **Evocation by fear of a habit learned for electrical stimulation of the brain.** *Science*, 1962, 136(Whole No. 3521), 1057-1058.—Rats were trained to press a lever for electrical stimulation of the brain. After extinction of the habit, fear-producing stimuli (a buzzer or electrical shock to the feet) recalled the rat to the lever, although its lever pressing on these occasions never produced further intracranial stimulation. Operant levels of the lever-pressing habit were also greatly increased for long periods following the fear-producing stimuli. The phenomenon is most striking in rats trained with tegmental electrodes and is almost completely absent in rats trained with electrodes in the hypothalamus. This suggests that electrical self-stimulation in some sites may be caused by an activation of mechanisms underlying normal fear and escape.—*Journal abstract.*

2559. Entet, Noble Dewey. (U. Houston) **Differential behavioral effects of emotional facilitation from central and peripheral stimulation.** *Dissert. Abstr.*, 1961, 22(3), 912.—Abstract.

2560. Hodos, William, & Valenstein, Elliot S. (Walter Reed Army Inst. Research, Washington, D. C.) **An evaluation of response rate as a measure of rewarding intracranial stimulation.** *J. comp. physiol. Psychol.*, 1962, 55(1), 80-84.—Rats were provided with 2 levers, which led to stimulation in the septal and posterior hypothalamic areas, respectively. Choices of the area of stimulation were measured at various levels of intensity. Independent measures of response rate showed that relative rate is not an accurate index of preference. Within a single area, a higher intensity was always preferred, even when the rate of self-stimulation at the higher intensity was less than the rate at the lower intensity.—*W. A. Wilson, Jr.*

2561. Howarth, C. I., & Deutsch, J. A. (Stanford U.) **Drive decay: The cause of fast "extinction" of habits learned from brain stimulation.** *Science*, 1962, 137(Whole No. 3523), 35-36.—According to Deutsch's theory of intracranial self-stimulation, cessation of responding after the withdrawal of the stimulus should be a simple function of time without stimulation. To test this prediction, the lever was withdrawn from a Skinner box for varying times, then replaced and normal extinction completed. The number of extinction trials was a simple function of the time the lever was out of the box, thus confirming Deutsch's hypothesis that cessation of responding in this instance is due to a decay of a

motivational excitation produced by the electrical stimulation, and not a function of the number of unreinforced trials as in normal extinction.—*Journal abstract.*

2562. Ikeda, Terutika. (Tottori U. School Medicine, Japan) **Effect of stimulation of the amygdaloid complex upon conditioned avoidance.** *Folia psychiat. neurol. Jap.*, 1961, 15(3), 157-174.—Electrical stimulation of points in the amygdala and hippocampus of cats caused temporary loss of conditioned avoidance responses, an inhibitory effect which appeared to be maintained during the period of after-discharge. In an alternation avoidance situation, some electrode placements led to facilitation of response. It is concluded that stimulation of the amygdala has inhibitory and facilitative influences upon the motivational systems of the hypothalamus.—*W. A. Wilson, Jr.*

2563. Lilly, J. S., & Miller, A. M. (Communication Research Inst., Miami, Fla.) **Operant conditioning of the bottlenose dolphin with electrical stimulation of the brain.** *J. comp. physiol. Psychol.*, 1962, 55(1), 73-79.—A technique is described for placing electrodes in the brain of the unanesthetized bottlenose dolphin, *Tursiops truncatus*. Illustrative results of stimulation in positively and negatively reinforced areas are given. It is concluded that, compared to the monkey, the "large brain of the dolphin thus affords: (a) faster learning, (b) greater control over reactions to stimulation of subcortical systems which are motivationally active, and (c) control and use of vocalizations to obtain 'rewards' and to stop 'punishments.'"—*W. A. Wilson, Jr.*

2564. Mogenson, G. J. (U. Saskatchewan) **Avoidance learning to aversive brain stimulation.** *Psychol. Rep.*, 1962, 10(2), 558.—Successful avoidance learning in a shuttle-box was found for 2 out of 3 rats showing strong fear reactions to intracranial stimulation (ICS). Several interpretations of the effect of ICS are discussed.—*B. J. House.*

2565. Nielson, Harold C., Knight, James M., & Porter, Paul B. (VA Hosp., Kansas City, Mo.) **Subcortical conditioning, generalization, and transfer.** *J. comp. physiol. Psychol.*, 1962, 55(2), 168-173.—Each of 25 cats was trained to respond to electrical stimulation of a subcortical structure in order to avoid shock, and then was tested for responsiveness to other stimuli. Of 22 structures investigated, at least 21 served adequately as sites of CS administration. Stimulus generalization was found between frequencies, but not between structures, except, possibly, to the mesencephalic reticulum.—*W. A. Wilson, Jr.*

2566. Novin, Donald. (Kungl. Veterinärhögskolan, Stockholm, Sweden) **The relation between electrical conductivity of brain tissue and thirst in the rat.** *J. comp. physiol. Psychol.*, 1962, 55(2), 145-154.—Electrodes were implanted in rats' brains in order to measure conductivity and thus obtain an estimate of extracellular electrolyte concentration. Changes in conductivity correlated significantly with amount of water intake in various situations involving water deprivation and consumption, eating of dry food, and injections of hypertonic saline. However, a saline injection caused more increase in concentration relative to water intake than did water deprivation. The possible influence upon water intake of

intracellular electrolytes and extracellular fluid volume is discussed.—*W. A. Wilson, Jr.*

2567. Roberts, Warren W. (Syracuse U.) Fear-like behavior elicited from dorsomedial thalamus of cat. *J. comp. physiol. Psychol.*, 1962, 55(2), 191-197.—A fear-like crouching response was elicited by stimulation of an area in n. medialis dorsalis in cats. The animals then learned to avoid stimulation of this area, leading to the conclusion that the crouching response is accompanied by an aversive drive, and the suggestion that this area forms part of the central mechanism of fear.—*W. A. Wilson, Jr.*

2568. Vaughan, Eva, & Fisher, Alan E. (U. Pittsburgh) Male sexual behavior induced by intracranial electrical stimulation. *Science*, 1962, 137(Whole No. 3533), 758-760.—Electrical brain stimulation in the anterior dorsolateral hypothalamus produced a marked increase in sexual capacity in some male rats. Several measures of sexual behavior, including the length of the postejaculatory refractory period, were significantly affected.—*Journal abstract.*

2569. von Holst, Erich. Electrically controlled behavior. *Scient. American*, 1962, 206(3), 50-60.—By energizing electrodes placed in various regions of a chicken's brain, the animal can be made to carry out most of the actions of its normal repertory. The technique clarifies the nature of drives. The organism comprises a bundle of drives which support one another or oppose one another to greater or lesser extent. "Spontaneous" activity is the result of a continual and shifting interplay of forces in the central nervous system.—*L. A. Wauck.*

Electroshock

ELECTROENCEPHALOGRAPHY

2570. Aladzhanova, N. A., & KoItsova, A. V. (Inst. Biophysics, Acad. Science, USSR) Chasovnye kachaniya elektricheskoi aktivnosti v strukturakh golovnoy mozga. [Temporal oscillations of electrical activity in cortical structures.] *Dokl. Akad. Nauk. SSSR*, 1962, 142(1), 241-244.—A description of a periodic arousal of excitation in various brain structures initiated by external stimulation. The cycles of excitation arise with a long latent period after the initial stimulus and develop during the course of several hours. The oscillating process decays in the 1st hour or 2, arises again in the 2nd or 3rd hour and again drops off after 3-4 hours. The excitation consists of super-slow waves with a period of 8-10 secs. and 1-1.5 minutes and is interpreted as being a manifestation of the general regulatory system of the cortex. Stimulation consisted of electric stimulation of 10 μ sec. durations at 4 volts. Typically the latent period for this response is in the terms of minutes. The different stages of the cyclic activity exhibit different electrical frequencies.—*H. Pick.*

2571. Bechtereva, N. P., & Zontov, V. V. (A. L. Polenov Neurosurgical Research Inst., Leningrad) The relationship between certain forms of potentials and the variations in brain excitability (based on EEG, recorded during photic stimuli triggered by rhythmic brain potentials). *EEG clin. Neurophysiol.*, 1962, 14, 320-330.—This study attacks the problem of correlating rhythmical brain waves, alpha, with the state of excitability of the brain. Findings were based upon the analysis of 161 EEG records

recorded from 67 persons with normal basal EEGs. While the results support the relationship of alpha potential phase and variations of excitability, the actual demonstration of this relationship did not agree with published reports. The relationship varied considerably in the same S as well as in different Ss. The results show that the time period of an alpha wave does not possess the exclusive property, attributed to it by some investigators, of being the single discrete unit of the nervous system.—*L. C. Johnson.*

2572. Brazier, Mary A., The analysis of brain waves. *Scient. American*, 1962, 206(6), 142-153.—For analyzing the electrical activity of the brain, the electronic computer has emerged as an instrument of great power and versatility. One of the principal uses of the computer is to extract meaningful signals from the background electrical noise generated by the brain. When the analyses are performed while the S is still connected to the recording apparatus, with the E able to manipulate the experimental variables, the computer becomes a subtle new tool for the studies of neurophysiology.—*L. A. Wauck.*

2573. DeLucchi, M. R., Garoutte, Bill, & Aird, Robert B. (U. California Medical Cent., San Francisco) The scalp as an electroencephalographic averager. *EEG clin. Neurophysiol.*, 1962, 14, 191-196.—The present study examined the relationships between scalp and cortical EEG activity in 29 cats, studying synchrony between the activity from these 2 levels wave by wave. High degrees of bilateral synchrony (72%) were obtained with scalp to scalp recording with lesser degrees with cortical electrodes. In the latter, the degree of synchrony was directly related to the number of electrodes used. Based on these observations, it was hypothesized that the scalp acts as an averager of electrical activity from underlying cortical activity and that 2 types of spontaneous activity were present. One was discrete and intrinsic to local cortical regions and the other was widely synchronized and presumably under the control of a subcortical pacemaker.—*L. C. Johnson.*

2574. Dustman, Robert E., Boswell, Reed S., & Porter, Paul B. (U. Utah) Beta brain waves as an index of alertness. *Science*, 1962, 137(Whole No. 3529), 533-534.—Reaction times of human Ss are reliably shorter when the signal to respond is given during spontaneous low voltage, fast (beta) brain waves than they are when the signal is given during spontaneous alpha waves. The mean difference of 12 milliseconds is, however, trivial in comparison to the advantage to be expected from forewarning.—*Journal abstract.*

2575. Estrin, Thelma (U. California, Los Angeles) A conversion system for neuroelectric data. *EEG clin. Neurophysiol.*, 1962, 14, 414-416.—A data processing system characterized by great versatility in the processing of neuroelectric data is briefly described. Technical specifications and cost are presented.—*Author abstract.*

2576. Golubeva, E. A. (Inst. Psychology, RSFSR Acad. Pedagogical Sciences) Ob $\mathbf{\bar{e}}$ lektroentsefalograficheskom vyrazhenii raboty bol'shikh polusharii golovnoy mozga pri vospriyatii svetovykh kompleksov. [The EEG characteristics of the brain cortex under conditions of perception of complex light stimuli.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1962, No. 1, 105-108.—EEGs of 14 Ss were recorded when Ss were exposed to complex visual stimuli of

flickering light (frequency between 20-30 cycles) and expected to analyze the stimuli under different instructions. The main result was that the left and the right cerebral hemispheres learned the rhythm in different ways depending upon the arrangement of the stimuli in the visual field.—*A. Cuk.*

2577. Gonik, Uri. (U. Houston) Differential amygdala and posterior hypothalamic EEG correlates of conditioning in unrestrained cats. *Dissert. Abstr.*, 1961, 22(6), 2075-2076.—*Abstract.*

2578. Kalinin, P. I., & Sokolova, A. A. (USSR Acad. Sciences, Moscow) *Elektricheskaia aktivnost' retikulinoi formatsii srednego moga krolika v usloviakh sozdaniia v kore bol'shikh polusharii dominantnogo ochaga.* [Electrical activity of the midbrain reticular formation of the rabbit in the presence of a dominant focus in the cerebral cortex.] *Zh. vyssh. nervn. Deiatel.*, 1961, 1(6), 1112-1119.—Electrodes were implanted into different parts of the brain of 6 rabbits (sensorimotor zone, optic zone, and reticular formation). EEG was recorded under conditions of visual and auditory stimulation. It was found that a dominant focus is reinforced by an indifferent stimulus only when this stimulus evokes in the EEG a distinct reaction of activation. A stimulus to which the reaction of activation has been previously extinguished either evokes no movement at all or a weak and unsteady one. It is concluded that the reinforcement of a dominant focus is closely bound up with influence exerted by the RF of the midbrain.—*A. Cuk.*

2579. Kaneko, Ziro; Hidaka, Yasuhiko; Hishikawa, Yasuo; Shimizu, Akira, & Miyazaki, Kiyoshi. (Osaka U. Medical School, Japan) Effect of arousal stimulation upon photic driving in the cat. *Folia psychiat. neurol. Jap.*, 1961, 15(3), 206-217.—Cortical photic driving induced by flicker was studied in unanesthetized cats. Auditory or tactile stimuli (or reticular formation electrical stimulation) inhibited low frequency responses, but facilitated high frequency response. Arousal stimuli often facilitated the second harmonic of the driving response, and caused reappearance of the driving even in deep anesthesia.—*W. A. Wilson, Jr.*

2580. Mirzoiants, N. S. (Inst. Pediatrics, USSR Acad. Medical Sciences, Moscow) *Izmenenie bioelektricheskoi aktivnosti mozga u detei rannego vozrasta v otvet na ritmicheskuu svetovuiu stimulatsiiu.* [Changes of the bioelectrical activity of the brain of infants in response to a rhythmical photic stimulation.] *Zh. vyssh. nervn. Deiatel.*, 1961, 11(6), 1005-1011.—This longitudinal study was done on 40 normal children from 14 to 350 days. Their EEG was taken while they were awake and exposed to a rhythmical flash of light. 3 characteristic changes in the EEG were observed: (a) a rapid establishment of rhythm, (b) a gradual forming of rhythm, and (c) arrhythmic changes in the curve of the EEG. The last phenomenon is the most typical.—*A. Cuk.*

2581. Mulholland, Thomas, & Runnals, Sylvia. (VA Hosp., Bedford, Mass.) A stimulus-brain feedback system for evaluation of alertness. *J. Psychol.*, 1962, 54(1), 69-83.—A bio-electronic feedback loop for evaluating brain alertness and the effects of "attention" produced a contingency between the occurrence of the electroencephalographic "alpha" rhythm and the occurrence of a stimulus. The behavior of the system permitted a sensitive index of

"habituation," internal attention states, and permitted a specification of degree of alerting. An interpretation of system behavior is offered with technical details and further applications described.—*Author abstract.*

2582. Pendleton, Ralph Brian. (U. Utah) Latency of cortical and subcortical conditioned responses in the cat as a function of dominant cortical frequency. *Dissert. Abstr.*, 1961, 22(5), 1726.—*Abstract.*

2583. Perez-Borja, Carlos; Chatrian, Gian Emilio; Tyce, Francis A., & Rivers, Morris H. (Rochester State Hosp., Minn.) Electrographic patterns of the occipital lobe in man: A topographic study based on use of implanted electrodes. *EEG clin. Neurophysiol.*, 1962, 14, 171-182.—To determine the topographic distribution of electrographic patterns recorded from deep in the occipital lobe, 31 implanted leads with 167 electrodes were implanted in 26 patients. Occipital patterns were found to form 2 groups: 1, a widely distributed group extending beyond occipital lobe to parietal and temporal areas and 2, a group recorded from discrete areas of the occipital lobe in or near the calcarine region. The former group includes the alpha and fast activity, the latter the slow on and off response and fast discharge to single and repetitive flashes of light.—*L. C. Johnson.*

2584. Sheveleva, V. S. (Inst. Evolutionary Physiology I. M. Sechenov, Acad. Science, USSR) *Razvitie "spontannoi" bioelektricheskoi aktivnosti rablichnykh otdelov nervnoi sistem y v ontogeneze.* [Development of "spontaneous" bioelectrical activity of various parts of the nervous system in ontogenesis.] *Dokl. Akad. Nauk SSSR*, 1962, 142(1), 249-252.—Rabbits were used to investigate the occurrence and development of electrical activity in the thalamus, hypothalamus, cerebellum, and sympathetic ganglia. Experiments were carried out on non-anesthetized animals from the 1st day of birth to the 2nd or 3rd year. Results obtained from platinum electrode recordings from the various areas indicate that there is bioelectric activity in all areas from the 1st day of life. For the 1st 3 or 4 days the activity is about the same in all the areas—high in frequency (up to 100 cps) but small in amplitude (1-15 uv.). After this differential activity starts, first in the cerebellum where the amplitude increases to 25-30 uv. The differential activity is described as it occurs in the various parts of the nervous system. It is noted that in the first days of postnatal life, periodic bursts of activity in the sympathetic system are followed by peaks of excitation all through the central nervous system.—*H. Pick.*

2585. Sickel, W. *Über das menschliche Elektroenzephalogramm nach mehrstündiger psychischer Aktivität.* [Human encephalograms after prolonged mental activity.] *Arch. ges. Psychol.*, 1962, 114(1), 1-54.—Comparisons are reported of alterations in encephalograms after 6 hours of predominately mental activity and after 6 hours of predominately physical activity for 90 Ss. Mental activity was followed by heavier alterations in the encephalograms. Effects of diurnal cycles and individual differences are discussed.—*K. J. Hartman.*

2586. Steiner, William G. (U. Illinois) Electrical activity of rat brain as a correlate of primary drive. *EEG clin. Neurophysiol.*, 1962, 14, 233-243.—The aims of the present study were to demonstrate in

33 male albino rats that changes in CNS electrical activity occur as a consequence of a strong appetitive drive (thirst), to attempt a crude specification of their locus, and to ascertain whether these EEG changes are in the predicted direction of asynchrony. While there were the predicted changes in the electrical activity accompanying changes in the drive level, the EEG changes which accompanied a given condition were found to be dependent upon the brain placement under consideration and the particular frequency being recorded.—*L. C. Johnson.*

2588. Villablanca, Jaime. (U. Chile) Electroencephalogram in the permanently isolated fore-brain of the cat. *Science*, 1962, 138 (Whole No. 3536), 44-45.—The cerebral cortex of cats with chronic or permanent mesencephalic transections of the brain stem showed both high-voltage, slow-wave synchronized electroencephalographic patterns and low-voltage, fast-wave desynchronized rhythms when studied postoperatively. The alternation of sleep and wakefulness electrical activity in the permanently isolated forebrain is contrasted with the observations of Bremer in the acute "cerveau isole" preparation.—*Journal abstract.*

EVOKED POTENTIALS

2589. Jane, John A., Smirnov, George D., & Jasper, Herbert H. (McGill U., Montreal) Effects of distraction upon simultaneous auditory and visual evoked potentials. *EEG clin. Neurophysiol.*, 1962, 14, 344-358.—To study the effect of changes in alertness, distraction, and direction of attention upon electrical evoked potentials recorded from specific sensory pathways of the brain, bipolar recording electrodes were implanted subdurally in 5 cats. The electrodes were over the primary visual and auditory cortical areas. A stroboscopic flash was used for light stimulus and a click for auditory stimulus. Stimuli for visual distraction was a rat and for auditory distraction a tape recording of squeaking noise of a rat was used. Effects of distraction are of a very complex nature, depending on the past experience of the animal, its immediate state of alertness, and reaction to distracting stimuli. Evoked potentials to simultaneous visual and auditory test stimuli are highly variable in the unanesthetized cat at rest, and marked changes occur at both geniculate and cortical levels during distraction.—*L. C. Johnson.*

2590. Karimova, M. M. (Chair of Higher Nervous Activity, Moscow State U., USSR) Izbiratel'nost' ugasheniia orientirovochnogo refleksa na zvukovye razdrzhiteli u sobak pri estestvennom i nembutalovom sne. [Selectivity of the extinction of the orienting reflex to acoustic stimuli in natural and nembutal sleep.] *Zh. vyssh. nervn. Deiatel.*, 1961, 1(6), 1065-1073.—Electrodes were implanted into different parts of the brain (optic and motor zones, brain stem, reticular formation) of 3 dogs. The orienting reflex was measured by the movement of the external ear and by respiration. EEG was also recorded. It was found that the ascending activating reticular system does not play any essential role in the selective extinction of the orienting reflex. The "nervous model of the stimulus" is formed in the cor-

tical structures with the participation of the specific conducting pathways.—*A. Cuk.*

2591. Marsh, James T., Worden, F. G., & Hicks, L. (U. California, Los Angeles) Some effects of room acoustics on evoked auditory potentials. *Science*, 1962, 137 (Whole No. 3526), 280-282.—Auditory potentials were recorded from bipolar electrodes chronically implanted in the cochlear nuclei of 4 cats. In a training box modified to reduce echoes these animals were exposed to clicks and tone pulses presented from an overhead speaker. Slight changes in the position of the animal in the resulting sound field produced marked changes in the potentials evoked from the cochlear nucleus. These phenomena were observed in the unanesthetized, unrestrained Ss as well as in those under Nembutal anesthesia. It is suggested that these acoustic effects complicate the analysis and interpretation of potentials evoked from the cochlear nucleus under conditions of habituation, shifts in attention, and learning.—*Journal abstract.*

SENSORY PHYSIOLOGY

2592. Biersdorf, William R., & Armington, John C. (Walter Reed Army Inst. Research) The effects of chromatic pre-exposure upon dark adaptation of the human electroretinogram. *J. comp. physiol. Psychol.*, 1962, 55(2), 161-167.—Spectral sensitivity of the ERG was studied during the first 2 min. of dark adaptation after pre-exposure to colors of high luminance. The sensitivity increased more rapidly to 500 mμ than to test flashes from other parts of the spectrum. The positive wave of the ERG was analyzed into 2 peaks, neither of which represented solely photopic or scotopic activity; a 3rd (principally photopic) component is suggested by the data.—*W. A. Wilson, Jr.*

2593. Francois, J., & De Rouck, A. Étude électro-retinographique de l'oeil humain enuclée. [Electro-retinographic study of the enucleated human eye.] *Ophthalmologica*, 1962, 144(2), 126-140.—"After enucleation of the eyeball, three stages can be distinguished in the evolution of the E.R.G. The first stage, which has a maximal duration of 6 minutes, is characterized by the presence of the following components: a wave, b wave, c wave, slow negative deflection and d wave or off-effect. . . . The second stage is characterized by the disappearance of the b and c waves. . . . The third stage is characterized by the slow negative deflection, which remains the last component of the E.R.G. and may persist over an hour."—*C. T. Morgan.*

2594. Mazokhin-Porshniakov, G. A. (Inst. Biological Physics, Moscow, USSR) O vzaimodeistvii raznykh priemnikov glaza v tsvetovom zrenii sverchka. [On the interaction of different receptors in color vision in the cricket.] *Biofizika*, 1962, 7(4), 442-448.—The cricket has color vision, mediated through only 2 receptors with different spectral sensitivities. The sensitivity-curve of the short-waved receptor (maximum about 510 mμ) is close to the absorption-curve of rhodopsin, while that of the 2nd (maximum between 560 and 570 mμ) is close to the absorption-curve of iodopsin. Interaction between the receptors is characterized by "partial mutual substitutability of the receptors." It consists of the "preservation of color equality for the eyes by compensation of insufficiency of excitation of one receptor

with heightened excitation of the other."—*I. D. London.*

2595. Peake, W. T., Goldstein, M. W., Jr., & Kiang, N. Y. S. (Massachusetts Inst. Technology) Responses of the auditory nerve to repetitive acoustic stimuli. *J. Acoust. Soc. Amer.*, 1962, 34 (5), 562-570.—"Auditory nerve responses to short bursts of acoustic noise have been recorded by gross electrodes. For moderate stimulus intensities the amplitude of the response is independent of burst repetition rate for rates below approximately 10/sec. The curve of response amplitude vs. rate then decreases except for a small "bump" in the curve near 600/sec. Synchronized responses were detected for repetition rates as high as 3000/sec by an average response computer. These data have been considered in terms of a model that accounts for the overlapping of the response waveforms. In terms of this model, the neural activity decreases monotonically with increasing rate above the rate 10/sec."—*A. M. Small, Jr.*

2596. Peake, W. T., Kiang, N. Y. S., & Goldstein, M. H., Jr. (Massachusetts Inst. Technology) Rate functions for auditory nerve responses to bursts of noise: Effect of changes in stimulus parameters. *J. Acoust. Soc. Amer.*, 1962, 34(5), 571-575.—"Rate functions for the amplitude of neural responses are presented as a function of stimulus parameters, such as burst length, intensity, and stimulus power level. The data show that the rate functions depend on all of these parameters in a manner that does not allow for a simple description. Rate functions are also reported for noise bursts in the presence of various levels of steady masking noise. Near visual detection level these rate functions exhibit characteristics that are well accounted for by a model that deals with the overlapping of successive neural responses."—*A. M. Small, Jr.*

2597. Tournay, Auguste. Le domaine du système proprioceptif avec, avant et après Sherrington. [The proprioceptive system before and since Sherrington.] *J. Psychol. norm. pathol.*, 1961, 58(2), 129-155.—A systematic consideration of the anatomical, physiological, clinical, and developmental aspects of proprioception. Sherrington's work is analyzed in detail, and in its historical setting. The author briefly discusses his own studies.—*M. L. Simmel.*

2598. Usov, V. V. (Polenov Research Neurosurgical Inst., Leningrad, USSR) Optimizatsiia kanala peredachi informatsii v protsesse adaptatsii zritel'nogo analizatora. [Optimization of the channel of information transmission in the process of adaptation of the visual analyzer.] *Biofizika*, 1962, 7(3), 328-332.—In the process of dark adaptation channel-optimization may be viewed as proceeding through the establishment of a quantum threshold corresponding to the most favorable conditions for receiving information. In the general case, that threshold is optimal which ensures the greatest difference in the probabilities for activating a receptor in the presence of its signal and in its absence.—*I. D. London.*

2599. Val'tsev, V. B. (Inst. Higher Nervous Activity & Neurophysiology, Moscow, USSR) Bioelektricheskaya aktivnost' setchatki izolirovannogo glaza liagushki v usloviakh odnovremennoi stimulatsii nepreryvnym i ritmicheskim svetom. [Bioelectric activeness of the retina of the isolated eye in the frog under conditions of simultaneous stimulation with continuous and rhythmic light.] *Biofizika*, 1962,

7(4), 433-441.—Data are presented indicating the "quantitative laws of retinal activity" resulting from simultaneous stimulation with continuous and rhythmic light.—*I. D. London.*

2603. Essman, Walter B. (Albert Einstein Coll. Medicine) Effects of an experimentally induced acute renal failure on a learned maze response in rats. *J. gen. Psychol.*, 1962, 67, 51-56.—In considering some of the relationships between physiological deficit and measurable behavior, an experimentally produced acute kidney failure was chemically effected in 8 Ss trained in a T maze. Response latencies and error scores were elevated as compared with 8 control Ss trained to the same criterion; this closely paralleled the physiological changes measured. After clinical recovery 2 weeks later, all Ss learned a similar maze response. It took longer for the experimental group to reach a successful response criterion. The data support the hypothesis that behavioral indices are measures which may be predictive of a physiological insult, such as acute renal failure.—*Author abstract.*

2604. Essman, Walter B. (Albert Einstein Coll. Medicine) The retroactive effect of an acute physiological stress on learning. *J. gen. Psychol.*, 1962, 67, 57-60.—In testing the hypothesis that a stress situation in the form of an interruption of the functional status of an organ system may have a retroactive effect upon behavior, a group of experimentally naive rats were subjected to chemically induced acute kidney failure. A matched control group

received chemically inert control treatment. 2 weeks following complete recovery from the physiological stress all Ss were trained and tested in a T maze. The greater response latencies and error frequencies of the experimental group indicated a retrograde decrement.—*Author abstract.*

2605. Essman, Walter B., & Sudak, Frederick N. (Albert Einstein Coll. Medicine) Sustained and temporary hypothermia as variables in successful maze learning. *Psychol. Rep.*, 1962, 10(2), 551-557.—In Experiment I, sustained hypothermia in mice ($N = 166$) was shown to impair escape learning in a 20° C water maze. Body temperature, ranging from 36° C to 38.9° C, was controlled by injection with saline or a thermolytic drug and by maintaining in a 33° C or 2.5° C environment before maze trials. In Experiment II, 42 mice, maintained at normal temperatures, were run with water-maze temperatures of 3° C, 13° C, 20° C, or 34° C. Groups did not differ in over-all performance level; all except the 34° C group showed significant improvement. "The suggestion that moderate sustained hypothermia interferes with the consolidation of experience . . . was considered. Implications of the present findings as far as hypothermia, motivational properties of water-escape, and temperature reduction in relation to other independent variables are discussed."—B. J. House.

2606. Gendlin, E. T., & Berlin, J. I. (U. Wisconsin) Galvanic skin response correlates of different modes of experiencing. *J. clin. Psychol.*, 1961, 17(1), 73-77.—In an attempt to produce in the laboratory a phenomenon observed in psychotherapy and theoretically formulated as "continuous reference to experiencing," 17 male and female college undergraduates previously not known to the E were given 7 tape recorded instructions, followed by a 2½-minute experimental period. The number of GSRs and resistance rise were measured and evaluated via analysis of variance. "Following the laboratory instructions for silent continuous reference to experiencing significantly fewer GSRs and greater resistance increase occurred, than during experimental periods that involved speech, or silent external or self-interrupted attention."—V. J. Bieliauskas.

2607. Greenberg, Michael, J., & Windsor, Donald A. (U. Illinois) Action of acetylcholine on bivalve hearts. *Science*, 1962, 137(Whole No. 3529), 534-535.—The isolated hearts of a comprehensive selection of bivalves were tested to determine the distribution of the excitator and depressor effects of acetylcholine. No broad relationships are obvious although some intrafamily uniformity of response exists. The hearts of most species were both excited and depressed, probably by separate actions of acetylcholine. From these data we can conclude that bivalve heart muscle conforms closely to other molluscan muscle in its pharmacological reactions to acetylcholine.—*Journal abstract.*

2608. Heller, J. (Charles U., Prague) The mechanism of conditioned reflex oliguria. [The influence of the nervous system on renal function.] *Physiol. Bohemoslov.*, 1962, 11(3), 186-191.—"Conditioned reflex oliguria was elaborated in response to nociceptive stimulation of the skin in dogs. It was not elaborated in adrenalectomized dogs with a functional block of the neurohypophysis and denervated kidney. Conditioned reflex oliguria can be induced in dogs in at least 3 ways: (a) by conditioned reflex

release of the antidiuretic hormone, (b) by conditioned renal vasoconstriction in response to a direct nervous stimulus, (c) by conditioned reflex release of adrenal hormone (or hormones) (probably adrenaline)."—C. T. Morgan.

2609. Heller, J. (Charles U., Prague) The significance of the adrenals and neurohypophysis in the mechanism of conditioned polyuria in the dog. *Physiol. Bohemoslov.*, 1962, 11(2), 113-118.—In 6 adrenalectomized dogs with ureteral fistulae and a denervated left kidney, it was found that conditioned water, osmotic and mercury diuresis were the same as in the controls. In 10 dogs it was found that no antidiuretic activity was present in the plasma (using a method sensitive to 1 microunit) in conditioned water and mercury diuresis. In conditioned osmotic diuresis, the antidiuretic activity of 1 ml. plasma ranged from 1.5 to 9.2 microunits. Since the composition and volume of the urine in conditioned water, osmotic and mercury diuresis were always the same, while the antidiuretic activity of the plasma varied, it seems that the neurohypophysis does not play an important role in the mechanism of different types of conditioned polyuria. It is assumed that conditioned polyuria is caused either by an unknown substance with a diuretic effect, or by an isolated increase in the blood flow in the kidney medulla.—*Author abstract.*

2610. Johnson, Walter H., Meek, Joseph C., & Graybiel, Ashton. The effects of unilateral and bilateral labyrinthectomy on canal sickness in the squirrel monkey. *USN Sch. Aviat. Med. NASA Jt. res. Rep.*, 1961, Proj. MR005.13-6001, Subtask 1, Rep. No. 65; NASA Order No. R-37. 10 p.—6 squirrel monkeys which readily developed canal sickness when exposed to slow rotation were divided into 2 groups and subjected either to a unilateral left labyrinthectomy or a bilateral labyrinthectomy. Following surgery both groups of animals demonstrated vestibular dysfunction in unsteadiness of gait and absence of response to caloric testing of the operated ears. After bilateral labyrinthectomy, all 3 monkeys developed a complete insensitivity to canal sickness. A similar lack of symptoms was seen initially in the monkeys subjected to unilateral labyrinthectomy; however, this behavior proved to be temporary, and by 6 months the animals had nearly returned to the presurgical level of sensitivity to canal sickness.—*USN SAM & NASA.*

2611. Khristosov, KH. (Dept. Psychiatry, Higher Medical Inst., Sophia) Popýtká fiziologicheskogo izucheniya estradnogo volneniya. [An attempt at a physiological study of stage fright.] *Vop. Psikh.*, 1962, No. 1, 143-147.—68 music students were Ss in this study which attempted to relate changes of pulse rate and blood pressure at the time of musical performances to experienced stage fright and type of nervous system. All Ss showed an increased pulse and blood pressure before going on stage. After the performance some Ss (13) showed further increase of blood pressure. Some (28) showed a decrease of blood pressure, and 8 showed no change. Pulse rate had increased after performance for 25 Ss, had decreased in 17, and showed no change in 1. The degree of stage fright appeared to depend on the significance of the performance (e.g., less fright was manifest when performing in front of one's own school mates), and on the experience of the performer, and on the type of nervous system of the

performer. Strong nervous system types displayed higher indices of stage fright than weak and average types.—*H. Pick.*

2621. Thiessen, D. D., Zolman, James F., & Rodgers, David A. (U. California, Berkeley) Relation between adrenal weight, brain cholinesterase activity, and hole-in-wall behavior of mice under different living conditions. *J. comp. physiol. Psychol.*, 1962, 55(2), 186-190.—Mice were housed either individually or in groups for 4 weeks with different amounts of environmental stimulation. Group-housed extra-stimulation animals showed the shortest running time on a hole-in-the-wall test, and the highest adrenal weight and subcortical cholinesterase activity. Adrenal weight, and cortical and subcortical activity, all correlated with the behavioral measure under most experimental conditions.—*W. A. Wilson, Jr.*

PSYCHOPHARMACOLOGY

2622. ———. *Acta neurol. psychiat. Belg.* 1961, 61(8), 669-788.—The whole issue has been devoted to a series of 21 articles reporting on the uses of dixyrazine (Esucos) dichlorhydrate 10-/2-methyl-3-(1-hydroxy-ethoxyethyl-4-piperazinyl) propyl/phenothiazine. The general trend of the findings is that the drug possesses a slight effect on the psychoses, particularly as a sedative. Favorable results have been obtained with neurotic conditions and certain types of depression. In relapses after interruption of the therapy, the action of the drug is considered slightly less favorable than some of the other drugs. Except for drowsiness with large doses, there are no

untoward side effects. The authors of these articles are: V. Bienfet, S. Levis, J. Dauby, and L. Beelen; J. Paquay, F. Arnould, P. Burton, M. Tinant, and E. Mottet; A. Benrubi; F. Lens; G. Noel and M. Scalais; Fouks; A. Segers and J. Nuyts; T. Bonaretto; J. Sévery; A. Wauters; R. Verspreuwen; L. Humbeek; W. Ballet; Rubbens; R. Kaivers; P. Jonas; F. De Loose; Hacquaert; A. Delmotte; and P. Goffart. (English summaries)—*V. Sanua*.

2623. Arora, R. B., Singh, M., & Kanta, Chandra. Tranquilizing activity of jatamansone: A sesquiterpene from *nardoostachys jatamansi*. *Life Sci.*, 1962, No. 6, 225-228.—"Four aggressive and hostile Rhesus monkeys between 2-4 kg were given jatamansone 100 mg/kg i.p. Five different patterns for scoring the behaviour of monkeys were studied. There was 75 per cent reduction in excitement, defensive and aggressive hostility; while sociability and contentment showed an increase of 80 per cent."—*C. T. Morgan*.

2624. Barry, Herbert, III, & Miller, Neal E. (U. Connecticut) Effects of drugs on approach-avoidance conflict tested repeatedly by means of a "telescope alley." *J. comp. physiol. Psychol.*, 1962, 55(2), 201-210.—Rats were run in an alley for food or water reward under various conditions of deprivation; changes in the length of the alley were associated with changes in the intensity of a shock delivered at the goal. Alcohol and amobarbital sodium decreased strength of approach but decreased avoidance even more; chlorpromazine, morphine, and stimulants decreased speed of approach on all trials without clearly reducing the strength of avoidance per se.—*W. A. Wilson, Jr.*

2625. Bindra, Dalbir, & Mendelson, Joseph. (McGill U., Canada) Interaction of habit strength and drug effects. *J. comp. physiol. Psychol.*, 1962, 55(2), 217-219.—Rats were trained to bar-press for water and were injected with chlorpromazine before some of the experimental sessions. Animals that were responding more before the drug continued to respond more under the drug, but the decrement in performance produced by the drug was greater the higher the previous performance. "It would appear that the negative interaction effects result from a fundamental feature of behavior relevant to all performance situations."—*W. A. Wilson, Jr.*

2626. Bujas, Z., Vidaček, S., & Vodanović, Mirjana. (Inst. za Medicinska Istraživanja, Zagreb) Djelovanje nekih farmakoloških sredstava na radni učinak kod tjelesnih radova koji se ponavljaju. [Effect of some drugs on work output in repetitive physical effort.] *Arh. Hig. rada*, 1960, 11, 261-287.—In the course of the last 5 years the authors have studied the effect of various drugs on physical work by using the method of repetitive physical effort both of a static (hanging on one's arms) and dynamic (treadmill) kind. The drugs used were: phenamine, ritoline, preludin, and veronal. It was found that: (a) The use of stimulants in the state of physical freshness and good motivation has hardly any positive effect. (b) The stimulants do not seem to be successful in submaximum efforts, even if such efforts produce a certain degree of fatigue. A certain positive effect of pharmacological stimulants appears to exist only in the final phase of maximum physical efforts. (c) The stimulants do not seem to slow down the process of restitution.

(d) Under the effect of stimulants, the Ss feel less tired. The differences in the feeling of pain suggest that the effect of stimulants is primarily central.—*B. Pets*.

2627. Caldwell, Lee S., & Evans, Wayne O. The effect of an analgesic agent on muscular work decrement. *USA Med. Res. Lab. Rep.*, 1962, No. 538. ii, 4 p.—Previous work has shown that a correlation exists between both the degree of ischemia and the intensity of pain with the strength of contraction in a tonically contracted muscle. Also, it has been demonstrated that the degree of muscle ischemia is related to the intensity of induced pain. These observations might lead to the conclusion that the pain caused by ischemia limits the endurance of the muscle contraction. An analgesic agent known to reduce ischemic pain was shown to have no effect on the endurance of a tonic muscle contraction. This was interpreted as demonstrating a lack of causality in the relationship between pain due to ischemia and muscular work decrement.—*USA MRL*.

2628. Carlton, Peter L. (Squibb Inst. Medical Research) Some behavioral effects of atropine and methyl atropine. *Psychol. Rep.*, 1962, 10(2), 579-589.—"Atropine (2.5-20.0 mg/kg), intraperitoneally administered to rats working in an operant shock-avoidance situation, increased shock-frequency and responding on a second, irrelevant lever in the response chamber without consistently altering the rate of avoidance responding. Equimolar doses of methyl atropine failed to produce the typical effects of atropine; this finding was taken as indicating that the observed effects of atropine were due to a block of the actions of acetylcholine in the central, rather than peripheral, nervous system. The results of a control experiment in which extra shocks, independent of avoidance responding, were given suggested that only a fraction of the increase in irrelevant responding following atropine was mediated by the concomitant increase in shock-frequency. The possibility of a central cholinergic system mediating the normal effects of non-reinforcement is discussed in relation to these and other data."—*B. J. House*.

2629.—Dureman, Ingmar. (Uppsala U., Sweden) Psych-Physiological methods applied to studies of effect of psychotropic drugs in man. *Rev. Psychol. appl.*, 1961, 11, 403-415.—The bulk of research on drug action affecting sensory processes has been concentrated on pain mechanisms, but there has been work on absolute visual thresholds, flicker fusion, visual movement after-effects, apparent movement thresholds, visual after-images, auditory thresholds, and time perception. Results are also cited as to the effects of the psychotropic drugs on both unconditioned and conditioned autonomic reactivity. It is highly desirable that the recent interest in practical application of such measurement techniques should also result in intensified basic research aimed toward better understanding of the principles of autonomic regulation. (53 ref.)—*W. W. Wattenberg*.

2630. Frommel, E., & Fleury, C. (Faculté de Médecine, Genève) De l'influence de l'amphétamine et de la cocaïne sur l'électrocrise expérimentale [The influence of amphetamine and cocaine on experimental electric seizures.] *Encephale*, 1961, 50(5), 512-515.—Results indicate that amphetamine and cocaine have opposing actions in the tonic phase of electroshock. In guinea pigs, amphetamine does

not modify the comatose phase. 2 mechanisms are proposed: (a) discharge of cerebral potentials under the influence of psychomotor agitation from amphetamine diminishes the grand mal seizures; (b) the sympathicotonic action of amphetamine neutralizes the vagotonia of the first phase of the seizure, thus modifying the symptoms. (18 ref.)—*W. W. Meissner.*

2631. Heimstra, N. W. (U. South Dakota). **Effects of amphetamine sulfate (Benzedrine) on the behavior of paired rats in a competitive situation.** *Psychol. Rec.*, 1962, 12, 25-34.—Doses of .5 mg/kg were given to submissive members (Group II) to dominant members (Group III), to both (Group IV) or to neither member (Group I). Pairs were determined by weight. 1. Social behavior increased significantly in Group IV during the drug trials. 2. Animals in Group II showed a marked, though not significant, decrease in fighting during the drug stage. 3. Administration of amphetamine sulfate had no significant effect on general activity or on food control. General activity showed a progressive decline during the trials while time spent in control of the food increased.—*R. J. Seidel.*

2632. Ivanova, V. I. (Moscow State U., USSR) **K mekhanizmu deistviia aminazina na pishchevye dvigatel'nye uslovnye refleksi ryb, golubei i krol'kov.** [Mechanism of the action of chlorpromazine on alimentary motor CR of fishes, pigeons and rabbits.] *Zh. vyssh. nervn. Deiatel.*, 1961, 11(6), 1120-1126.—Ss were 4 rabbits, 3 pigeons and 9 fish. In all Ss the administration of chlorpromazine resulted in a decline of the motor activity and suppression of the CR. The degrees of change depend upon the dose of the drug, type of animal, and individual peculiarities.—*A. Cuk.*

2633. Jacobsen, Erik. (A/S Meco-Dumex, Copenhagen, Denmark) **The clinical effect of drugs and their influence on animal behaviour.** *Rev. Psychol. appl.*, 1961, 11, 421-432.—Rational testing of the clinical effect of psychotropic drugs is impossible because mental disorders cannot be experimentally induced like infectious or metabolic diseases. However, studies can be made of behavior which may be interpreted as due to emotions which play a role in certain mental diseases. Studies of the effects of drugs on conditioned avoidance reactions indicate specific inhibition by all major tranquilizers. Some drugs appear to have a "taming" effect on animals; these also show a clinical effect on some acute anxiety states. Many psychotropic drugs have an ability to normalize conflict-induced behavior in animals. In all mental processes we presumably have at least 3 links: a provoking mechanism, a releasing mechanism, and an executive mechanism. This purely hypothetical construction may explain why it is possible to influence a psycho-neurosis with drugs having widely different effects in animal psychological experimentation. (35 ref.)—*W. W. Wattenberg.*

2634. Lader, M. H., & Montagu, J. D. (University Coll., London, England) **The psycho-galvanic reflex: A pharmacological study of the peripheral mechanism.** *J. Neurol. Neurosurg. Psychiat.*, 1962, 25(2), 126-133.—"Two series of experiments are reported in which the skin resistance and the pulse volume were simultaneously recorded from the same finger. In one series atropine was introduced into the finger by iontophoresis and the effects on psycho-

galvanic reflex and on vasoconstriction were studied. In the second series bretylium was introduced in a similar fashion in order to paralyze adrenergic nerve endings. Iontophoresis with saline was used as a control procedure. Atropine was found to abolish the psycho-galvanic reflex without affecting vasomotor activity. Bretylium abolished vasomotor activity without affecting the psycho-galvanic reflex. The results confirm the theory that the psychogalvanic reflex is solely dependent on pre-secretory activity in sweat glands."—*M. L. Simmel.*

2635. Laties, Victor G., & Weiss, Bernard. (Johns Hopkins U.) **Effects of alcohol on timing behavior.** *J. comp. physiol. Psychol.*, 1962, 55(1), 85-91.—Ethyl alcohol (.5 or 1.0 gm/kg) has generally little effect on the accuracy of timing behavior (a DRL schedule) in humans or in rats. With the larger dose some decreases in total responses were produced in both species, due primarily to an increase in the number of long pauses, but modal inter-response time was not changed.—*W. A. Wilson, Jr.*

2636. Lawton, M. Powell, & Cahn, Burton. (R.D. #2, Collegeville, Pa.) **A comparative study of the effects of listica and meprobamate upon motor functioning.** *J. Psychol.*, 1962, 54(1), 131-137.—A double blind study of the effects of hydroxyphenamate (listica) and meprobamate upon cancellation, digit symbol, speed of dotting, Purdue Pegboard performance, Porteus Maze performance, and hand steadiness was made, using paid prisoner volunteers as Ss. Analysis of both medication day scores and of placebo-medication difference scores failed to reveal any consistently positive or negative effect of either medication.—*Author abstract.*

2637. Linton, Harriet B., & Langs, Robert J. (New York U.) **Placebo reactions in a study of lysergic acid diethylamide (LSD-25).** *Arch. gen. Psychiat.*, 1962, 6(5), 369-383.—A 74-item questionnaire successfully differentiated 20 placebo from 30 LSD-25 Ss. "Strong placebo reactors are passive and poorly defended, comparatively insensitive, and unintellectual, with loose thinking and flattened affect. Weak placebo reactors tend to be sensitive to internal and external cues, self-examining and intellectually curious and to function well intellectually. Discussion of suggestibility, "the placebo situation," and "the placebo reactor." (26 ref.)—*L. W. Brandt.*

2638. Linton, Harriet B., & Langs, Robert J. (New York U.) **Subjective reactions to lysergic acid diethylamide (LSD-25): Measured by a questionnaire.** *Arch. gen. Psychiat.*, 1962, 6(5), 352-368.—Of 30 nonpsychotic male professional actors all of whom volunteered were given the MMPI, Rorschach, TAT, Wechsler-Bellevue, and a medical examination 30 received LSD-25 and 20 received placebo. Pretest-day, 4-test day, and posttest day responses to a 74-item questionnaire (included in text) are compared for both groups. Individual differences, S's reaction to the experimental situation, and psychoanalytic implications are discussed.—*L. W. Brandt.*

2639. Nowlis, Vincent. (U. Rochester, N. Y.) **Methods for studying mood changes produced by drugs.** *Rev. Psychol. appl.*, 1961, 11, 373-386.—There are complex technical and theoretical questions involved in the study of mood. Semantic explication of mood suggests the definition that mood is

the effect on a person of his own configurations of activity. A study of the literature indicates that a factor analytically standardized mood check list is already a technically superior instrument to most of those used in the study of self-concept. Mood refers to both the stream of behavior and to the vortices and forms which appear in that stream. It is in principle possible to coordinate statements about awareness with statements which include only behavioral, physiological, and environmental variables. In both the study of mood and in the study of non-specific drug effects we deal with a person and his total behavior and experience, and find that behavior and experience during the course of a research are dependent, in part, on the social situation, on the current psycho-physiological status, and current expectancies of the S, and on the complex social interactions which are developed during the course of the experiment. (46 ref.)—*W. W. Wattenberg.*

2640. Pfaff, Manfred. (Medizinische Poliklinik, Giessen, Germany) *Methodologische Überlegungen zur psychopharmakologischen Beeinflussung der Psychomotorik, der Psychosensorik, der Leistung und der Intelligenz.* [Methodological considerations of psychopharmacological influences on psychomotor and psychosensory functions and on performance and on intelligence.] *Rev. Psychol. appl.*, 1961, 11, 387-401.—Testing by "simple" procedures, efficiency psychophysiology, and complex phenomena can be investigated. "In psychopharmacologic experimentation, we can see how the results of such tests are related to interfering variables. Though a structured experimental situation, a careful choice of subjects, a precise determination of the experimental frame, the choice of appropriate tests, a sufficient statistical elaboration and adequate interpretation, are all necessary to psychopharmacology research, to reach scientifically sound and operational conclusions. Each of these items evokes a series of problems, showing that we are still far from an optimal methodology for the experimental study of sensory, psychomotor performance and intellectual alterations brought about by psychotropic drugs. We feel as being fundamental the qualitative aspect of such study, together with an internal critical attitude, to isolate those factors still hard to define with precision."—*W. W. Wattenberg.*

2641. Pichot, P. (Hôpital Ste.-Anne, Paris, France) *Structure de la personnalité et appréciation des modifications psychologique produites par les drogues psychotropes.* [Personality structure and estimation of psychological modifications produced by psychotropic drugs.] *Rev. Psychol. appl.*, 1961, 11, 353-360.—The Presidential Address at the Fourteenth International Congress of Applied Psychology. This paper stresses the importance of research on individual differences in the effects of psychotropic drugs and on the relationship of personality structure to such effects. Among animals of a given species there exists a variability in the action of drugs which is nonspecific. In experiments on humans there are both quantitative and qualitative differences in the effects of a drug upon different Ss. If we consider the action of drugs administered to mental patients we also encounter a portion of their effects which is nonspecific. While there are specific effects which render the drugs useful, a full understanding of the variations is necessary for the devel-

opment of theory as to their efficacy.—*W. W. Wattenberg.*

2642. Sharp, Joseph C., Nielson, Harold C., & Porter, Paul B. (Walter Reed Army Inst. Research, Washington, D. C.) *The effect of amphetamine upon cats with lesions in the ventromedial hypothalamus.* *J. comp. physiol. Psychol.*, 1962, 55(2), 198-200.—Amphetamine was administered to 10 cats, 4 of which had been rendered hyperphagic by hypothalamic lesions. The drug reduced food intake in the controls but not in the hyperphagic animals—a finding consistent with the hypothesis that amphetamine stimulates the satiety center in the ventromedial hypothalamus.—*W. A. Wilson, Jr.*

2643. Sines, Jacob O., & Keefe, Daniel J. (Washington U. School Medicine, St. Louis) *The relationship between pharmacologically modified operant response rate and heart rate.* *J. genet. Psychol.*, 1962, 100(2), 267-274.—10 male albino rats were trained under 21 hours of food deprivation to obtain food reward in a Skinner box. Their response rate was observed 3 times daily under conditions of no injection, .1 cc of normal saline, .4 mg/kg of epinephrine, and 5 mg/kg of chlorpromazine. Results were: (a) Epinephrine and chlorpromazine significantly reduced bar pressing rate from the rate observed following saline injection. (b) The doses of epinephrine and chlorpromazine used were behaviorally equivalent. and (c) The overall relationship between heart rate and bar pressing rate closely resembled the inverted U function predicted on the basis of an activation hypothesis.—*Author abstract.*

2644. Steinberg, Hannah. (University Coll., London, England) *Methods and problems of measuring drug-induced changes in emotions and personality.* *Rev. Psychol. appl.*, 1961, 11, 361-372.—All that any drug can do is to act on ongoing behavior and modify it; hence its effects must always to some extent be dependent upon the nature of the behavior going on at the time, and this in turn depends upon the S's personality, his current emotions, his past experience, and the setting in which the drug is administered. In determining the effects of drugs many methods have been used. These can be classified as (a) descriptive methods, (b) methods depending upon the efficiency of performance, and (c) physiological methods. To illustrate the complexity of the problem, results are reported from an experiment in which a control group, a group administered amphetamine, a group administered cyclobarbitone, and a group administered a mixture of the 2 were presented with a tapping task and encouraged to report on their feelings and sensations. On the tapping task the effects of the 2 drugs were opposite and in the mixture cancelled out; however, as to feelings of elation, the effects were in the same direction and seemed to augment each other. Radiation

2651. Furchtgott, Ernest, & Wechkin, Stanley. (U. Tennessee) Avoidance conditioning as a function of prenatal X irradiation and age. *J. comp. physiol. Psychol.*, 1962, 55(1), 69-72.—Avoidance learning in a Miler-Mowrer box was examined in rats 3½, 14, or 20 months of age, ½ of which had been X irradiated in utero. Conditioning was more rapid in the irradiated rats than the controls, presumably due to differences in fearfulness. Rate of conditioning decreased with age, apparently due to a decrease in response speed. The interaction of age

and irradiation was not significant.—*W. A. Wilson, Jr.*

2652. Hunt, Edward L., & Kimeldorf, Donald J. (USN Radiological Defense Lab., San Francisco, Calif.) Evidence for direct stimulation of the mammalian nervous system with ionizing radiation. *Science*, 1962, 137(Whole No. 3533), 857-859.—Exposure to X-rays of low intensity immediately arouses the sleeping rat. Activation of the central nervous system, indicated by behavioral and heart rate responses, depends upon the rate but not the dose of exposure. The arousal reaction is not dependent upon direct visual stimulation. The nervous system is probably directly sensitive to ionizing radiation.—*Journal abstract*.

2653. Kaplan, Sylvan J. (Texas Technological Coll.) Radiation research in psychology: An analysis of techniques in maze experimentation. *Psychol. Bull.*, 1962, 59(2), 153-160.—The Lashley III maze has been frequently used in studying the effects of radiation on rats because it has been efficient in showing differential effects upon learning as related to amount of cortical insult. Although results have been remarkably consistent, an analysis of methodological procedures reveals a considerable variation. The need for standardizing apparatus and procedures is discussed.—*W. J. Meyer*.

2654. Schaefer, Hermann J. (USN School Aviation Medicine, Pensacola, Fla.) LET analysis of tissue ionization dosages for proton radiations in space. *USN Sch. Aviat. Med. res. Rep.*, 1962, Proj. MR005-13-1002, Subtask 1, Rep. No. 21. ii, 13 p.—Earlier computations of the distribution of the ionization dosage within a spherical tissue phantom of 30 cm. diameter behind 3 different shield thicknesses for exposure to flare-produced and Van Allen Belt protons are amended by a separate evaluation of the dose fraction produced at a linear energy transfer (LET) exceeding 40 kev/micron. For the 1st radiation, this fraction is always smaller than 2%, and for the 2nd, smaller than 0.5%. Separate determination of the 2 fractions seems advisable for assessment of the net exposure status and estimates of late effects, since damage from radiation of high LET is non-recoverable.—*USN SAM*.

2655. Schaefer, Hermann J. (USN School Aviation Medicine, Pensacola, Fla.) Time profile of tissue ionization dosages for Bailey's synthetic spectrum of a typical solar flare event. *USN Sch. Aviat. Med. res. Rep.*, 1962, Proj. MR005-13-1002, Subtask 1, Rep. No. 22. ii, 9 p.—Bailey's set of spectra describing development and decay of a typical flare-produced solar particle beam, based on comparative evaluation of radar observations of polar cap absorption events and direct measurements with high altitude vehicles, is evaluated in terms of tissue dose rates and integral dosages within a spherical tissue target behind different shielding. For light shielding a maximum instantaneous dose rate of 4.7 r/hr and an integral dose of 200 r for the total duration of 64 hours are obtained. Tables and graphs show the complex changes occurring during build-up and decay of a flare event.—*USN SAM*.

Stress

2656. Longo, Alexander A., & Doll, Richard E. (USN School of Aviation Medicine, Pensacola, Fla.)

The relationship of arousal measures to subsequent behavior: I. Group estimates of individual stress susceptibility. *USN Sch. Aviat. Med. res. Rep.*, 1962, Proj. MR005.13-3003, Subtask 14, Rep. No. 1. ii, 10 p.—The relationship between physiological arousal measures taken under 3 physically threatening conditions and ratings of stress susceptibility was investigated. Consistency in arousal response was also examined. The arousal measures are designated as changes in pulse and blink rate under threat of physical pain. Stress susceptibility is defined as over-reactivity to threat of impending physical pain as estimated by peer ratings. The results indicated a significant relationship between one blink rate measure and ratings of stress susceptibility, and a partial interstress and intermeasure consistency of response to physical threat. The use of muscular tension measures (e.g., blink rate) for predictive purposes appears to have potential value.—*USN SAM*.

NUTRITION

2658. Pshonok, A. T., & Gribanov, A. A. (Chair Normal Physiology, Krasnoyarsk Medical Inst., USSR) O vliianii vitamina B₁₂ na uslovno-reflektornuiu deiatel'nost' sobak. [Effect of vitamin B₁₂ on the conditioned activity of dogs.] *Zh. vyssh. nervn. Deiatel.*, 1961, 11(6), 1026-1031.—The vascular CRs of 4 dogs were studied. Light and sound were used as CS. Vitamin B₁₂ was administered in doses of 30, 80-100, and 500 γ . Marked disturbances of reflex activity were found. These showed in a weakening of the CR up to their full disappearance, in the intensification of UR, and in an increase of inhibition.—*A Cuk*.

GENETICS & BEHAVIOR

2659. Broadhurst, P. L. (U. London) Analysis of maternal effects in the inheritance of behaviour. *Anom. Behav.*, 1961, 9(3-4), 129-141.—Postnatal maternal effects in rats were assessed by cross-fostering during 6 generations of breeding for extremes of emotional elimination while in an open-field. Prenatal effects were tested by reciprocal crossing between lines. Scores showed little evidence of pre- or post-natal effects "under conditions judged favorable for its occurrence."—*W. J. Coppock*.

2660. Carvalho, G. G., & Da Cruz, M. P. (U. Brazil) Transfer of the "sex-ratio" factor in *Drosophila willistoni* by ingestion. *Science*, 1962, 138(Whole No. 3536), 51.—39 females from a normal strain of *Drosophila willistoni* were kept in bottles containing a drop of a supernatant of a macerate of "sex-ratio" condition and transmitted it to their progenies.—*Journal abstract*.

2661. Fuller, John L. (Roscoe B. Jackson Memorial Lab., Bar Harbor, Me.) Heredity, animal behavior and psychiatry. *J. nerv. ment. Dis.*, 1962, 135(1), 5-9.—"This paper is divided into three parts. The first section is an account of studies conducted on dogs with my colleague, Dr. J. P. Scott, which illustrates certain general principles of behavior genetics. A second portion deals briefly with significant new developments which are likely to assume

greater importance in the next decade. Finally, the paper concludes with a discussion of the two basic experimental approaches to behavior genetics which, starting at opposite ends of the continuum between genes and behavior, eventually converge on the same basic problems."—*N. H. Pronko*.

2662. Hulse, Frederick S. (U. Arizona) Warfare, demography and genetics. *Eugen. Quart.*, 1961, 8(4), 185-197.—Anthropological evidence is marshalled for the thesis that the major genetic effect of warfare has been to reduce genetic differences between populations and to shift gene frequencies. Little support was found for the idea of a biological rather than cultural basis for characterizing tribes or nations as warlike or peaceful. It does appear that the relative proportions of populations may have been considerably affected by warfare, especially when victory led to extermination or slavery of the defeated.—*S. G. Vandenberg*.

2663. Lienert, G. A. & Reisse, H. (U. Hamburg & Marburg, Germany) Ein korrelationsanalytischer Beitrag zur genetischen Determination des Neurotizismus. [A correlation-analytical contribution to the problem of genetic determination of neuroticism.] *Psychol. Beitr.*, 1962, 7(1), 121-130.—In dealing with the problem of the relative share of hereditary and milieu factors in the formation and degree of Eysenck's "neuroticism," the method developed by C. Burt and M. Howard is applied. 200 families and 721 family members answered the questionnaire of W. Horn. On the basis of the answers, parents-children and interparental correlations were computed. The results show that if a medium incomplete dominance of the characteristic "neuroticism" is assumed, the share of hereditary and milieu factors is 50% for each factor. (English & French summaries)—*H. J. Priester*.

2664. Palermo University, Psycho-Statistic Centre. Heredity and environment in the development of mental activity. *J. psychol. Res., Madras*, 1962, 6(1), 52-53.—Studies with 10,000 children show positive correlations between intelligence and socioeconomic level and negative correlations between intelligence and family size. The social consequences are important.—*U. Pareek*.

2665. Vandenberg, Steven G. (U. Louisville) The Hereditary Abilities Study: Hereditary components in a psychological test battery. *Amer. J. hum. Genet.*, 1962, 14(2), 220-237.—"A battery of psychological tests furnishing one hundred seventeen separate scores was administered to forty-five pairs of identical twins and thirty-seven pairs of fraternal twins drawn from high schools in Ann Arbor, Ypsilanti, Dearborn, and Detroit, Michigan. Six groups of variables were measured: (1) Thurstone's Primary Mental Abilities Tests, (2) a variety of other cognitive and achievement tests, (3) motor skills, (4) perceptual skills, (5) sensory tests and measures of musical ability and interest, and (6) personality. Each of these six groups contained a number of variables for which a significant degree of hereditary control was found, as indicated by an F above 2.00 for the ratio between the fraternal and identical within-pair variances. The proportion of variables for which at least a 5 per cent level of significance was reached varied between these six groups of variables. For 24, or 20.5 per cent of the one hundred seventeen variables, the F ratio exceeded the

1 per cent level of significance, and for another twenty-eight or 23.9 per cent the F ratio exceeded the 5 per cent level. Some evidence is presented which indicates that psychological tests which work well as predictors of social criteria such as success in academic studies, etc., may not be most promising for studies of hereditary factors."—*S. G. Vandenberg.*

2666. Williams, Carl D., Zerof, Selwyn A., & Carr, Richard M. (U. Miami) Exploratory behavior of the crosses of three strains of rats. *J. comp. physiol. Psychol.*, 1962, 55(1), 121-122.—Exploratory behavior in a small Y maze was studied for crosses of 3 strains of rat. The 2 crosses possessing hooded parentage explored more than the albino-black cross, displaying that genetic factors play a part in the determination of such behavior.—*W. A. Wilson, Jr.*

LATERAL DOMINANCE

2667. Reed, G. F., & Smith, A. C. (U. Manchester, England) A further experimental investigation of the relative speeds of left and right-handed writers. *J. genet. Psychol.*, 1962, 100(2), 275-288.—A group of 58 left-handed writers representing 3 age levels and drawn from 7 schools were matched with a group of right-handed writers by sex, age, and school. Using pen and ink the Ss carried out a simple repetitive writing task and a prose transcription speed test for 10 minutes. Free compositions were obtained from 2 similarly equated groups, of 54 children each, from 6 other schools. No significant differences were found between the groups on any of the tests where either speed or legibility was concerned. The differences between schools were greater than handedness or sex differences in writing.—*Author abstract.*

ANIMAL PSYCHOLOGY

2668. Byck, Robert, & Hearst, Eliot. (Clinical Neuropharmacology Research Cent.) Adjustment of monkeys to five continuous days of work. *Science*, 1962, 138(Whole No. 3536), 43-44.—The efficiency of well-trained monkeys improved after repeated exposures to a prolonged task. This result suggests that resistance to fatigue may be increased by prior experience with the fatiguing situation.—*Journal abstract.*

2669. Vatsuro, E. G. (Sechenov Inst. Evolutionary Physiology, USSR Acad. Sciences, Leningrad) O nekotorykh obshchikh zakononomernostyakh vysshei nervnoi deiatel'nosti (povedeniia) zhivotnykh. [Some general laws governing the higher mental activity (behavior) of animals.] *Zh. vyssh. nervn. deiatel.*, 1961, 11(6), 1012-1018.—There is a need to study the higher nervous activity not only by means of limited techniques such as the EEG but also from the general biological and behavioral point of view. This aspect is more important and more in accordance with the Pavlovian concepts. Several papers from the author's school dealing with adaptive behavior are summarized.—*A. Cuk.*

NATURAL OBSERVATION

2670. Agin, Martin Jack. (Rutgers U.) A descriptive analysis of the behavior patterns in the

ring dove (*Streptopelia risoria*). *Dissert. Abstr.*, 1961, 22(6), 2061.—*Abstract.*

2671. Alabaster, J. S., & Robertson, K. G. (Ministry Agriculture, London, England) The effect of diurnal changes in temperature, dissolved oxygen and illumination on the behavior of roach (*Rutilus rutilus*), bream (*Abramis brama*) and perch (*Perca fluviatilis*). *Anim. Behav.*, 1961, 9(3-4), 187-192.—Movements of shoals of 10 or more fish were watched in a 100-foot tank in which temperature and oxygen could be manipulated and monitored. The normal increase in activity at dawn was seen during constant temperature and oxygen.—*W. J. Coppock.*

2672. Bragg, Arthur N. (U. Oklahoma) A theory of the origin of spade-footed toads deduced principally by a study of their habits. *Anim. Behav.*, 1961, 9(3-4), 178-186.—Literature on habits of *Scaphiopus* is critically reviewed and used to support arguments about their evolutionary history.—*W. J. Coppock.*

Experimental studies of the behavior of *Anarete* near *felti* Pritchard in artificially induced swarms (*Cecidomyiidae*, *Diptera*). *Anim. Behav.*, 1961, 9(3-4), 213-219.—"The relations between some characteristics of the source of attraction and the swarming of the midge were described. White Bristol boards against a dark background were used as the source of attraction. It was found that the degree of attraction varied with the size and position of the boards, the general lighting, and the proximity, intensity and position of other sources of attraction. An association between swarming and mating was suggested."—*W. J. Coppock.*

2674. Durand, Marguerite. Notes sur le comportement de deux souris. [Observations of the behavior of two mice.] *J. Psychol. norm. pathol.*, 1961, 58(2), 217-218.—Naturalistic observations of 2 mice in captivity—1 gray, 1 white, of very different temperament and intelligence.—*M. L. Simmel.*

2675. Goodrick, C. L. (U. Pittsburgh Medical School) Differential adaptation of activity in the blind cave fish, *Anoptichthys jordani*. *Percept. mot. Skills.*, 1962, 14(1), 10.—This preliminary report investigated the environmental adaptation of the blind cave fish. Activity change over a 35-minute period after being moved from the home tank to a plastic container is depicted graphically. Activity in terms of mean quadrants traversed per minute disclosed 2 types of S reaction: (a) initial exploratory behavior with frequent contact with the container followed by decreased contact and increased activity (locomotion), and (b) the same initial activity followed by increased contact and vigorous escape movements but low activity (locomotion).—*W. H. Guertin.*

2676. Mitchell, Rodger. (U. Florida) Behaviour of the larvae of *Arrenurus fissicornis* Marshall, a water mite parasitic on dragonflies. *Anim. Behav.*, 1961, 9(3-4), 220-224.—The attachment of larvae as the host emerges from the naiad skin is described. When emergence was interrupted 30 seconds or more after initiation, the sequence of mite behavior was unaltered. "Thus it appears that timing alone is responsible for site specificity and that the stimulus evoking the behaviour of mite larva during host emergence is perceived during the first thirty seconds of host emergence."—*W. J. Coppock.*

EARLY EXPERIENCE (INCLUDING IMPRINTING)

2677. Bell, Robert W., & Felbinger, Robert J. (Allegheny Coll.) Effects of free and restricted environmental experience on the development of socio-sexual behavior in the rat. *Psychol. Rep.*, 1962, 10(2), 351-356.—"Sixty-seven Wistar albino rats, comprising eight litters, were reared under conditions of perceptual restriction or enhancement during either pre-weaning or postweaning development. At 43 days of age all Ss were sexually segregated, housed in mesh cages, and tested for indices of mating behavior." Lower frequencies of various types of sexual activity were observed for rats reared under restricted conditions, with larger effects obtained when the restricted environment was present during pre-weaning than post-weaning. Several interpretations of the results were discussed.—B. J. House.

2678. Campbell, Byron A., & Campbell, Enid Hobart. (Princeton U.) Retention and extinction of learned fear in infant and adult rats. *J. comp. physiol. Psychol.*, 1962, 55(1), 1-8.—Conditioned fear was established in a Miller learned-fear apparatus, with groups of rats varying from 18 to 100 days of age. Retention (over intervals from 0 to 42 days) varied directly with age at the time of conditioning, but the rate of immediate extinction of fear did not correlate with age. It is concluded that the importance of early experience in determining adult motives cannot be attributed to greater retention, or resistance to extinction, of drives acquired in infancy.—W. A. Wilson, Jr.

2679. Ganz, Leo, & Riesen, Austin H. (Brown U.) Stimulus generalization to hue in the dark-reared macaque. *J. comp. physiol. Psychol.*, 1962, 55(1), 92-99.—Macaques were reared in total darkness to the age of 10 weeks, and were then taught to discriminate a given monochromatic stimulus from darkness. Generalization to a 180-m μ spectrum was measured under extinction. The experimental group appeared to learn the discrimination more slowly than a control group. Decremental generalization gradients were obtained, which were steeper and more concave upward in the experimental group.—W. A. Wilson, Jr.

2680. Gray, P. H. (Montana State Coll.) Is the imprinting critical period an artifact of a biological clock? *Percept. mot. Skills*, 1962, 14(1), 70.—Chicks hatched and maintained in isolation were placed in a test box to determine object preference in the approach responses during their first 4 days of life. A statistically significant diurnal rhythm in preference for adult vs. age-mate is found across all 4 days. Preference for the adult increase to a maximum around midnight followed by a reversal to preference for the age-mate. The danger of this biological clock phenomenon appearing as an artifact in imprinting studies is emphasized.—W. H. Guertin.

2681. Gray, P. H. Verification of Spalding's method for controlling visual experience by hooding chicks in the shell. *Proc. Mont. Acad. Sci.*, 1962, 21, 120-123.—"For the first time, the experimental work [of D. A. Spalding] has been duplicated using his method. Fifty-four chicks, hooded in the shell, showed the following behavior: backward locomotion; marked initial nystagmus after removal of the hood, more severe in older chicks (five to six days), with initial inaccuracy of visual-motor responses; a greeting ritual (in chicks at least four days old at unhooding); a fear of man evidenced by

running toward a localized light source on the animal's horizon (in chicks unhooded at four days and older). This verification of Spalding's work provides another confirmation of his genius."—C. H. Ammons.

2682. Kaufman, I. C., & Hinde, R. A. (Cambridge) Factors influencing distress calling in chicks, with special reference to temperature changes and social isolation. *Anim. Behav.*, 1961, 9(3-4), 197-204.—Chicks were placed in a strange pen 24 hours after hatching and tested for rate of distress calling on Days 1 through 7. Rate of calling was higher at 60° F. than 110° F. for those reared in groups, and rate of calling increased with age. Chicks reared in isolation did not show this age effect. Results are discussed in relation to critical periods in imprinting.—W. J. Coppock.

2683. Klopfer, Peter H., & Gottlieb, Gilbert. (Duke U.) Imprinting and behavioral polymorphism: Auditory and visual imprinting in domestic ducks (*Anas platyrhynchos*) and the involvement of the critical period. *J. comp. physiol. Psychol.*, 1962, 55(1), 126-130.—Peking ducklings were exposed to a moving decoy which emitted sounds, and were later tested for response to the sounds alone, and to the silent decoy. Auditory imprinting appeared to take place at an earlier age than visual imprinting, but the strength of auditory and visual imprinting did not appear to be correlated. It is suggested that variability in modality of sensitivity may be adaptive to the brood, since it generally follows the most responsive individual in any situation.—W. A. Wilson, Jr.

2684. Marr, John Nelson. (Michigan State U.) Varying stimulation and imprinting in dogs. *Disser. Abstr.*, 1962, 22(12), 4403.—Abstract.

2685. Newton, Grant; Bly, Chauncey G., & McCrary, Cedric. (Upstate Medical Cent., Syracuse, N. Y.) Effects of early experience on the response to transplanted tumor. *J. nerv. ment. Dis.*, 1962, 134(6), 522-527.—"The purpose of this study was to determine the effect of handling introduced in the immediate post-weaning period on mortality of male and female albino rats arising from implantation at 45 days of age with cells of Walker carcinoma 256. Results indicated that handled rats as a group survived longer than did nonhandled littermate controls. Neither males nor females, when considered separately, lived significantly longer than controls. Autopsies performed on a sample of rats from each group revealed that handled animals had smaller adrenals by percentage weight than did corresponding controls."—N. H. Pronko.

2686. Ressler, Robert H. (Western Reserve U.) Parental handling in two strains of mice reared by foster parents. *Science*, 1962, 137 (Whole No. 3524), 129-130.—The amount of handling received in 10 daily tests by infant mice reared by foster parents was significantly affected by the strain of pups and by the strain of foster parents. This finding suggests that at least some behavioral differences between highly inbred strains may be due to early environmental rather than genetic variation.—Journal abstract.

2687. Spence, Janet Taylor, & Maher, Brendan A. (VA Hosp., Iowa City, Ia.) Handling and noxious stimulation of the albino rat: I. Effects on subsequent emotionality. *J. comp. physiol. Psy-*

chol., 1962, 55(2), 247-251.—Emotional responsiveness was studied in rats which had been exposed to handling or intense auditory stimulation (or neither), either before or after weaning. Responsiveness was greatest in untreated controls, and greater in post-weaning than preweaning experimental groups. However, handling and auditory trauma per se had an effect no greater than the stimulation incidental to being moved to the experimental room as if in preparation for experimental treatment.—*W. A. Wilson, Jr.*

2688. Spence, Janet Taylor, & Maher, Brendan A. (VA Hosp., Iowa City, Ia.) Handling and noxious stimulation of the albino rat: II. Effects on subsequent performance in a learning situation. *J. comp. physiol. Psychol.*, 1962, 55(2), 252-255.—Running speed in a straight alley was studied in rats which had been exposed to handling or intense auditory stimulation (or neither), either before or after weaning. Speeds were slower in control groups and in the postweaning experimental groups than in the preweaning experimental groups.—*W. A. Wilson, Jr.*

2689. Thompson, William R., & O'Kieffe, M. W. (Wesleyan U.) Imprinting: Its effect on the response to stress in chicks. *Science*, 1962, 135 (Whole No. 3507), 918-919.—Young chicks imprinted to surrogate mothers were compared with nonimprinted controls on 2 tests designed to measure resistance to stress. $\frac{1}{2}$ of each group was run with and $\frac{1}{2}$ without a surrogate present during the stress. One test involving survival time under starvation showed no effects. However, in the other tests, imprinted chicks showed fewer distress calls in response to auditory stimulation than nonimprinted controls.—*Journal abstract.*

REFLEXES & INSTINCTIVE BEHAVIOR

2690. Abercrombie, Barbara, & James, H. (Queen's U., Ontario) The stability of the domestic chick's response to visual flicker. *Anim. Behav.*, 1961, 9(3-4), 205-212.—The approach response to an intermittent light source or a stimulus previously paired with intermittent light was repeatedly elicited in a total of 64 chicks. No decrement during 12 testing days appeared in the approach to intermittent light. In another group, a stationary object was presented alone, after 2 days of pairing with a flickering light. Approach during the next 13 days decreased some when 3 tests were given a day but did not change significantly when only 1 test per day was given.—*W. J. Coppock.*

2691. Davis, Roger E. (U. Michigan) Daily rhythm in the reaction of fish to light. *Science*, 1962, 137(Whole No. 3528), 430-432.—Bluegills in a 24-hour light-dark cycle were exposed briefly to light at a random time in the daily dark period. The duration of the accompanying "light-shock reaction" daily became longer at times early in the dark period and shorter at times in the later hours of darkness.—*Journal abstract.*

2692. Davis, Russell, & Cockrum, E. Lendell. (U. Arizona) Repeated homing exhibited by a female pallid bat. *Science*, 1962, 137(Whole No. 3527), 341-342.—A pallid bat returned home from 8 consecutive releases from 6 distinctly different directions and from distances ranging from 21 to 68 miles. This performance indicates that chance alone cannot be a major factor in homing, and that certain

abilities possessed by this bat, and not simply randomness, must have been in operation.—*Journal abstract.*

2693. Erlenmeyer-Kimling, Loise Fay. (Columbia U.) A genetic analysis of geotaxis in *Drosophila melanogaster*. *Dissert. Abstr.*, 1961, 22(4), 1262.—*Abstract.*

2694. Free, J. B. (Rothamsted Experiment Station, England) The stimuli releasing the stinging response of honeybees. *Anim. Behav.*, 1961, 9(3-4), 193-196.—Muslin-wrapped cotton balls were suspended by threads and displayed near hives. More stings were left in balls that were dark-colored on dark backgrounds, that had odor of sting venom or human sweat, or that were moving rapidly. Smoke and various repellents reduced the number of stings.—*W. J. Coppock.*

MOTIVATION & EMOTION

2698. Ader, Robert, & Belfer, Myron L. (School of Medicine and Dentistry, U. Rochester) Emotional behavior in the rat as a function of maternal emotionality. *Psychol. Rep.*, 1962, 10(2), 349-350.—Mean number of squares traversed in the open field was higher for 31 offspring of high-emotional mothers than for 25 offspring of low-emotional mothers during the 1st test but not the 2nd, yielding a significant groups \times tests interaction. Females had significantly higher scores than males.—*B. J. House.*

2699. Bacon, W. Edward; Snyder, Harry L., & Hulse, Stewart H. (Johns Hopkins U.) Saccharine preference in satiated and deprived rats. *J. comp. physiol. Psychol.*, 1962, 55(1), 112-114.—Rats were given 1-hr., 2-bottle preference tests with water and each of 6 concentrations of saccharine; $\frac{1}{2}$ the animals had been deprived of food and water. Deprivation increased relative preference for saccharine, as well as increasing water intake. The effects due to drive state were more pronounced as saccharine concentration increased, and deprived rats preferred a higher concentration than did satiated rats.—*W. A. Wilson, Jr.*

2700. Belanger, David, & Feldman, Samuel M. (U. Montreal, Canada) Effects of water deprivation upon heart rate and instrumental activity in the rat. *J. comp. physiol. Psychol.*, 1962, 55(2), 220-225.—Heart rate and lever-press rate were measured in rats that were pressing for water under various conditions of deprivation. Heart rate increased monotonically with length of deprivation. Lever-press rate increased with deprivation up to 48 hrs.,

but decreased with greater deprivation. "This type of data seems to find a most plausible explanation in the context of the 'energetics' definition of drive and the activation hypothesis."—*W. A. Wilson, Jr.*

2701. Best, Jay Boyd, & Rubinstein, Irvin. (Walter Reed Army Inst. Research) Environmental familiarity and feeding in a planarian. *Science*, 1962, 135(Whole No. 3507), 916-918.—Planarians, in common with higher animals, tend to delay feeding in environmental conditions to which they are habituated.—*Journal abstract.*

2702. Bolles, Robert C. (Hollins Coll.) A psychophysical study of hunger in the rat. *J. exp. Psychol.*, 1962, 63(4), 387-390.—"Rats were trained to respond differentially on the basis of small and large prefeedings. When the discrimination had become established (the median trials to criterion was 43) the task was made progressively more difficult by reducing the difference between small and large prefeedings. The point at which performance fell to 75% correct was defined as a discriminability threshold, and such thresholds obtained at different points on the prefeeding continuum were used to construct a psychophysical 'scale' of hunger."—*J. Arbit.*

2703. Bolles, Robert C. (Hollins Coll.) The readiness to eat and drink: The effect of deprivation conditions. *J. comp. physiol. Psychol.*, 1962, 55(2), 230-234.—The latency of eating and drinking in a new situation was measured for rats that had been deprived of food or water. In general, latencies could be described as a power function of deprivation time; prior deprivation experience facilitated eating and drinking. Successive measures suggested that food reinforces eating only if the rat has incurred a weight-loss, but water is a reinforcer (of drinking) provided 24 hrs. of deprivation has ensued.—*W. A. Wilson, Jr.*

2704. Denenberg, Victor H., & Morton, John R. C. (Purdue U.) Effects of environmental complexity and social groupings upon modification of emotional behavior. *J. comp. physiol. Psychol.*, 1962, 55(2), 242-246.—Daily from birth until weaning, rats were either handled or not handled; for the following 25 days, they lived either in laboratory cages or in Hebb free-environmental boxes. Both handling and free-environmental experience acted to reduce emotionality measured later in life. Mixing handled rats with nonhandled rats in the free-environment boxes was beneficial for handled Ss, but detrimental for nonhandled rats. An explanation is suggested, "based upon the social dynamics of play behavior."—*W. A. Wilson, Jr.*

2705. Draper, William Arthur. (U. Oregon) A behavioral study of the home-cage activity of the white rat under normal, deprivation, and drug conditions. *Dissert. Abstr.*, 1962, 22(12), 4418.—*Abstract.*

2706. Finger, Frank W. (U. Virginia) Activity change under deprivation as a function of age. *J. comp. physiol. Psychol.*, 1962, 55(1), 100-102.—Food deprivation (for 48 hr.) of rats 31-35 days of age to much larger increases in activity, measured as movement across the midline of a stationary cage, than were found in older rats in earlier studies using the same apparatus. When later subjected to water deprivation, the rats appeared to become less active.—*W. A. Wilson, Jr.*

2707. Halstead, Ward C., & Gallagher, Brian B. (U. Chicago) Autoregulation of amino acids intake in the albino rat. *J. comp. physiol. Psychol.*, 1962, 55(1), 107-111.—In addition to water and a basal diet, rats were presented with complete and incomplete (lacking threonine) amino acid solutions in a 2-bottle situation; the solutions were varied in left-right position daily. 42 out of 54 rats discriminated, choosing more of the complete solution, demonstrating "a capacity for autoregulation of an essential amino acids solution in a survival situation."—*W. A. Wilson, Jr.*

2708. Larsson, Knut, & Essberg, Leif. (U. Goteborg) Effect of age on the sexual behaviour of the male rat. *Gerontologia*, 1962, 6(2-3), 133-143.—The male rat mating behaviour was studied in 4 different age groups, 103-114, 125-164, 450-510, and 573-651 days, respectively, from the stock of albino rats bred and maintained at the Goteborg Laboratory. The Ss were allowed to mate until they attained a specified criterion of exhaustion. The capacity to attain repeated ejaculations increased with age. The number of intromissions preceding ejaculation was highest in the youngest age group and progressively decreased with age. The response latencies were progressively reduced up to 450-510 days of age but became prolonged in the oldest age group. The young male copulated with maximal speed immediately after presentation of the receptive female; the Ss in the 2 oldest age groups showed minimal response latencies only in the presence of facilitatory effects from 1 and 2 series of copulations. This was considered to indicate a heightened threshold in old age for the arousal of the copulatory response.—*L. Shatin.*

2709. Menzel, Emil W., Jr., & Davenport, Richard K., Jr. (Yerkes Lab. Primate Biology) The effects of stimulus presentation variable upon chimpanzee's selection of food by size. *J. comp. physiol. Psychol.*, 1962, 55(2), 235-239.—Chimpanzees were presented with choices between 2 pieces of food, differing in size. Trials differed with respect to the way in which the pieces were presented before choice (both visible, or only one) and during choice (both or one or neither visible). Choice of the larger piece was most frequent when both pieces were visible, although presentation of the larger piece alone led to almost as good performance. However, when the size difference of the pieces was relatively great, differences in performance under the various conditions were not very apparent.—*W. A. Wilson, Jr.*

2710. Ross, Sherman; Goldstein, Irwin, & Kaplan, Stephen. (American Psychological Ass. Central Office) Perceptual factors in eating behavior in chicks. *J. comp. physiol. Psychol.*, 1962, 55(2), 240-241.—Chicks under 4-hr. food deprivation were presented with piles of grain of different size; the amount eaten in a 30-min. interval was linearly related to the size of the pile. It is suggested that more food is eaten from a larger pile because the chick can get at the food more easily.—*W. A. Wilson, Jr.*

2711. Smith, Moncrieff; Pool, Ronald, & Weinberg, Harold. (U. Washington) Role of bulk in the control of eating. *J. comp. physiol. Psychol.*, 1962, 55(1), 115-120.—6 experiments are reported which demonstrate that rats eating 1 meal per day can maintain their weight when their diet is adulterated with cellulose or kaolin, but only if the unadulterated basic diet is of high caloric density. With

Purina chow, rats can survive slight adulterations, although at a reduced weight. Cues from stomach bulk appear to be operating when animals stop eating before attaining normal caloric intake, but are of minor importance in stopping eating when a normal intake can be achieved.—*W. A. Wilson, Jr.*

2712. Steinberg, June, & Bindra, Dalbir. (McGill U.) Effects of pregnancy and salt-intake on genital licking. *J. comp. physiol. Psychol.*, 1962, 55 (1), 103-106.—Pregnant and nonpregnant females, and male rats, were observed in their home cages; time spent in licking the genital area was recorded. Pregnancy was shown to increase genital licking. Since consumption of a salt solution decreased genital licking in females, an interpretation of pregnancy-induced genital licking in terms of salt deficiency is supported.—*W. A. Wilson, Jr.*

2713. Sterritt, Graham M. (U. Colorado School Medicine) Inhibition and facilitation of eating by electric shock. *J. comp. physiol. Psychol.*, 1962, 55 (2), 226-229.—Rats given unavoidable electric shock ate more when the shock was on than when it was off, and ate more during shock than was eaten in a comparable period by control rats. However, shocked rats underate when shock was off, and thus ate less in the total experimental period—a finding "consistent with usual reports of inhibition of eating by competing responses elicited by anticipation of shock."—*W. A. Wilson, Jr.*

2714. Theios, John; DeRivera, Joseph, & Aronson, Elliot. (U. Texas) Modification of the rat's saline intake gradient by experience with specific concentrations. *Psychol. Rep.*, 1962, 10 (2), 487-490.—"Three groups of nine rats each . . . raised from birth with different concentrations [.00%, .45%, or .90%] of sodium chloride solution as their only drinking water . . . were tested at maturity by making all three concentrations available in an ad libitum choice situation. For all three groups, the daily amount of each test solution ingested . . . was an increasing function of the concentration . . . [but] the relative amount of each solution ingested varied from group to group. Ss drank very little of solutions lower in concentration than that on which they were raised. The obtained significant interaction between amount of each test solution ingested and the concentration on which S was raised can be interpreted as demonstrating a modification of the rat's gradient of saline intake through learning."—*B. J. House.*

2715. Webb, Wilse B., & Agnew, Harman W. (U. Florida) Sleep deprivation, age, and exhaustion time in the rat. *Science*, 1962, 136 (Whole No. 3522) 1122.—Male rats were maintained on a constantly moving wheel in a study of prolonged sleep deprivation. The results obtained revealed a striking negative relationship between age and resistance to exhaustion.—*Journal abstract.*

SENSORY PROCESSES

2716. Bonaventure, Nicole. (Faculté Sciences, Strasbourg, France) Sensibilité spectrale et vision des couleurs chez le chat. [Spectral sensitivity and color vision in the cat.] *Psychol. Franc.*, 1962, 7 (1), 75-82.—The primary purpose of this study was to investigate the possibility of a Purkinje effect in cats using a jumping-type discrimination apparatus. The result, on 2 cats, was negative; the maximum spectral sensitivity in a photopic environment was about 490

mμ. In other problems the cats showed a chromatic sensitivity to red and only to red. These data were considered to be consistent with those obtained with other nocturnal animals.—*C. J. Adkins.*

2717. Elliott, D. N., Frazier, L., & Riach, W. (Henry Ford Hosp.) A tracking procedure for determining the cat's frequency discrimination. *J. exp. Anal. Behav.*, 1962, 5 (3), 323-328.—Cats were reinforced with food only when a steady tone was present and the animal pressed the correct one of 2 bars present. After reinforcement, the steady tone changed to a frequency-modulated signal, but by pressing the other bar the tone could be changed back to its steady state and the reinforcement obtained as before. This procedure requires a longer training period before one can actually begin to obtain threshold determinations than the more commonly used avoidance conditioning procedures. However, the procedure reduces the number of animals developing experimental neurosis.—*J. Arbit.*

2718. Olson, Gary, & King, Richard A. (U. North Carolina) Supplementary report: Stimulus generalization gradients along a luminosity continuum. *J. exp. Psychol.*, 1962, 63 (4), 414-415.—A previous study had found relatively flat luminosity generalization gradients in pigeons. The present study, also using pigeons, confirmed that finding at each of 4 levels of training. The finding of higher rates of responding at the lower luminosities also confirms a previous finding and is opposed to the stimulus-intensity-dynamism construct of Hull.—*J. Arbit.*

2719. Tevzadze, V. G. (Baratashvili Pedagogical Inst., Gori, USSR) O differentsirovani intensivnosti i dlitel'nosti labirintnykh razdrazhenii. [Intensity and duration discrimination of labyrinthine stimulation.] *Zh. vyssh. nervn. Deiatel.*, 1961, 11 (6), 1099-1105.—Ss were 2 dogs placed into a swinging box, invented by Khechinashvili, and taught to discriminate between number and duration of swings. The method of alimentary CR was used. It was established that Ss were able to discriminate between labyrinthine stimulations of different intensities and durations.—*A. Cuk.*

LEARNING

2720. Bitterman, M. E. (Bryn Mawr Coll.) Techniques for the study of learning in animals: Analysis and classification. *Psychol. Bull.*, 1962, 59 (2), 81-93.—Present classifications of techniques for the study of animal learning are inadequate. The proposed classification is developed in terms of the functional significance of differences in technique. Thus 2 techniques differ if they yield results which differ in some fundamental respect but may be considered interchangeable if they produce similar results. The 3 major classifications are: Thorndikian Situations, Pavlovian Situations, and Avoidance Situations. Each major classification is subdivided to account for techniques appropriate to the specific situation.—*W. J. Meyer.*

2721. Botwinick, J., Brinley, J. F., & Robbin, J. S. (National Inst. Mental Health) Learning a position discrimination and position reversals by Sprague-Dawley rats of different ages. *J. Gerontol.*, 1962, 17, 315-319.—"Female albino Sprague-Dawley rat Ss in 3 age groups were compared with respect to learning a position response in a single unit Y-maze, learning to reverse the position response,

and the subsequent reversing of the positions." In one experiment, Ss aged approximately 2 yrs. were statistically poorer than Ss aged approximately 10 mos., and Ss aged 3-4 mos. in both the 1st and 2nd reversal tasks, but not in original position learning, or in the 3rd and 4th reversal tasks. In a 2nd experiment, conditions were changed, and no reliable age differences were found.—*J. Botwinick.*

2722. Kardos, Lajos. (U. Budapest) *Tanulás és emberrelválás.* [Learning and anthropogenesis.] *Pszichol. Tanulmányok*, 1958, 1, 41-56.—Analysis of animal maze experiments suggests that a different kinesthetic stimulus does not help the animal to change direction at the same point of the maze and that a different kinesthetic stimulus does not interfere with the learned right choice at any particular point of the maze. Based on his experiments, the writer established the following law: "The law of the approximate equivalence of equiterminal kinesthetic stimulus-variations." Movements which take the animal from the same starting point to the same goal are called equiterminal. The process of anthropogenesis in regard to spatial orientation concludes the paper. (Russian & English summaries)—*E. Friedman.*

2723. Márton, Magda, & Bakay, Éva. (Hungarian Acad. Science) *Fehérpatkányok viselkedésének mennyiségi igazodása egymástól kvantitatív eltérő helyzetekhez a helyzetek sorozatbaágazása esetén az erőadakolási nívó.* [Quantitative adjustment of the behavior of white rats in a series of quantitatively different situations.] *Pszichol. Tanulmányok*, 1958, 1, 127-131.—Experiments during which rats had to leap across a gap with a systematically varying width of 20-40 cm. showed that the length of the leap depended on both the immediate and the preceding task. "The greater the divergence between the effort needed to accomplish the actual task and that needed to accomplish the previous one, the greater the possibility of error and danger quality of the situation. . . . Identical situations, identical both as to need and requirement, evoked different reactions as to achievement and emotional significance depending on the level of effort produced by anterior behavior." (Russian & English summaries)—*E. Friedman.*

2724. Pubols, Benjamin H., Jr. (U. Wisconsin) *Serial reversal learning as a function of the number of trials per reversal.* *J. comp. physiol. Psychol.*, 1962, 55(1), 66-68.—Rats received a total of 410 trials in a Y maze in a position reversal problem. 3 groups were formed, receiving 10, 20, or 40 trials per reversal. The greater the number of trials per reversal, the greater the rate of interreversal learning. However, in terms of total numbers of trials, greater efficiency of performance was achieved with a smaller number of trials per reversal.—*W. A. Wilson, Jr.*

2725. Rice, George E., & Gainer, Priscilla. (Agnes Scott Coll.) *"Altruism" in the albino rat.* *J. comp. physiol. Psychol.*, 1962, 55(1), 123-125.—Rats were confronted with either a squealing rat or a plastic block suspended in a harness. A bar press lowered the stimulus rat (or the block) to the floor. The "distressed" rat was lowered more often than the block, by naive Ss, as well as by Ss that had previously learned (with subsequent extinction) to press the bar to avoid shock.—*W. A. Wilson, Jr.*

2726. Schneirla, T. C. (American Museum Natural History, NYC) *Psychological comparison of*

insect and mammal. *Psychol. Beit.*, 1962, 6(3-4), 509-520.—Comparable differences between worker formica ants and rats are found in the initial learning and in the relearning of a problem with a single choice-point at which competing difficulties and facile alternatives are encountered. Insects and mammals seem to differ markedly in their ability to organize and to reorganize behavior. (French & German summaries)—*H. J. Priester.*

2727. Van Sommers, Peter. (Harvard U.) *Oxygen-motivated behavior in the goldfish, Carassius auratus.* *Science*, 1962, 137 (Whole No. 3531), 678-679.—Goldfish placed in deoxygenated water learned to interrupt a light beam in order to obtain brief exposure to aerated water. The training procedure brought this behavior under the control of arbitrary visual stimuli.—*Journal abstract.*

2728. Wist, Eugene R. *The effect of training level at the time of delay introduction on runway performance.* *USA Med. Res. Lab. Rep.*, 1962, No. 543. 16 p.—Using a factorial design, Ss (rats) were delayed midway down a long runway for 0, 15, or 45 sec. after 0, 15, or 75 training trials without delay. All performance changes for delayed Ss were decremental with higher training level at the time of delay resulting in greater decrements in the runway just posterior to the point of delay. Recovery from the effects of delay occurred for all conditions in spite of continued delay. The results are discussed in terms of frustration-drive, delay of reinforcement, and novelty-reactions models.—*USA MRL.*

Conditioning

2729. Adrianov, O. S. (Inst. Brain, USSR Acad. Medical Sciences, Moscow) *O strukture uslovnykh refleksov na odnovremennyi kompleksnyi razdrazhitel'.* [Structure of conditioned reflexes obtained with a simultaneous complex stimulus.] *Zh. vyssh. nervn. Deiatel.*, 1961, 11(6), 1019-1025.—Motor alimentary conditioned responses were established in 4 dogs using stimuli made up of visual, auditory, and tactile components. The results are compared with conditioned reflexes obtained with simple stimuli. It was found that in the course of elaboration of a simple reflex involving a positive stimulus and an inhibitory stimulus the inhibitory process invariably exerts influence on the excitatory process and vice versa. In case of a systematic extinction of the components of a complex stimulus no inhibition takes place. Extinction of a single component of the complex does not substantially affect the dynamics of the other component.—*A. Cuk.*

2730. Caldwell, D. F., & Werboff, J. (Animal Behavior Lab., Lafayette Clinic) *Classical conditioning in newborn rats.* *Science*, 136 (Whole No. 3522), 1118-1119.—Newborn albino rats were trained according to classical conditioning procedure with 1 of 4 intervals between conditioned and unconditioned stimuli. A vibrotactile stimulus (conditioned stimulus) paired with an electric shock (unconditioned stimulus) was presented to the forelimb 80 times. The results demonstrate that conditioning takes place in newborn rats. However, levels of performance as a function of time intervals between stimuli did not resemble the levels traditionally reported for older animals.—*Journal abstract.*

2731. Gormezano, I., Schneiderman, Neil; Deaux, Edward, & Fuentes, Isreal. (Indiana U.)

Nictitating membrane: Classical conditioning and extinction in the albino rabbit. *Science*, 1962, 138 (Whole No. 3536), 33-34.—The distribution of response latencies and the percentage performance curve of a classical conditioning group, by comparison with a control group, indicated that the extension of the nictitating membrane elicited by a puff of air to the cornea was successfully conditioned to a previously neutral stimulus.—*Journal abstract*.

2732. Guseva, E. G. (Pavlov Inst. Physiology, USSR Acad. Sciences) **Predel vyrabotannogo tormoznogo protsessa u sobak raznogo tipa nervnoi sistemy.** [Limit of inhibitory processes elaborated in dogs of different types of nervous system.] *Zh. vyssh. nervn. Deiatel.*, 1961, 11(6), 1074-1082.—The limit of cortical inhibition in 6 dogs was investigated using differential inhibition in which the intensity of the CS (tone) was gradually increased. The limit varies with the type of nervous system: in dogs of the strong type it is higher than in the dogs of the intermediate type. When the limit of the inhibitory process is exceeded, dogs fall into a neurotic state.—*A. Cuk*.

2733. Khametov, B. G. (Bashkir State U., Ufa, USSR) **K voprosu o peredelke uslovykh refleksov na vremia.** [Transformation of CR using time as CS.] *Zh. vyssh. nervn. Deiatel.*, 1961, 11(6), 1106-1111.—Ss were 3 rabbits. A previously elaborated CR to a complex stimulus was transformed from a 4 minute interval to intervals of 6, 10, 12, 17, and 21 minutes. A definite similarity was found between the transformation of a CR to time and the elaboration of a new CR or a restoration of an old one. The transformation has its own difficulties. One consists in the fact that Ss tend to react to previously elaborated intervals. There seems to be one law which governs the establishment of new reflexes, restoration of old ones, and the transformation of a CR to a time response.—*A. Cuk*.

2734. Kohler, Ivo. (Inst. Experimentelle Psychologie, Innsbruck) **Pavlov and his dog. I. genet. Psychol.**, 1962, 100(2), 331-335.—A delay circuit is presented which serves as an "artificial Pavlovian Dog." A condenser is charged during the initial pairings of the closing of 2 keys such that a "conditioned response" may be subsequently elicited by presenting the "conditioned stimulus" alone. The model is useful in demonstrating that learning of this kind can be mechanically imitated, and does not require the mind.—*Author abstract*.

2735. Movchan, N. P. (Inst. Physiology I. P. Pavlov, Acad. Science, USSR) **K voprosu o razviti zapredel'nogo tromozheniya.** [On the problem of the development of supraliminal inhibition.] *Dokl. Akad. Nauk SSSR*, 1962, 142(1), 245-248.—A report of the development of inhibition of conditioned responses in 3 dogs. UCS was a light pin prick of one front paw. UCR consist of flexing of paw. CS's were a 55 db metronome at a rate of 120/min., a 2000 cps tone at 65 db and at 45 db intensity. CS-UCS interval was 10 secs. Intertrial interval was 3 min. After a stable CR was established to the various CS, inhibition was built up by presenting CS continuously for a long period of time without reinforcement, by increasing intensity of CS to 125 db, and by alternating trials of a normal CS and a high intensity CS. In these cases the CR at first was as strong or stronger than usual but then quickly was reduced in size and in some cases completely disap-

peared. Spontaneous recovery occurred after a rest period of a day and often after the presentation of a weak CS in a series of intense CS's.—*H. Pick*.

(Gor'kii Medical Inst., USSR) **Programmnoe elektronnoe ustroistvo dlia avtomatizatsii opytov po vyrabotke vremennykh svyazei.** [Programmed electronic device for automatization of experiments with conditioning.] *Zh. vyssh. nervn. Deiatel.*, 1961, 11(6), 1134-1136.—Diagram and technical description of an apparatus which makes possible the automatization of CR experiments with animals. The device was used by the authors and gave good results.—*A. Cuk*.

2741. Vasil'eva (Barsukova), Z. A. (Inst. Experimental Medicine, USSR Acad. Medical Sciences, Leningrad) **Vlianie rezkogo usileniia polozhitel'nogo i tormoznogo uslovnogo razdrzhitel'ei na vysshuii nervnuii deiatel'nost' sobak.** [Effect of sharply increased positive and inhibitory CS on the higher nervous activity of dogs.] *Zh. vyssh. nervn. Deiatel.*, 1961, 11(6), 1032-1037.—By means of the Pavlovian method a food CR was established in one dog using light and sound as CS. It was shown that by intensifying an auditory CS a considerable change is produced in the higher nervous activity of dogs. No such change takes place when an inhibitory stimulus is increased. The changes refer to disinhibition of differentiating responses, to decrease in positive CR, and to the onset of sleepiness.—*A. Cuk*.

Discrimination

2742. Honig, Werner K., & Day, Roberta W. (Denison U.) Discrimination and generalization on a dimension of stimulus difference. *Science*, 1962, 138 (Whole No. 3536), 29-31.—4 pigeons were trained to peck at 1 key when 2 identical stimuli were displayed, and at another key when the stimuli were displayed with a wavelength difference of 40 $m\mu$. With stimulus combinations ranging in difference from 0 to 70 $m\mu$ in a generalization test, key preference was a function of the degree of difference between the stimuli.—*Journal abstract*.

2743. Kiriazis, Charles. (Boston U.) Discrimination following various conditions of nondifferential training. *Dissert. Abstr.*, 1961, 22(4), 1264.—*Abstract*.

2744. Libaw, Frieda Bornston. (U. Southern California) The effects of prior part-experiences on visual form perception in the albino rat. *Dissert. Abstr.*, 1961, 22(5), 1724.—*Abstract*.

2745. Riopelle, A. J., Chronholm, J. N., & Addison, R. G. (Yerkes Lab. Primate Biology) Stimulus familiarity and multiple discrimination learning. *J. comp. physiol. Psychol.*, 1962, 55(2), 274-278.—3 groups of monkeys received 10 discrimination problems per day for 60 days; for all groups, 6 of the problems had a stimulus that recurred daily. The Ss quickly learned the reward value of the recurrent stimuli when they were always rewarded (as for 1 group), or never rewarded (as for a 2nd group); the effects of the differential treatment generalized to the daily problems with new stimuli. For the 3rd group, the recurrent stimuli were sometimes rewarded and sometimes not; these animals developed a preference for the familiar stimuli. This last group was most efficient on subsequent discrimination reversal performance.—*W. A. Wilson, Jr.*

2746. Russell, Ian Steele. (Indiana U.) Analysis of responding during operant discrimination. *Dissert. Abstr.*, 1961, 22(6), 2065.—*Abstract*.

2747. Schusterman, Ronald J. (Emory U.) Transfer effects of successive discrimination-reversal training in chimpanzees. *Science*, 1962, 137 (Whole No. 3528), 422-423.—Chimpanzees receiving successive discrimination-reversal training on a single pair of stimuli transferred almost perfectly to 2 additional reversal tasks and to a "learning-set" series of 180 discrimination problems. A "win-stay, lose-shift" strategy, however it is acquired, seems to be a sufficient basis for 1-trial discrimination learning.—*Journal abstract*.

2748. Warren, J. M., & Warren, Helen B. (Pennsylvania State U.) Reversal learning by horse and raccoon. *J. genet. Psychol.*, 1962, 100(2), 215-220.—A raccoon and 2 horses were tested on serial reversals of a positional discrimination. A rapid decline in the number of errors made on consecutive reversals was observed in all 3 animals. Improvement in the rate of interreversal learning on simple discriminations does not correlate with taxonomic status or ability to solve more complex problems within the series of mammals studied. However, all mammals tested on this task "learn to learn," but fish and invertebrates do not.—*Author abstract*.

2749. Yagi, Ben. (U. Tokyo) The effect of motivating conditions on the estimation of time in rats. *Jap. J. Psychol.*, 1962, 33(1), 8-24.—An in-

vestigation of the influence of various conditions of food deprivation in combination with varying times in a detention compartment on the rat's ability to estimate time spent in the detention compartment after having been trained to discriminate right and left turning responses as a function of time interval. In general, changes in conditions of motivation did affect estimation of time so that time was estimated to be longer under conditions of deprivation.—*A. Barclay*.

Avoidance

2750. Berryman, Robert. (Columbia U.) A technique for the experimental analysis of conflict. *Psychol. Rep.*, 1962, 10(2), 423-426.—"An analytic description is given of the acquisition and stable state performance of albino rats in a continuous double approach-avoidance conflict situation. Responding on one lever produced regular water reinforcement and a shock which increased step-wise with each response; a response on a second lever reset the shock to its initial value."—*B. J. House*.

2751. Elder, Thomas. (Tulane U., School of Medicine) Correlation of two measures of the strength of an approach-avoidance conflict. *Psychol. Rep.*, 1962, 10(2), 510.—For 38 rats on a runway problem, number of trials required to recover the approach component of a previously acquired approach-avoidance conflict correlated $-.50$ with mean distance traveled down the runway on successive trials during the recovery series, as predicted by Miller's approach-avoidance conflict model.—*B. J. House*.

2752. Evans, Wayne O. (USA Medical Research Lab., Fort Knox, Ky.) Producing either positive or negative tendencies to a stimulus associated with shock. *J. exp. Anal. Behav.*, 1962, 5(3), 335-337.—"A technique is described in which rats are pretrained with reinforcement to bar press. Each bar press was associated with a tone. This tone was later paired with one of two aspects of an electric shock, either at the onset or at the end of the shock, in a situation in which the shock is inescapable. These animals were retested in the operant situation under conditions of extinction, but with tone present as a conditioned reinforcer. The finding was that animals for which the tone was associated with shock onset extinguished quickly, whereas animals for which the tone was paired with shock termination extinguished more slowly."—*J. Arbit*.

2753. Flakus, Walter Joseph. (U. Buffalo) The acquisition of two different shock-avoidance responses to two different initially neutral stimuli. *Dissert. Abstr.*, 1961, 22(4), 1263.—*Abstract*.

2754. Fromer, Robert. (Yale U.) The effect of several shock patterns on the acquisition of the secondary drive of fear. *J. comp. physiol. Psychol.*, 1962, 55(1), 142-144.—Rats were exposed to inescapable shock, and then tested for fear of the compartment in which they had been shocked. Groups of animals received different patterns of shock, and less fear was seen when the shock stimulus had had a gradual onset than when it had had a sudden onset. The results "are compatible with explanation of the failure to produce a secondary drive based upon hunger in terms of the gradual onset of hunger."—*W. A. Wilson, Jr.*

2755. Hoffeld, Donald R. (Louisiana State U.) Primary stimulus generalization and secondary ex-

tion as a function of strength of conditioning. *J. comp. physiol. Psychol.*, 1962, 55(1), 27-31.—Cats were trained to turn a wheel to a 250 cps tone in order to avoid shock. Groups varied in strength of conditioning, and in the nature of the generalization and extinction procedures used. Relative generalization (to 500 or 2000 cps) decreased with the strength of conditioning. Secondary extinction occurred when animals were 1st extinguished on a generalization tone, but relative secondary extinction did not vary with strength of conditioning or the difference of the generalization tone from the original tone, contrary to the Hullian model of conditioned inhibition.—*W. A. Wilson, Jr.*

2756. Howard, Thomas C. (U. Tulsa) Conditioned temperature drive in rats. *Psychol. Rep.*, 1962, 10(2), 371-373.—"Three groups of animals [of 10 each] were trained to escape from a cold box through a vertical hole to room temperature. Animals trained at 20° escaped more rapidly than animals trained at 40°, and both groups escaped more rapidly than animals trained at 75°. During testing, all animals were placed in a box at 75° and allowed to escape. The 20° animals escaped most rapidly, followed by the 40° animals, and finally the 75° animals. The difference between the groups were significant and presumably demonstrate that the temperature drive can be externalized in a fashion analogous to fear."—*B. J. House.*

2757. Hunter, George Fred. (U. Pennsylvania) The discriminative and secondary reinforcing functions of a stimulus associated with shock termination. *Dissert. Abstr.*, 1961, 22(4), 1264.—*Abstract.*

2758. King, John A. (Jackson Memorial Lab.) Swimming and reaction to electric shock in two subspecies of deer mice (*Peromyscus maniculatus*) during development. *Anim. Behav.*, 1961, 9(3-4), 142-150.—A total of 320 *P. m. gracilis* and *P. m. bairdii* were studied in longitudinal and cross-sectional groups. At 12-22 days *gracilis* were slower to escape from water than *bairdii* but later performed like them. *Bairdii* escaped from a charged grid to a safe corner for longer periods than *gracilis*. With experience, *bairdii* performance improved but *gracilis* did not. Data are discussed in terms of genetic, maturational, and learning effects.—*W. J. Coppock.*

2760. Myers, Arlo K. (U. California, Riverside) Effects of CS intensity and quality in avoidance conditioning. *J. comp. physiol. Psychol.*, 1962, 55(1), 57-61.—Groups of rats were trained in a wheel-turning shock-avoidance task and a pseudoconditioning control situation with CSs of different intensities of tone and buzzer. Both buzzer intensities (65 and 85 db.) produced more conditioned responses than any tone intensity (60, 80, and 100 db.). Pseudoconditioning was produced in groups receiving the buzzer, but not in a tone pseudoconditioning group. The behavior of the buzzer conditioning groups is presumably partially, but not wholly, explicable on the basis of pseudoconditioning.—*W. A. Wilson, Jr.*

2761. Noblin, Charles D., & Maher, Brendan A. (Louisiana State U.) Temporal and physical fac-

tors in avoidance reduction. *J. comp. physiol. Psychol.*, 1962, 55(1), 62-65.—Extinction of the avoidance component of an approach-avoidance conflict was attained more rapidly in a group of rats that started extinction training on an average of 9 days after acquisition than in a group extinguished immediately after training. Animals that were run to extinction in the same alley as that of original conflict training required no more trials than animals run first to extinction in a different alley. It is suggested that time-related variables may have confounded previous displacement studies.—*W. A. Wilson, Jr.*

2762. Wallgren, Henrik, & Savolainen, Sinikka. (Research Lab., State Alcohol Monopoly, Helsinki, Finland) Modification of shuttle box to improve rate of avoidance learning in rats. *Scand. J. Psychol.*, 1962, 3(2), 78-80.—Acquisition by rats of a conditioned avoidance response seems to be retarded in an ordinary shuttle-box by the necessity to reenter the compartment where shocks have previously been received. To avoid this, a 4-compartment box was introduced in which the animals can proceed in 1 direction. Rats were given either continuous trials until 9 avoidance responses were made during 10 consecutive trials, or 30 trials per day until 27 correct responses were made during 1 session. With both methods of training, the rate of learning was approximately 40% more rapid in the 4-compartment box than in the ordinary shuttle-box.—*Journal abstract.*

2763. Weissman, Albert (Charles Pfizer) Non-discriminated avoidance behavior in a large sample of rats. *Psychol. Rep.*, 1962, 10(2), 591-600.—"Stable nondiscriminated avoidance behavior was studied in a sample of 32 rats. Marked intrasubject stability and intersubject variability arose in several measures of avoidance behavior. Frequency distributions of mean response and shock rates were skewed to the right. . . . Inspection of cumulative response curves revealed clear qualitative differences between rats. The results point out the difficulty of choosing truly 'representative' Ss, and in generalizing from the data of small samples of rats trained on nondiscriminated avoidance."—*B. J. House.*

Reinforcement

2765. Andronico, Michael P., & Forgays, Donald G. (Rutgers U.) Sensory stimulation and secondary reinforcement. *J. Psychol.*, 1962, 54(1), 209-219.—This experiment tested the hypothesis that so-called "neutral" cues employed in current studies of secondary reinforcement are not neutral but may be reinforcing in their own right. The results in general confirm the hypothesis and suggest a source of error which must be taken into account in such experimentation.—*Author abstract.*

2766. Appel, James B., & Hiss, Richard H. (Yale U.) The discrimination of contingent from noncontingent reinforcement. *J. comp. physiol. Psychol.*, 1962, 55(1), 37-39.—Responses of pigeons to a key were reinforced on an FI 4 min. schedule when the key was red; when it was white, response-independent reward was given every 4 min. Rates

indicated that discrimination between the conditions was possible, although the distribution of responses during the noncontingent condition was similar to that obtained during FI reinforcement.—*W. A. Wilson, Jr.*

2767. Capaldi, E. J. (U. Texas) **A comment on Wike's rejoinder.** *Psychol. Rep.*, 1962, 10(2), 482.—Further discussion (see 37: 2787) of a study on partial and delayed reinforcement.—*B. J. House.*

2768. Davenport, John W. (Amherst Coll.) **The interaction of magnitude and delay of reinforcement in spatial discrimination.** *J. comp. physiol. Psychol.*, 1962, 55(2), 267-273.—Rats were given choices between 2 pellets at a 1-sec. delay of reinforcement, and a larger amount of reward with a longer delay. 3 levels of magnitude and 6 levels of delay were used in a factorial design. From the measures of preference, conflict behavior, and speed, equal-reinforcement contours could be derived, "which indicated that a unit increase in delay can be balanced by a log unit increase in magnitude."—*W. A. Wilson, Jr.*

2769. Dews, P. B. (Harvard Medical School) **The effect of multiple S^A periods on responding on a fixed-interval schedule.** *J. exp. Anal. Behav.*, 1962, 5(3), 369.—"The effects of repeated interruption of FI responding by short S^A presentations on the pattern of increasing frequency of responding through the interval has been studied. Although the S^A profoundly changed the pattern of responding during their presentation, the general scalloped pattern of FI responding survived. The implication of these findings for understanding the role of chaining of responses in FI patterns is discussed. It is suggested that chaining is not a necessary condition for the scalloped pattern."—*J. Arbit.*

2772. Hanson, H. M., Campbell, E. H., & Witoslawski, J. J. (Merck Inst. Therapeutic Research, West Point, Pa.) **FI length and performance on an FI FR chain schedule of reinforcement.** *J. exp. Anal. Behav.*, 1962, 5(3), 331-333.—"In a chained FI FR schedule, manipulating the length of the FI component produced changes confined almost entirely to the FI performance; increasing the interval length increased the total number of responses emitted per reinforcement. The configuration of the fixed-interval scallop was clearly modified as the interval length was increased, with the larger intervals becoming flatter (i.e., a larger proportion of the total responses earlier in an interval). Measurement of the postreinforcement pause is suggested as a possible indicator of fixed-interval scalloping."—*J. Arbit.*

2773. Hurwitz, H. M. B. (Birkbeck Coll., London, England) **Frequency of reinforcement and preliminary training conditions as determinants of extinction.** *Psychol. Rec.*, 1961, 11, 395-403.—"The correlation of two variables, the number of reinforcements during preliminary training sessions and the number of reinforcements during lever-pressing

training sessions, with a measure of response-chain conditioning, was investigated. . . . Two responses were recorded (a) a lever-pressing response; (b) a tray-contact response. Preliminary training sessions consisted in reinforcing tray-contact responses only; lever-pressing training consisted in presenting the reinforcer after a lever press was followed by a tray response." Under extinction the relation between extinction score and frequency of reinforcement was influenced by the amount of preliminary reinforcement.—*R. J. Seidel.*

2774. Hurwitz, H. M. B. (Birkbeck Coll.) **Some properties of behaviour under fixed ratio and counting schedules.** *Brit. J. Psychol.*, 1962, 53(2), 167-173.—The effects on rate of response and on a measure of the sequential properties of the response array of 2 reinforcement schedules, specified in terms of 2 response classes, lever pressing and tray responding, were investigated. Observations were made under conditioning and extinction. Under both conditions animals (rats) trained by the counting procedure responded at a consistently higher rate but received fewer reinforcements. The results are discussed with reference to 2 maze-running procedures and to double alternation studies.—*Journal abstract.*

2775. Karsh, Eileen B. (Swarthmore Coll.) **Effects of number of rewarded trials and intensity of punishment on running speed.** *J. comp. physiol. Psychol.*, 1962, 55(1), 44-51.—In 3 experiments, rats were trained to run down an alley for food; on later trials both electric shock and food were delivered at the goal. Asymptotic running speed after shock was imposed, was a function of the intensity of the shock, and was not clearly affected by the number of food-alone training trials that had been given. The effect of shock was always greatest on running speed near the goal, leading to gradients consistent with Miller's conflict theory.—*W. A. Wilson, Jr.*

2776. Keehn, J. D. (American U. Beirut, Lebanon) **The effect of post-stimulus conditions on the secondary reinforcing power of a stimulus.** *J. comp. physiol. Psychol.*, 1962, 55(1), 22-26.—A tone (S) was established as a secondary reinforcer for rats by making it the discriminative stimulus for a response (R_1) which was reinforced with water. When S was used as a secondary reinforcer for a new response (R_2), its effectiveness was greater when R_1 followed S (R_2 -S- R_1) than when a new response was required after S (R_2 -S- R_x). It was suggested that "secondary reinforcers facilitate performance rather than strengthen associations."—*W. A. Wilson, Jr.*

2777. Logan, Frank A., & Gonzalez, Louis M. (Yale U.) **Supplementary report: Shift from non-reward to negatively correlated reward.** *J. exp. Psychol.*, 1962, 63(4), 416.—An earlier study found that rats that had first run with reward uncorrelated with speed learned to run slowly, as easily as naive rats, when reward was forthcoming only if they took longer than a specified time to run the alley. Rats that had been run without reward seemed to have unusual difficulty in adjusting to such a condition. The present study, using speed of running an alley, found that the experience of nonreward does not affect adjustment to conditions of negatively correlated reward.—*J. Arbit.*

2778. Pubols, Benjamin H., Jr. (U. Wisconsin) **Constant versus variable delay of reinforcement.**

J. comp. physiol. Psychol., 1962, 55(1), 52-56.—Rats were run in a Y maze; responses to one side were followed by food after a constant d sec. of delay, while responses to the other side were rewarded after delays of either 0 or 2d sec., presented in a random sequence. A preference for the variable-delay side developed, and developed more rapidly the larger the value of d, confirming predictions which were derived from the assumption of a negatively accelerated gradient of reinforcement.—*W. A. Wilson, Jr.*

2780. Ross, Leonard. (U. Wisconsin) The effect of equal reinforcement of the positive and negative discriminanda of a learned discrimination. *J. comp. physiol. Psychol.*, 1962, 55(2), 260-266.—Rats were trained on a black-white discrimination, and then received a long series of forced trials, $\frac{1}{2}$ to black and $\frac{1}{2}$ to white. On forced trials, both discriminanda received 100% reinforcement (1 experiment) or 50% random reinforcement (another experiment). After this training, the rats were trained on the original problem or its reverse. Speed and error measures indicated that the original discrimination was retained over the equal-reinforcement interval in both experiments.—*W. A. Wilson, Jr.*

2781. Schrier, Allan M. (Brown U.) Response latency of monkeys as a function of reward amount and trials within test days. *Psychol. Rep.*, 1962, 10(2), 439-444.—In 3 experiments (N=34) monkeys were trained to displace a single object for food reward. In each experiment, response latency was shorter for a group rewarded with 8 pellets than with 1 pellet, but a statistically significant difference was found only when the ratio was raised to 32:1 for the 2nd phase of one experiment. "A progressive increase in response latency within test days was obtained in the experiment in which the inter-trial interval was 30 sec., but not in the two in which the interval was 1 min. An initial warm-up effect within days, reported in earlier studies, was obtained, but tended to diminish as training progressed."—*B. J. House.*

2782. Segal, Evalyn F. (San Diego State Coll.) Prolonged extinction following one session of food-reinforced conditioning: A methodological note. *J. comp. physiol. Psychol.*, 1962, 55(1), 40-43.—"Number of bar presses [by rats] during 30 operant-level sessions was compared with the number during 30 extinction sessions, following a single light-reinforcement test and one session of food-reinforced conditioning, at two deprivation levels. Two of three measures of group responding remained above operant levels throughout extinction sessions."—*W. A. Wilson, Jr.*

2783. Siegal, Phillip Gerald. (New York U.) The effect of varying acquisition trials and extinction trials on the relearning of a maze habit. *Dissert. Abstr.*, 1961, 22(5), 927.—*Abstract.*

2784. Stebbins, William C. (Hamilton Coll.) Response latency as a function of amount of reinforcement. *J. exp. Anal. Behav.*, 1962, 5(3), 305-307.—"Food-deprived rats were trained to press and hold down a telegraph key in the presence of a

light. Subsequent release of the key during a tone was followed by 0.15 ml of a 20-percent sucrose solution as reinforcement. The Ss were subsequently shifted to a 0-percent and to a 5-percent solution from the 20-percent base line. The median RT and the variability of RT increased markedly as a result of the shift to the lower sucrose concentrations. For all Ss, the change in median and variability was greater for the shift to the 0-percent solution than for the shift to the 5-percent solution. It is probable that median RT and variability of RT are inversely related to amount of reinforcement."—*J. Arbit.*

2785. Stebbins, William C., & Lanson, Robert N. (Hamilton Coll.) Response latency as a function of reinforcement schedule. *J. exp. Anal. Behav.*, 1962, 5(3), 299-304.—"Four Ss [rats] were trained to press and hold down a telegraph key in the presence of a light. Subsequent release of the key during a tone was followed by water reinforcement. The schedule of reinforcement for key release was varied, and its effects on the latency (RT) of key release to the tone were studied. Both median RT and variability of RT were found to be inversely related to frequency of reinforcement as determined by the schedule."—*J. Arbit.*

2786. Symmes, David, & Leaton, Robert N. (Yale U.) Failure to observe reinforcing properties of sound onset in rats. *Psychol. Rep.*, 1962, 10(2), 458.—Operant conditioning procedures previously shown to produce learning with dim light onset as reinforcement were ineffective in training 33 rats with auditory stimulus (pure tone, white noise, or warbling tone at 70-db. or 50-db. human sensation level) as a reinforcement.—*B. J. House.*

2787. Wike, Edward L. (U. Kansas) On partial and delayed reinforcement: A rejoinder. *Psychol. Rep.*, 1962, 10(2), 481.—A consideration of comments by Capaldi (see 37: 432) in answer to previous criticisms by Wike (see *Psychol. Rep.*, 1961, 9, 456).—*B. J. House.*

2788. Wilson, J. J. (New York U. Medical Center) Photic reinforcement as a function of optimal level of stimulation. *Psychol. Rec.*, 1962, 12, 17-23.—In 4 experiments with rats of Sprague-Dawley strain in a double-lever situation the results showed a preference for pressing the bar which led to 3mL increase. This preference was independent of novelty and deprivation effects as well as initial condition of lighting in chamber (darkness or 3mL).—*R. J. Seidel.*

Motivation & Learning

2789. Crocetti, Carlo P. (Rome Air Development Cent.) Drive level and response strength in the bar-pressing apparatus. *Psychol. Rep.*, 1962, 10(2), 563-575.—72 rats were divided into 6 groups, equated on the basis of operant level responding after 22 hr. food deprivation. Each group was assigned to a different drive level: 1, 4, 7, 16, 22 hr. food deprivation or 22 hr. food plus 15 hr. water deprivation. All Ss had the following sequence of experimental operations: operant level determination at assigned drive, conditioning at 7 hr. food deprivation, 5 days extinction under assigned drive, and 3 days further extinction at 22 hr. food deprivation. Results showed extinction responding to be a linear function of drive measured by unconditioned rate of respond-

ing. This relationship was not affected by drive present during training nor by addition of an "irrelevant" drive. An increase in drive during extinction did not increase rate of responding beyond that of a control group extinguished throughout under the higher drive. Results were related to theories of Hull and Skinner.—*B. J. House.*

2790. Erlebacher, Albert. (U. Wisconsin) **Reversal learning in rats as a function of percentage reinforcement and degree of overlearning.** *Dissert. Abstr.* 1961, 22(6), 2075.—*Abstract.*

2791. Lana, Robert E. (Alfred U.) **Exploration phenomena and the drive-reduction hypothesis.** *J. gen. Psychol.*, 1962, 67, 101-104.—The conditions necessary for an examination of the drive-reduction hypothesis when exploratory phenomena are involved are enumerated, and the similarities between exploration and the appetitive drives noted. The author concludes that the operation of satiation of an animal with novel stimuli would have to be demonstrated for support of the drive-reduction hypothesis in this situation. Most current studies do not contain the test conditions to allow for this conclusion.—*Author abstract.*

2792. Loeb, Janice May. (U. Texas) **The role of taste stimulation in the prefeeding effect.** *Dissert. Abstr.*, 1961, 22(6), 2080-2081.—*Abstract.*

2793. Ramond, Charles Knight, II. (State U. Iowa) **Performance in selective learning as a function of hunger.** *Dissert. Abstr.*, 1961, 22(4), 1266.—*Abstract.*

2794. Thomas, David Rolf. (Duke U.) **Stimulus generalization and operant discrimination as a function of level of motivation.** *Dissert. Abstr.*, 1962, 22(12), 4419-4420.—*Abstract.*

2795. Walker, Edward L., & Motoyoshi, Ryoji. (U. Michigan) **The effects of amount of reward and distribution of practice on active and inactive memory traces.** *J. comp. physiol. Psychol.*, 1962, 55(1), 32-36.—A larger proportion of rats that received 8 pellets of food in a T-maze alternated than of rats that received 1 pellet. Subsequently all animals were given 2 learning trials per day. A Spaced Group received one trial per 12 hr.; a Massed Group had one pair of trials per day separated by a 30-sec. interval. The Massed Group alternated more, and analysis suggests that "most of the apparent loss in learning efficiency in the massed condition may be attributed to alternation rather than to slower accumulation of habit strength."—*W. A. Wilson, Jr.*

2796. Wehling, Hildegard E., & Prokasy, William F. (Pennsylvania State U.) **Role of food deprivation in the acquisition of the observing response.** *Psychol. Rep.*, 1962, 10(2), 399-407.—25 rats with either 12-hr. or 20-hr. food deprivation were run on a T maze with 50% food reinforcement on either arm. Entry into a black or white goal box was preceded by 20 sec. detention in a matching delay chamber. Black and white appeared equally often on the left and right. On the consistent side, food was always paired with a given brightness, while on the inconsistent side black and white were associated randomly with reward. The high drive group developed a significantly greater preference for the consistent side than did the low drive group. Results are discussed in relation to observing response theory.—*B. J. House.*

COMPLEX PROCESSES

2797. Behar, Isaac. **Evaluation of cues in learning set formation in mangabeys.** *USA Med. Res. Lab. Rep.*, 1962, No. 534. 9 p.—6 naive sooty mangabeys were given 300 serial object discrimination problems. 6 problems were presented daily of which 2 each lasted 4, 7, and 10 trials. Following the discrimination trials of each problem, a "critical trial" was given in which either the positive or the negative stimulus was paired with a neutral stimulus. Learning sets were established at about the same rate as that previously obtained in macaques, and showed the usual characteristics. Responses on the critical trials indicated the development of both approach and avoidance tendencies, although the former largely exceeded the latter. This difference was interpreted in terms of the disparate frequency of response to the positive and negative stimuli during the discrimination trials. In general, the sooty mangabey appears to be a very suitable S for behavioral research.—*USA MRL.*

2798. McDowell, A. A., Brown, W. Lynn, & McTee, A. C. (U. Texas) **Sex as a factor in delayed-response and reduced-cue discrimination learning by previously irradiated monkeys.** *J. genet. Psychol.*, 1962, 100(2), 325-329.—40 male and 24 female rhesus monkeys, ranging in age from 30 to 42 months, that had previously been exposed to varying dosages of nuclear radiation, were compared with respect to learning performance on delayed-response and reduced-cue discrimination tasks. Statistical analysis of the error data yielded the following results: (a) the female Ss improved performance significantly faster than did the male Ss on reduced-cue discrimination learning, and (b) Performance of the female Ss on delayed-response training was significantly superior to that of male Ss, although rate of improvement with practice did not differentiate the sexes.—*Author abstract.*

2799. Markova, A. YA. (Moscow, USSR) **Protssess elementarnoi abstraktsii u nizshikh obez'yan.** [Process of elementary abstraction in the lower apes.] *Vop. Psikhol.*, 1962, No. 1, 121-133.—In order to study the ability of rhesus monkeys to abstract cues a preference method was used. The preference in a 2 alternative choice situation was determined for 3 solid geometric forms: sphere, cube, and pyramid. Preference was then tested with 2 dimensional cutouts of the projections of these objects, with 2 dimensional plane drawings on a background, with outline drawings of the plane projections, and with dotted line outline drawings. In all cases the preferences displayed originally held up but degree of preference grew somewhat less as the stimuli got further away from the original objects. The preferences generally held up in spite of change of color or orientation.—*H. Pick.*

2800. Mason, William A., & Berkson, Gershon. (Yerkes Lab. Primate Biology, Orange Park, Fla.) **Conditions influencing vocal responsiveness of infant chimpanzees.** *Science*, 1962, 137(Whole No. 3524), 127-128.—Infant chimpanzees were tested to determine the effects on distress vocalizations (whimpering, screaming) of stimulus conditions approximating the physical relationship to the mother. Under such conditions spontaneous vocalizations were infrequent, and vocal responsiveness to a painful stimulus was substantially reduced.—*Journal abstract.*

2801. Shorey, H. H. (U. California, Riverside) **Nature of the sound produced by *Drosophila melanogaster* during courtship.** *Science*, 1962, 137 (Whole No. 3531), 677-678.—The wing vibrations of courting male *Drosophila melanogaster* Meigen produced pulsations of sound, with each pulse apparently caused by 1-2 cycles of wing movement. The average repetition rate at 25° C was 29.8 pulses per second. The rate was dependent on temperature, increasing at 1.4 pulses per additional degree Celsius.—*Journal abstract*.

SOCIAL BEHAVIOR

2802. Baron, Alan; Kish, George B., & Antonitis, Joseph J. (U. Maine) **Effects of early and late social isolation on aggregative behavior in the domestic chicken.** *J. genet. Psychol.*, 1962, 100 (2), 355-360.—A test of the hypothesis that aggregative behavior in domestic chickens may be acquired only during a critical period early in life and that such learning is not subject to the influences of subsequent social experiences. Groups of animals were reared for the first 10 weeks of life under 3 conditions: (a) in social contact with other chickens throughout, (b) in social contact with other chickens for the 1st week, and in social isolation for the next 9 weeks, and (c) in social isolation for the 1st week and in social contact for the next 9 weeks. Observations of the social reactivity of each S to a stimulus animal of the same age were conducted at 5 and 10 weeks of age. The results could not be interpreted as supporting the critical hypothesis. It was concluded that the effects of early isolation or social contact may be modified by later social experiences. Social isolation following an early period of social contact reduces the effects of early social contact. Social contact following an early period of social isolation reduces the effects of early social isolation after short periods of social contact but may magnify these effects after longer periods of social contact.—*Author abstract*.

2803. Eleftheriou, Basil, E., & Bronson, F. H. (Roscoe B. Jackson Memorial Lab., Bar Harbor, Me.) **Interaction of olfactory and other environmental stimuli on implantation in the deer mouse.** *Science*, 1962, 137 (Whole No. 3533), 764.—Recently inseminated female deer mice were exposed to changes in physical environment, including size of available space, newness of environment, and a stud or strange male in order to test the hypothesis that a strange male decreases the incidence of pregnancy in recently inseminated females (Bruce effect). The data confirm the Bruce effect but also indicate that changes in physical environment produced great effects on implantation in recently inseminated females.—*Journal abstract*.

2804. Guiton, Philip. (Edinburgh, Scotland) **The influence of imprinting on the agonistic and courtship responses of the brown leghorn cock.** *Anim. Behav.*, 1961, 9(3-4), 167-177.—Chicks were imprinted on Days 2 through 5 after hatching to 1 of 2 moving, clucking, models which had little resemblance to fowl. Other chicks were habituated to the test situation with or without the model when 6 weeks old. Trained birds tended to follow the models until 8-12 weeks old. The effect was less with age and less in birds imprinted in groups. Habituated birds did not follow. At 6 weeks imprinted birds begin to aggress against the models and showed sexual display.

2 birds continued to respond by "waltzing" to the training model up to 14 months but when given a choice they reacted to a stuffed bird rather than the model.—*W. J. Coppock*.

2805. Jensen, Gordon D., & Tolman, Charles W. (U. Washington) **Mother-infant relationship in the monkey, *Macaca nemestrina*: The effect of brief separation and mother-infant specificity.** *J. comp. physiol. Psychol.*, 1962, 55(1), 131-136.—Observation of 2 mother-child pairs of *Macaca nemestrina* led to the conclusions: "1. Infant-directed behavior of mothers appears to be generally own-infant-specific. 2. Infants are not absolutely mother-specific, but they learn to be so after repeated separation and interaction with a strange mother. 3. Separation serves to increase the infant-directed behavior of the mother toward her own infant and the mother-seeking behavior of the infant for an initial period after they are reunited."—*W. A. Wilson, Jr.*

2806. Leary, R. W., & Maroney, R. J. (U. Oregon) **The effect of home-cage environment on the social dominance of monkeys.** *J. comp. physiol. Psychol.*, 1962, 55(2), 256-259.—Adolescent monkeys were tested in pairs on dominance in food-getting in the Wisconsin General Test Apparatus (WGTA). Then 1 monkey was placed in the home cage of another for 48 hrs. Dominance testing in the home cage and the WGTA during this period showed an increase in relative dominance of the hosts. This change was often maintained in WGTA tests a week later.—*W. A. Wilson, Jr.*

2807. Miller, Robert E., & Banks, James H., Jr. (U. Pittsburgh) **The determination of social dominance in monkeys by a competitive avoidance method.** *J. comp. physiol. Psychol.*, 1962, 55(1), 137-141.—Rhesus monkeys learned to mount a perch large enough for only one animal in order to avoid shock, and then were tested in pairs. Dominance hierarchies thus obtained were very stable over long periods of time, being less subject than food-getting measures to variations due to momentary distraction or lack of motivation.—*W. A. Wilson, Jr.*

2808. Rosenblum, Leonard Allen. (U. Wisconsin) **The development of social behavior in the rhesus monkey.** *Dissert. Abstr.*, 1961, 22(3), 926.—*Abstract*.

ABNORMAL BEHAVIOR

2809. Calhoun, John B. **Population density and social pathology.** *Scient. American*, 1962, 206(2), 139-150.—When a population of laboratory rats is allowed to increase in a confined space, the rats develop acutely abnormal patterns of behavior that can even lead to the extinction of the population. In time, refinement of experimental procedures may advance our understanding to the point where they may contribute to the making of value judgments about analogous problems confronting the human species.—*L. A. Waack*.

2810. Rudenko, L. P. (Inst. Higher Nervous Activity, USSR Acad. Sciences) **K voprosu o voz-nikovenii "bol'nogo izolirovannogo punkta" v slukhovom analizatore sobaki.** [Origin of the "pathological isolated point" in the dog's auditory analyzer.] *Zh. vyssh. nervn. Deiatel.*, 1961, 11(6), 1094-1098.—An unsuccessful attempt was made to induce experimental neurosis in one dog of the strong unequilibrated type of nervous system. One year

after this experiment the animal started to manifest—against a background of physical deterioration—a weakening of the nervous system particularly in the acoustic area which had been acted upon previously by the pathological agent. Pathological weak points seem to exist in the cortex in a potential state and manifest themselves under conditions that are unfavorable to the organism without any additional pathological influences.—A. Cuk.

2811. Vavilova, N. M., Kliavina, G. A. Obraztsova, G. A., & Troshikhin, V. A. (Pavlov Inst. Physiology, USSR Acad. Sciences) O sootnoshenii tipologicheskikh svoistv vysshei nervnoi deiatel'nosti i techeniia patologicheskikh protsessov. [Relationship between typological properties of the higher nervous activity and the course of pathological processes.] *Zh. vyssh. nervn. Deiatel.*, 1961, 11(6), 1038-1043.—The purpose was to study the susceptibility to infection and cancer of 9 dogs who have been subjected to an experimental neurosis, and of 12 rabbits of different nervous types. Passive-defensive reactions to food were induced in all animals. Many relationships were established between the stability of such reaction, susceptibility to infection, and the course of a cancerogenous process, on the one hand, and the basic properties of the higher nervous activity, on the other.—A. Cuk.

2812. Vernadakis, Antonia. (U. Utah College Medicine) Spinal cord convulsions in developing rats. *Science*, 1962, 137(Whole No. 3529), 532.—Tonic hind-limb convulsions were elicited by electrical stimulation of the spinal cord. The flexor-extensor pattern characteristic of adult animals was observed in rats as young as 1 day old.—*Journal abstract*.

2813. Werboff, Jack, & Corcoran, John B. Audiogenic seizures and sensitivity to peripheral shock. *Psychol. Rep.*, 1962, 10(2), 523-526.—2 groups of 50 rats each, separated on the basis of susceptibility to audiogenic seizure, were trained to escape shock by jumping a barrier and then tested with varying shock levels. Seizure-prone rats showed emotional responses at lower shock levels than resistant rats, but the groups did not differ in escape training latency or escape threshold. Findings were related to previous studies showing that higher emotionality in seizure-prone rats can interfere with learning performance.—B. J. House.

DEVELOPMENTAL PSYCHOLOGY

2814. Ausubel, David P., & Fitzgerald, Donald. (U. Illinois) Meaningful learning and retention: Intrapersonal cognitive variables. *Rev. educ. Res.*, 1961, 31(5), 500-510.—"By cognitive structure is meant an individual's organization, stability, and clarity of knowledge in a particular subject-matter field relative to meaningful new learning tasks in this field. In the more general and long-term sense, cognitive structure variables refer to the influence of significant organizational properties of the learner's total knowledge in this subject-matter field on his future academic performance in the same area. In the more specific and short-term sense, cognitive structure variables refer to the effects of the organizational properties of just the immediately relevant concepts within a particular subject-matter field on the learning and retention of small units of related subject matter. The importance of cognitive struc-

ture variables has been generally underestimated in the past." (43 ref.)—F. Goldsmith.

2815. Baller, Warren R. (U. Nebraska) Readings in the psychology of human growth and development. New York: Holt, Rinehart & Winston, 1962. xiv, 689 p. \$4.75.—"This book of readings was planned to serve as a companion-piece to *The Psychology of Human Growth and Development* by Warren R. Baller and Don C. Charles" (see 36: 3FA32B). The papers have been organized into 4 major topic areas: "Orientation to the Study of Human Behavior and Development," "The Bio-social Foundations of Human Behavior," "Development and Adjustment," and "Personality and the School's Role in Its Development."—W. J. Meyer.

2816. Eichorn, Dorothy H., & Bayley, Nancy. (U. California, Berkeley) Growth in head circumference from birth through young adulthood. *Child Develpm.*, 1962, 33(2), 257-271.—"Longitudinal measurements of the head circumference of a group of healthy persons from birth through early adulthood are reported. The mean head circumference of males exceeds that of females at all ages. The rate of increase in head circumference is greater in males from birth through 15 months and in females from the second through the twelfth year. Increase in head circumference continues for a longer period in males, at least through 21 years, and possibly further into the third decade. The rate of deceleration in growth in head circumference is most marked during the first 6 months. The existence of an adolescent growth spurt in head circumference is strongly supported."—W. J. Meyer.

2817. McVarish, Donald. (U. California, Berkeley) Tables for computing decimal fractions of a year. *Child Develpm.*, 1962, 33(2), 477-480.—Tables are presented which give exact decimal equivalents of a year to 4 places between any 2 dates.—W. J. Meyer.

2818. Nemes, Livia. Az értelmi fejlődés és a gondolkodás Piaget műveiben. [The phases of mental development and thinking in Piaget's works.] *Pszichol. Tanulmányok*, 1958, 1, 27-37.—Piaget's investigation regarding the structure of thinking at each phase of its development is described. 3 criteria are considered as important in determining development: constant successive order, gradual integration, and structured ensembles. When examining the latter, Piaget finds 4 basic phases: the sensorimotoric, the preoperative, the operative, and the formal phase. Some of Piaget's experiments are described and their importance discussed. (Russian & English summaries)—E. Freidman.

2819. Vatsuro, E. G. (Inst. Evolutionary Physiology, AN SSSR, Leningrad) Orientirovochnyi i issledovatel'skii refleksy i razvitiie ikh v ontogeneze i filogeneze. [Orienting and investigatory reflexes and their development in ontogenesis and phylogenesis] *Vop. Psikh.*, 1962, No. 1, 113-120.—On the basis of his own and other investigators' data the author concludes that: (a) The orienting and investigatory reflexes are independent forms of reaction. (b) Genetically the orienting reflex is connected with the defense reflex, and the investigatory with the feeding reflex. (c) In ontogenesis and phylogenesis the investigatory reflex arises later than the orienting. (d) Distance receptors play a dominant role in the orienting reflex; contact receptors for the investiga-

tory. (e) The development of the investigatory reflex is characterized by a tendency towards prolongation and loss of direct utility. (f) The progressive development of the orienting reflex is characterized by increase of speed in its course and a shortening of its after effect. These conclusions are supported by a short history of the development of the concepts pointing out that Pavlov identified the 2 reflexes but later came to differentiate between them. In addition various experimental data are cited which, for example, show that the orienting reflex degenerates into a defuse reflex under the appropriate experimental conditions and in certain pathologies.—*H. Pick.*

INFANCY

2820. Caldwell, Bettye M. (State U. New York, Syracuse) **Assessment of infant personality.** *Merrill-Palmer. Quart.*, 1962, 8(2), 71-88.—With the current resurgence of research on infants, workers would do well to obtain representative samples, and to extend studies beyond the readily available neonate. Greater use of experimental, observational, and ecological methods should replace overdependence on interview data. Genuine adherence to a bio-social approach involves closer correspondence between theoretical positions and methodological choices. (45 ref.)—*E. L. Robinson.*

2821. Crowell, David H. (U. Hawaii, Honolulu) **Associations among anatomical and behavioral variables of full-term neonates.** *Child Developm.*, 1962, 33(2), 373-380.—A sample of 20 white females classified as clinically normal full-term births were measured, at birth, for body weight, body length, metacarpal length, and phalangeal stockiness. Behavioral measures included a sensorimotor scale, and a visual scale. Within the limitations of the sample it was concluded "that anatomical status of a full-term neonate has dubious value for selection or classificatory purposes relative to behavioral status at birth."—*W. J. Meyer.*

2822. Kiss, Tihamér. **Az örömrzés első megnyilvánulásai a gyermeknél.** [First manifestations of infant's pleasure.] *Pszichol. Tanulmányok*, 1958, 1, 85-93.—Direct observations and analysis of other investigators' data show that on the lowest level of biological development the infant's pleasure experiences are connected with food, homeostasis, and certain cutaneous stimuli. After this stage, conditioned reflexes develop. Movements and certain positions of the parents become conditioned stimuli. "Further development may be explained by the formation of 'dynamic stereotypes' (Pavlov) and other mental processes (e.g. apperception, memory, imagination) as well by the development of activity, and their organic connection with emotions." (Russian & English summaries)—*E. Friedman.*

2823. Kistyakovskaya, M. YU. (Inst. Pediatrics, A.M.N. S.S.S.R., Moscow) **Razvitie dvizhenii ruki u rebenka pervogo polugodiya zhizni.** [Development of hand and arm movements in children in the first six months of life.] *Vop. Psikh.*, 1962, No. 1, 89-100.—Observations of 8 children were systematically carried out twice a week from the 2nd week after birth to 6 months of age. All movements of each child and all stimuli impinging on him were recorded for the 1½ to 2½ hour observation periods. For more exact determination of the effect of visual reactions on movements of the hand the child was

placed in an isolated chamber which permitted presentation of visual stimuli, recording of (using motion pictures): general responses of the child, breathing rate, and specific hand movements. Several consecutive periods of development are noted in the general results presented. Up to 3-4 weeks isolated movements of the hands and arms almost never occur. From 3-4 weeks to 2½-3 months the development of hand movements occurs basically to visual and visual-auditory stimuli. From that time to 4½ months the regulating role of touch is increased and that of vision becomes more complex. From 4½ to 6 months vision acquires dominating significance in the development of hand and arm movements.—*H. Pick.*

2824. Richmond, J. B., Lipton, E. L., & Steinschneider, A. (State U. New York, Syracuse) **Autonomic function in the neonate: V. Individual homeostatic capacity in cardiac response.** *Psychosom. Med.*, 1962, 24(1), 66-74.—The capacity of infants to restore their cardiac rates to prestimulus levels was studied by means of a 5-sec. air stream to the abdominal wall of 16 female infants between 2 and 5 days of age. The infants differed in both extent and consistency of this capacity. These differences may be predictive of later physiological and psychological parameters of behavior.—*W. G. Shipman.*

2825. Schmitz, H. A. **Der Säugling: Ein soziales Wesen.** [The nursing: A social being.] *Acta paedopsychiat.*, Basel, 1962, 29(6), 172-178.—"Devoted turning-towards" is of vital importance and the consequences dire if not met. The conception "nest" as a symbol of security is based on false premises. The baby "signalizes" his needs. "Psychologizing fantasies" in infants is refuted.—*G. Rubin-Rabson.*

2826. Vassella, V., & Karlsson, B. (Stockholm, Sweden) **Asymmetric tonic neck reflex.** *Developm. Med. Child Neurol.*, 1962, 4(4), 363-369.—The relevant literature is reviewed. The question of the presence of tonic neck reflexes was studied under standardized conditions in a series of 108 healthy neonates. "Although asymmetric tonic neck reflex patterns were observed in 61 neonates, they could be regarded as true reflexes in only 9 neonates (8%)."—*T. E. Newland.*

2827. Walk, Richard D., & Dodge, Sue H. (George Washington U.) **Visual depth perception of a 10-month-old monocular human infant.** *Science*, 1962, 137(Whole No. 3529), 529-530.—A monocular infant tested on the "visual cliff" crawled over glass which had a patterned surface just beneath it and would not cross glass which had the same pattern 40 inches below its surface. Since this infant, using only monocular visual cues, was able to discriminate depth, the experiment disproves a general belief in the primacy of binocular cues in depth perception.—*Journal abstract.*

CHILDHOOD

2828. Binét, Agnes. (Hungarian Acad. Science) **Milyen tényezők torzítják el a társas kapcsolatokról való képzeteket és ítéleteket az ovodáskorban.** [Which factors distort ideas and judgments regarding social relations in nursery school children.] *Pszichol. Tanulmányok*, 1958, 1, 143-150.—In examining statements about social relations of nursery school children, 3 factors were found to be respon-

sible for distorting true judgments and ideas: (a) emotional loading, (b) conforming to opinions held or supposed to be held by adults, and (c) important events of the day. Emotional loading plays a more important role in statements about the children's own relations than in statements about other children. It was also concluded that "Children are usually more aware of the social relations of those who play an important part in class than of those considered not so important." (Russian & English summaries)—*E. Friedman.*

2829. Birch, H. G., Thomas, A., Chess, S., & Hertzog, M. E. (Albert Einstein Coll. Medicine) **Individuality in the development of children.** *Developm. Med. child Neurol.*, 1962, 4(4), 370-379.—"Stability" was found in the longitudinal study of 118 children (95 of whom have been studied during their 1st 2 years of life) in the "primary reaction characteristics" of (a) activity level, (b) rhythmicity, (c) approach or withdrawal, (d) adaptability, (e) intensity of reaction, (f) threshold of responsiveness, (g) quality of mood, (h) distractibility, and (i) attention span and persistence. Parents were found to be an "excellent source of information" under controlled interview.—*T. E. Newland.*

2830. Carney, R. E., & Trowbridge, N. (Drake U.) **Intelligence test performance of Indian children as a function of type of test and age.** *Percept. mot. Skills*, 1962, 14(3), 511-514.—The California Test of Mental Maturity (CMM) and the Goodenough Draw-a-man test (GDM) were administered to 36 Indian school children of 3 age ranges. No differences were found between the sexes. CMM language performance was low for the youngest children and approached the general norm with increasing age. CMM nonlanguage performance was high at the youngest age and also approached the norm at later ages. Initially, GDM scores were above the norm and then rose even higher in the older groups. This latter finding and the pattern of factor scores of the CMM indicated that the effect of acculturation in the school is not uniform, but depends on a narrowing of specific differences in experiences between the groups being compared.—*W. H. Guertin.*

2831. Denisova, Z. V. (Sechenov Inst. Evolutionary Physiology, USSR Acad. Sciences, Leningrad) **Deistvie ekstrazrazdrazhitel' na rechevye reaktsii rebenka.** [Effect of foreign stimuli on verbal reactions of children.] *Zh. vyssh. nervn. Deiatel.*, 1961, 11(6), 991-998.—Spontaneous and directed responses of a group of children (age 3 to 7) to drawing of geometrical figures were studied. Sound producing toys were introduced during the drawing as foreign stimuli and their effect on the children's reaction was investigated. It was established that these stimuli have both an inhibitory and disinhibitory effect on the verbal responses. The inhibition of verbal reactions in children of 3-4 years is often accompanied by disturbances of some other response. This does not occur with disinhibition. This is explained in terms of an extensive irradiation of the nervous processes as characteristic of preschool children.—*A. Cuk.*

2832. Fonzi, Ada. (U. Torino, Italy) **Problemi di psicologia infantile.** (2nd Ed.) [Problems of child psychology.] Torino, Italy: Paolo Boringhieri, 1960. viii, 247 p. L. 2500.—In discussing the current problems in child psychology the author presents

an analysis and evaluation of past studies adding a summary of her own research findings and conclusions over the following major problems: (a) influence of learning on the social behavior of the preschool age child; (b) the problem of imitation, development and prospects; (c) social relations of the 4 to 8 year olds; (d) concerning a stereotype of infancy; (e) the concept of beauty in infancy and childhood; (f) inquiry into factors influencing the psychical development in early infancy; (g) an experimental study of the reaction to frustration in culturally diverse groups; and (h) an experience in readjustment by a group of adolescents. (34-p. ref.)—*H. Angelino.*

2833. Fuller, J. B., & Chagnon, G. (U. Ottawa) **Factors influencing rotation in the Bender-Gestalt performance of children.** *J. proj. Tech.*, 1962, 26(1), 36-46.—The influence of stimulus variation and/or cue utilization on design rotation is studied. Vertical and horizontal placement of figures and alteration in shape of ground were variables introduced to groups of normal, neurotic, and schizophrenic children. "It was found that a vertically oriented figure produced more rotation than a horizontal one and the diamond shape produced more rotation than the rectangular shape." Configuration 3 produced the most rotation.—*A. F. Greenwald.*

2834. Galluser, U. M. **Leik-teoriar.** [Theories of play.] *Norsk pedagog. Tidsskr.*, 1961, 45(9-10), 349-358.—A brief review of some of the theoretical writings concerning the role and function of play in the child's development.—*L. Goldberger.*

2835. Gellert, Elizabeth. (Albert Einstein Coll. Medicine) **Children's conceptions of the content and functions of the human body.** *Genet. psychol. Monogr.*, 1962, 65, 293-405.—Methods for gathering and analyzing data concerning children's conceptions of the human body were devised. The material was used, primarily, to present a model for charting developmental trends in children's ideas about the content and functioning of their interior. 96 boys and girls, most of them pediatric patients, ranging in age from 4 to 16 years participated in the study. A large proportion of the ideas voiced appeared to be culturally derived. However, only selected information seemed to be assimilated by the Ss. Inferences derived from personal sensations, observations, and manipulations of the body were often referred to in explaining physiological functions. At all ages, magical, mystical, and animistic conceptions were reported very rarely. A marked improvement in the quantity and quality of statements made concerning bodily content and functioning occurred at about age 9 years.—*Author abstract.*

2836. Hawkes, Glenn R., & Pease, Damaris. **Behavior and development from 5 to 12.** New York: Harper, 1962. xiv, 375 p. \$5.75.—A textbook about growth, development, and guidance of the school-age child, containing "the pertinent research from many fields which contribute to the science of child development—anthropology, biology, home economics, medicine, physiology, psychology, and sociology." One chapter deals with "Observing and Recording Children's Behavior." Age profiles, anecdotes, case histories, and illustrations supplement the text. References after all chapters and study problems after most. Appendixes include a selected film list and a list of selected pamphlets.—*B. Lowenfeld.*

2837. Institute of Child Study, Parent Education Division. (U. Toronto, Canada) **Selected reading in child study for parents and leaders.** *Bull. Inst. Child Stud., Toronto*, 1962, 24(1, Whole No. 92), 24 p.—An extensive briefly annotated bibliography for parents, with additional references for leaders and educators. Included are textbooks and general reference books, as well as references on discipline; infant and preschool years; school age; adolescence; sex education; play and recreation; morality, religion and philosophy; and exceptional children. (200 ref.)—D. G. Appleby.

2838. Kántás, László. (Hungarian Acad. Science) **Egy ovodai csoport társas szerkezete.** [Social structure of a kindergarten children's group.] *Psichol. Tanulmányok*, 1958, 1, 140-142.—Through the method of nonparticipant observation of the social structure of a kindergarten group it was found that "though the social structure has the character of an aggregate, still groups may be distinguished on the basis of stable connections. The factors contributing toward the formation of groups are: sex, activity, age and extra-school connections." (Russian & English summaries.)—E. Friedman.

2839. Kowalski, Stanisław. **Rozwój mowy i myślenia dziecka.** [The development of speech and thinking in socio-educational situations in the kindergarten.] Warsaw, Poland: Państwowe Wydawnictwo Naukowe, 1962. 311 p.—The book analyzes a series of investigations and experiments concerning the speech development of preschool children. The speech pattern at this age is basically concrete-imaginings in nature and is affected by the school, family, and the child's emotional tone and degree of self-reliance. The ability to tell stories is a function of the attractiveness of the situation and the stimulating influence of the social situation. The child's ease of speaking in didactic situations is a variable quality. The ability to solve pictorial problems depends on the child's age and subject matter. Competency in the use of complete sentences is developed by child's ability to ask questions. The last chapter outlines procedures for assisting preschool children in their speech development.—H. Kaczkowski.

2840. Laurendeau, Monique, & Pinard, Adrien. (U. Montreal) **La pensée causale.** [Causal thought.] Paris, France: Presses Universitaires France, 1962. xi, 225 p. NF 15.—An experimental genetic approach to the development of causal thought in children is described in detail. From tests administered to 500 French-speaking Canadian children between 4 and 12 years old, it is concluded that Piaget's 5 stages in the evolution of infantile thought patterns are in general confirmed, although evidence for the initial, most primitive stage is lacking. A critical review of previous research is included. (52-item bibliogr.)—G. H. Mowbray.

Goldberger.

2847. Strickland, Ruth G. (Indiana U.) **The language of elementary school children: Its relationship to the language of reading textbooks and the quality of reading of selected children.** *Bull. Sch. Educ. Ind. U.*, 1962, 38(4), 1-131.—"A loosely structured descriptive study of children's language. Its major purpose was to discover, isolate, and describe the patterns of syntax found in the oral language of elementary school children and to ascertain whether they appeared in certain representative reading textbooks . . ." in grades 1-6. Findings indicate that "the oral language children use is far more advanced than the language of the books in which they are taught to read."—R. E. Schutz.

2848. Umanskii, L. I. (Pedagogical Inst., Kursk) **O "sshibke" kak prieme izucheniya nervnoi sistemy detei.** [On "conflict" as a method of studying the nervous system of children.] *Vop. Psikhol.*, 1962, No. 1, 134-142.—The history of the experimental study of conflict is traced from Pavlov's original investigations to modern times. The relations suggested to subsume between type of nervous system and behavior in a conflict situation are pointed out. An experiment is described in which 50 kindergarten children are conditioned to make a motor response to a light signal and a tone. Differentiation is established by extinguishing the response to a light signal of a different color and a tone of a different timbre. After this discrimination reached a criterion of latency and reliability, a positive and negative stimu-

lus were presented simultaneously. The responses of the children varied in amount and latency of reaction occurring at the time of the conflict and on subsequent trials. The reactions of the children were related to the classification of type of nervous system which was presumably determined independently. Thus 6 out of 7 children displaying a positive reaction during conflict had a nervous system characterized as being strong-excitabile. 5 out of 7 children who displayed an inhibitory reaction during the conflict had a strong-inhibitory type of nervous system, etc.—H. Pick.

2849. Wallon, Henri, & Lurçat, Liliane. Espace postural et espace environnant (le schéma corporel). [Postural space and environmental space (the body schema.) *Enfance*, 1962, No. 1, 1-33.—In order to discover the factors defining the body schema, 356 children ages 2-11 to 13 were given several tasks requiring subjective positioning of arms and legs, i.e. holding these members in prescribed positions; objective movements in which the child put his body members in positions required for prescribed acts, such as holding an umbrella. The children were also asked to adjust the members of an articulated mannikin, to imitate the result, and to follow verbal instructions about position. There is an extensive analysis of the results with respect to laterality, "mirroring," the role of manipulation, and other factors. It is concluded that postural and environmental space are closely related. Different aspects of space, an external reality, are recognized as a function of the developing diversity of activities. Different levels of development may be discerned. Language development becomes importantly involved in later stages.—S. S. Marzolf.

2850. Wenar, Charles, & Coulter, Jane B. (U. Pennsylvania School Medicine) A reliability study of developmental histories. *Child Developm.*, 1962, 33(2), 453-462.—"Twenty-five mothers were re-interviewed three to six years later in order to determine whether they would give the same (S) or different (D) developmental information. The results were as follows: (a) 43 per cent of the statements were judged as D, and 40 per cent of these represented extreme changes. (b) There was no tendency to give more positive and pleasant information in the second interview. (c) The most reliable items were: child wanted or not, sex preference, breast or bottle fed, motor development, regression in toilet training, illness, sleep in infancy. The least reliable items were: health in pregnancy, discipline, relation to mother, relation to father, attitude toward problem, and comments."—W. J. Meyer.

Learning

2851. Brackbill, Yvonne, & Kappy, Michael S. (U. Colorado Medical School) Delay of reinforcement and retention. *J. comp. physiol. Psychol.*, 1962, 55(1), 14-18.—"Third-grade boys learned a series of discriminations under reinforcement delay intervals of 0, 5, or 10 sec. Recognition and relearning were tested one day or eight days after learning. Retention was facilitated by delay during acquisition for the short retention interval; the facilitative effect faded when retention was tested after the longer interval."—W. A. Wilson, Jr.

2852. Dmitriev, A. S. (Chair of Human and Animal Physiology, Bashkir U., Ufa, USSR) Okha-

ractere vzimodeistviia signal'nykh sistem u detei shkol'nogo vozrasta. [Nature of the interaction of the signaling systems in school children.] *Zh. vyssh. nervn. Deiatel.*, 1961, 11(6), 969-978.—25 children (age 8-16) were taught to cover up pictures of objects at the presentation of the picture and of the name of the object. Concrete and general names were used (oak-tree-plant). The RT of motor reactions was measured. After the formation of conditioned reflexes, Ss were tested for elective irradiation (reaction to any object) and for differential response. It was shown that when the pictorial stimulus was replaced by a verbal one, or vice versa, there emerged a conditioned reaction through the mechanisms of elective irradiation, difficult and slow at first, smooth and rapid after a few repetitions. The increase in age also made for a greater smoothness and constancy of the elective irradiation.—A. Cuk.

2853. Elkind, David; Koegler, Ronald R., & Go, Elsie. (U. California, Los Angeles) Effects of perceptual training at three age levels. *Science*, 1962, 137(Whole No. 3533), 755-756.—Children 6, 7, and 8 years old were first tested for their ability to reverse figure and ground and then given special training in this skill. Although all the children's ability improved greatly with practice, the initial differences between the age groups were still apparent both immediately and 1 month after training.—*Journal Abstract.*

2854. Erickson, Marilyn Ann. (U. Washington) Effects of social deprivation and satiation on verbal conditioning in children. *Dissert. Abstr.*, 1961, 22(5), 1722.—Abstract.

2855. Fowler, William. (Yale U.) Cognitive learning in infancy and early childhood. *Psychol. Bull.*, 1962, 59(2), 116-152.—The stress on genetic factors in early cognitive development has led to the amassing of a considerable body of normative data. However, there has been little interest in determining the scope and complexity of learning possible during the initial phases of development. Research literature and theoretical orientations are presented to show the potential importance of studying early cognitive learning. (201 ref.)—W. J. Meyer.

2856. Gelfand, Donna Mae Larsen. (Stanford U.) The influence of self-esteem on rate of conditioning and social matching behavior. *Dissert. Abstr.*, 1961, 22(5), 1732-1733.—Abstract.

2857. Hively, Wells. (Harvard U.) Programming stimuli in matching to sample. *J. exp. Anal. Behav.*, 1962, 5(3), 279-298.—"In these investigations, a 'teaching machine' was used to train pre-school and first-grade children in a series of progressively difficult discrimination tasks, leading up to matching to sample. Such training was much more efficient than training in the final discrimination alone. The errors the subjects made were found to be a function both of the differences between consecutive discriminations (the 'size of the steps' in the program) and the length of training on each discrimination. Theoretical and practical implications of these findings are discussed." (27 ref.)—J. Arbit.

2858. Lipsitt, L. P. (Brown U.) Stimulus generalization and discrimination learning by children. *Percept. mot. Skills*, 1962, 14(1), 11-17.—4 groups each of 20 1st graders received different pretraining prior to testing on a 2-stimulus discrimi-

nation task involving colored lights. Best discrimination learning was found for the group having unreinforced pretraining experience with the positive stimulus. Next, came those with unreinforced experience with the negative stimulus. Next, were those with unreinforced experience with both positive and negative stimuli. Discrimination learning was poorest for the group that had prior reinforced experience with both stimuli. Performances were significantly different from comparisons of the highest performing group and the 2 lowest as well as between the 2nd highest and the lowest.—*W. H. Guertin.*

2859. McKee, John P., & Riley, Donald A. (U. California, Berkeley) Auditory transposition in six-year-old children. *Child Develpm.*, 1962, 33 (2), 469-476.—“First grade children were trained to discriminate between two successive auditory stimuli which differed either in amplitude or frequency. Subjects who learned were then tested for transposition. Though the frequency stimuli were demonstrated to be initially more discriminable than the amplitude stimuli, a significantly larger proportion of amplitude subjects was able to learn the discrimination to criterion. Further, for those subjects who reached the criterion, transposition was significantly greater for amplitude than for frequency.”—*W. J. Meyer.*

2860. McCray, Curtis L., & Harper, Robert S. (U. Nebraska) Some relationships of schedules of reinforcement to variability of response. *J. comp. physiol. Psychol.*, 1962, 55(1), 19-21.—Kindergarten children learned to press a bar for a visual incentive. Subsequently they were tested in a new situation in which any of 4 responses would produce the reinforcement. Greater response variability was seen in this test situation when the original learning had been with a variable ratio schedule than when a fixed-ratio or regular schedule of reinforcement had been used.—*W. A. Wilson, Jr.*

2861. Nishimura, Ruth. (Rutgers U.) Reinforcement as a function of interpersonal and situational variables. *Dissert. Abstr.*, 1961, 22(5), 1725.—*Abstract.*

2862. Siegel, Sidney, & Andrews, Julia McMichael. (Pennsylvania State U.) Magnitude of reinforcement and choice behavior in children. *J. exp. Psychol.*, 1962, 63(4), 337-341.—“The classical two-choice uncertain outcome experimental paradigm has been adapted for use with preschool children in a test of the predictions of two models for choice behavior in the situation. Children exhibited a greater tendency to maximize the probability of a correct response as the amount of reinforcement for such a response was increased. . . . In addition, it is suggested that the maximizing tendency observed among very young children may be indicative of a more advanced stage in the development of a ‘concept of probability’ in children of this age than that which may be inferred from Piaget’s results.”—*J. Arbit.*

2863. Sokhina, V. P. (Moscow State U., USSR) Vydelenie figury iz fona det'mi-doshkol'nikami: Soobshchenie I. Vydelenie prostykh form na chertezhe. [Isolation of figures from their ground by preschool children: Communication I. Isolation of simple forms by means of drawings.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1962, No. 1, 85-88.—40 children (age 3-6) were trained to reconstruct different figures (a house, geometrical designs) out of their

elements. In spite of strong age differences, the general conclusion was drawn that “the isolation of geometrical figures out of a complex background is possible, in a general way, at all stages of pre-school age.”—*A. Cuk.*

2864. Start, K. B. (U. Western Australia, Netherlands, W. Australia) The influence of subjectively assessed “games ability” on gain in motor performance after mental practice. *J. genet. Psychol.*, 1962, 67, 169-173.—38 11-year-old boys were tested in throwing. They were naive to a 2nd throwing skill in which they were subsequently given instruction, and mentally, but not physically, practiced this skill during 9 daily practice periods, each of 5 minutes duration. They were subsequently tested in their performance of the skills they had been mentally practicing. The “games ability” of each member of the group was calculated from subjective assessments of his performances at 4 games. The boys were then placed in rank order and the ranking subdivided into high, average, and low “games ability” groups. It was found that only the high “games ability” group made statistically significant improvement over the period of the practice and that the greatest gain occurred within this group with the boys who scored least in the original throwing test. Thus it appeared that 2 factors could have contributed to the results, “games ability” or motivation caused by a necessity to maintain a games reputation.—*Author abstract.*

2865. Suppes, Patrick, & Ginsberg, Rose. (Stanford U., Palo Alto, Calif.) Application of a stimulus sampling model to children’s concept formation with and without overt correction responses. *J. exp. Psychol.*, 1962, 63(4), 330-336.—5- and 6-year-old Ss learned 2 concepts in the binary number system, each concept represented by 3 different stimuli, using either a correction (C) or noncorrection (NC) procedure. Group C was better than Group NC. Both a paired associate analysis and a pure property analysis, in which all stimuli describing a single concept were treated as identical items, were employed.—*J. Arbit.*

2866. Walters, Richard H., & Foote, Ann. (U. Toronto) A study of reinforcer effectiveness with children. *Merrill-Palmer Quart.*, 1962, 8(3), 149-157.—Using the marble box employed by Gewirtz and Baer, 1st- and 2nd-grade girls rated high or low on dependency (Beller scale) were conditioned (half of them in a potentially anxiety-arousing situation and half of them in friendlier circumstances) with the use of 3 types of reward. Significant differences were attributable to types of reward; the incentive value of verbal reinforcers was low for this task.—*E. L. Robinson.*

2867. Zinchenko, V. P., Lavrent'eva, T. V., & Ruzskaia, A. G. Sravnitel'nyi analiz osiazaniia o zreniia: Soobshchenie X. Osobennosti dvizheniia ruki pri vypolnenii pertseptivnogo i opoznavatel'nogo deistviia. [Comparative analysis of touch and vision: Communication X. Features of hand movements in carrying out perceptual and recognition tasks.] *Dokl. Akad. Pedag. Nauk RSFSR*, 1962, No. 1, 81-84.—24 children (age 3-7) were instructed to handle 2 flat figures under 2 conditions: (a) learning to know the figure by touch only, and (b) recognizing by touch a figure seen before. The hand movements were photographed. The analysis shows significant differences between age groups and

between the learning and the recognition of figures.
—A. Cuk.

Abilities

2868. Case, D., & Collinson, J. M. (U. Birmingham) The development of formal thinking in verbal comprehension. *Brit. J. educ. Psychol.*, 1962, 32(2), 103-111.—Children of both sexes, age 14-18, were studied to see if inferences drawn in history, etc., correspond to Piaget's description of the formal operational stage of reasoning. "Formal thought in language subjects appears to need more than the attainment of a certain Chronological and/or Mental Age." More important is the sequence of stages. Appendix presents one text and questions and specimen answers—B. T. Jensen.

2869. Fisher, Seymour. (State U. New York Medical School, Syracuse) Developmental sex differences in right-left perceptual directionality. *Child Developm.*, 1962, 33(2), 463-468.—"A group of 189 children were studied to determine if they would manifest right-left consistencies in their autokinetic perceptions. It was found that beginning with age 11 male Ss were significantly more often right-directional than female Ss, but there were no significant differences before this age. The question was raised whether a special psychological reorganization in the right-left dimension does not occur in the adolescent period. It was also suggested that the differences in autokinetic directionality between the two sex groups might represent differences in distribution of right vs. left muscle tonus levels."—W. J. Meyer.

2870. Hood, H. Blair. (Cumberland, England) An experimental study of Piaget's theory of the development of number in children. *Brit. J. Psychol.*, 1962, 53(3), 273-286.—In spite of the great weight of theory and speculation they contain, Piaget's books are all founded essentially on experimental work with children, and the purpose of this study was to repeat some of the experiments which Piaget has outlined in the book on number. Piaget has been criticized for not stating the number of Ss who took part in a given experiment from which he has drawn a specific conclusion: for not giving precisely the age range of the Ss, and for not relating their performance to mental age as well as to the chronological age. The aim of this study therefore was to determine whether (a) a group of normal English speaking children, and (b) a sample of mentally retarded children and adults, would show the same general trends in development of pre-number concepts as Piaget's Ss. The factors of mental and chronological age were also considered, as well as the relation of stage of development to ability in arithmetic.—*Journal abstract*.

2871. Horton, Carrell P., & Crump, E. Perry. (Meharry Medical Coll.) Growth and development: XI. Descriptive analysis of the backgrounds of 76 Negro children whose scores are above or below average on the Merrill-Palmer scale of mental tests at three years of age. *J. genet. Psychol.*, 1962, 100(2), 255-265.—Ss consisted of 76 Negro children whose percentile scores on the Merrill-Palmer Scale of Mental Tests fell within 1-19 and 80-99 at 36 months of age. Characteristics of both the child and his family were analyzed descriptively in relation to test performance, and included: sex, birth weight, height and weight at 36 months,

socio-economic status, education of parents, employment of mother, number of siblings, parents' marital status, and occupation of father.—*Author abstract*.

2872. Jones, S. (University Coll.) The Wechsler Intelligence Scale for Children applied to a sample of London primary school children. *Brit. J. educ. Psychol.*, 1962, 32(2), 119-133.—A stratified sample of 240 children, aged 7½-10½, received both the WISC and the Stanford-Binet. For average and above children a higher IQ is found on Binet than on WISC and "... the size of the discrepancy ... is too large to permit the use of the WISC as a substitute ..." Reliability of the WISC is reasonable in this sample and the WISC is "... more valid and reliable at year 10 than at year 8 or 9, for this sample" 8 tables present data on factor loadings and other matters. (18 ref.)—B. T. Jensen.

2873. Landmark, Margrete, & Grinde, Turid. (Sentralinst. Cerebral Parese, Oslo, Norway) Undersøkelse av en gruppe normale barn med forskjellige intelligensprøver. [A group of normal children tested with five intelligence tests.] *Nord. Psykol.*, 1962, 14(4), 171-185.—44 Norwegian children, age 8-9, were each given 5 different intelligence tests: Norwegian Binet; Revised Edition of Columbia Mental Maturity Scale; author adaptation of Leiter International Performance Scale; Raven Progressive Matrices, Sets A, AB, B, revised order; and Goodenough Draw-a-man. The results showed considerable variation from test to test for a given child, indicating the necessity for a combined battery to obtain a comprehensive view of the child's resources. The author suggests adding up the standard scores from all the tests, excluding the Goodenough, and taking the sum as the index of intelligence. A statistical analysis revealed the Binet and the Raven tests as giving the best single measure of IQ for this group of children. The absurdity of comparing IQ's from tests with different means and standard deviations is discussed, and the necessity for establishing adequate age norms in Norway is pointed out.—L. Goldberger.

2874. Nelson, Thomas M., & Bartley, S. Howard. (Michigan State U.) Various factors playing a role in children's responses to flat copy. *J. genet. Psychol.*, 1962, 100(2), 289-308.—The conventional assumption made by those involved in research and testing is that flat copy materials (forms on a 2-dimensional surface), offer unequivocal stimulus materials. The authors assume that flat copy can be reacted to in a number of ways. To test the hypothesis, an outline drawing of a diamond (flat copy) was presented to children from ages 3 to 11, and to 20 female college students. With this flat copy was presented a group of other items ("diamonds") out of which the S was to choose the one perceived to be most like the flat copy sample, next most like, etc. The results showed that areal features are primarily oriented at earlier ages, that perception of edges occurs later, and that formal training influences the visual appreciation. The findings are related to Stanford-Binet Test norm for reproduction of flat copy materials at various age levels.—*Author abstract*.

2875. Russell, David H., Saadeh, Ibrahim Q. (U. California, Berkeley) Qualitative levels in children's vocabularies. *J. educ. Psychol.*, 1962, 53(4), 170-174.—An experimental test of 40 items

given to 257 3rd-, 6th-, and 9th-grade pupils revealed a definite decrease in choice of concrete definitions and increase in functional and abstract choices at each higher level, and especially between the 3rd and 6th grades. Significant differences were obtained between all categories except functional choices in the 6th and 9th grades. When children were classified according to their dominant response on the vocabulary test (at least 40% of the choices in that area) it was found that there was a significant difference between the mixed and both the functional and abstract groups at the 1% level of confidence.—*Journal abstract.*

2876. Shapiro, Herbert. (Albert Einstein Medical Cent., N. Division, Philadelphia) **The development of walking in a child.** *J. genet. Psychol.*, 1962, 100 (2), 221-226.—In a normal child, a latent period of 25 days was observed between independent standing and independent walking. Development proceeded from initial steps to continuous, essentially unaided walking, over a period of 34 days. Once initiated, facility in walking developed at an exponential, not a linear rate.—*Author abstract.*

2877. Shechtman, Audrey M. (U. Minnesota) **The relationship of variability in children's verbal and non-language test performance to current and later behavioral functions.** *Dissert. Abstr.*, 1961, 22(6), 2065-2066.—*Abstract.*

2878. Smedslund, Jan. (U. Oslo, Norway) **The acquisition of conservation of substance and weight in children: VII. Conservation of discontinuous quantity and the operations of adding and taking away.** *Scand. J. Psychol.*, 1962, 3(2), 69-77.—In Experiment I a test of conservation and highly different items of addition and subtraction were given. Conservation was closely related only to an item involving a subtraction of a piece and a subsequent addition of the same piece ($- +$ sequence), followed by an addition of a piece and the subsequent subtraction of the same piece ($+ -$ sequence). In Experiment II a test of conservation was given together with items involving various combinations of simple $- +$ and $+ -$ sequences. It is concluded that $- +$, $+ -$, and conservation seem to form a genetic sequence in this order, thus strengthening the hypothesis that a concept of conservation reflects a complete reversibility of the operation of $+$ and $-$.—*Journal abstract.*

2879. Sokhina, V. P. (Moscow State U., USSR) **O vydelenii figury iz fona doskol'nikami. Soobshchenie II. Chlenenie figury i vydelenie zadannykh chastei.** [Figure-ground discrimination in preschool children. Communication II. Analysis of figures and isolation of given parts.] *Dokl. Akad. Pedagog. Nauk RSFSR*, 1962 No. 2, 71-74.—Ss (age 3-6) were given 3 tasks: (a) to isolate squares and triangles from complex figures, (b) to analyze complex figures into squares and triangles following a drawing, and (c) same as in (b) but without a drawing. The 1st task was solved almost by all Ss. The 2nd was difficult even for the 6 year olds. Task 3 was carried out almost by all Ss in the sense that they were able to identify smaller units in very complex figures.—*A. Cuk.*

2880. Suchman, J. Richard, & Aschner, Mary Jane McCue. (U. Illinois) **Perceptual and cognitive development.** *Rev. educ. Res.*, 1961, 31(5), 451-462.—During the past decade there has been increasing

interest in the effects of central and intervening processes on the act of perceiving. The construction of theories and models of perceptual mediation has not been matched by empirical research, however, and a number of hypotheses have been put forward that are still in need of adequate testing. Developmental studies of form perception have persistently produced the finding that common objects are invariably perceived and discriminated more readily by young children than are Euclidian shapes. The act of making social judgments involves more than simple perceptual discriminations. J. P. Guilford and his associates' tests tap such factors in creativity as ideational fluency, spontaneous flexibility, and originality. The most recent studies on the growth of particular concepts reflect Piaget's influence. (39 ref.)—*F. Goldsmith.*

2881. Varma, P. R. **Ethical discrimination as related to intelligence, age and sex: A study of moral development in children.** *J. psychol. Res., Madras*, 1962, 6(1), 44-51.—The investigation was conducted on 151 children, 92 boys and 66 girls, in the age range of 3+ to 8+. Results show that: no significant relationship exists between intelligence and ethical discrimination, capacity for ethical discrimination improves with age, and there are no significant sex differences in the capacity for ethical discrimination.—*U. Pareek.*

2882. Venger, L. A. (Inst. Preschool Education, RSFS Acad. Pedagogicheskikh Sciences) **Razliche-nie formy predmetov det'mi rannego vozrasta.** [Discrimination of form of objects by children of early age.] *Dokl. Akad. Pedagog. Nauk RSFSR*, 1962, No. 2, 75-80.—4 Ss (age from 2 months and 1 day to 3 months and 10 days) were presented with wooden, solid, and flat objects of different geometrical form. Some were "old" (Ss had previously played with them) and some were new. Discrimination was measured by the duration of visual fixation on the objects. The following conclusions were drawn: (a) Discrimination is possible at this early age. (b) In some cases, even degrees of discrimination between figures can be established. (c) When the old figure is presented in a different spatial arrangement, it is not recognized by Ss.—*A. Cuk.*

2883. Young, H. B., Tagiuri, R., Tesi, G., & Montemagmi, G. (Harvard) **Influence of town and country upon children's intelligence.** *Brit. J. educ. Psychol.*, 1962, 32(2), 151-158.—793 town children and 373 country children in the Florence, Italy, area were given a relatively culture-free intelligence test. Ages ranged from 9 yr. 6 mo., to 14 yr. 6 mo. Town boys scored higher than town girls, but the reverse was true of the country children. No differences were noted between urban and rural girls. Data were also analyzed by social class.—*B. T. Jensen.*

Personality

2884. Alby, J. M. **Identité et rôle sexuels.** [Identity and sexual roles.] *Evolut. psychiat.*, 1962, 27(2), 189-223.—The child adopts a sexual role before being conscious of his sexual identity and without knowledge of anatomical sexual differentiation. The author hypothesizes a preform, engraved in the experienced image of the body, different for boys and girls, which develops this identity through identifications. For examples, distortions in identity and sexual role, such as twins, fetishes, and obesity are

cited, as well as the influence of cultural factors. (45 ref.)—*L. A. Ostlund.*

2885. Argyle, Michael, & Robinson, Peter. (Inst. Experimental Psychology, Oxford) **Two origins of achievement motivation.** *Brit. J. soc. clin. Psychol.*, 1962, 1(2), 107-120.—Previous investigations show that achievement motivation in childhood can be produced by rewards and punishments only under unusual circumstances. The hypotheses that 2 other types of learning may also occur were tested in a correlational study of 500 children. Measuring achievement motivation by means of imaginative stories, questionnaires, and relations with parents by a modified version of the semantic differential, it was confirmed that learning can occur by the introjection of parental exhortation and standards and by identification with achievement-oriented parents and others provided, in both processes, that the parental identification is sufficient. Achievement motivation was also found to be correlated with various measures of self-aggression and guilt.—*C. M. Franks.*

2886. Arkos-Udvardi, Charlotte. (Hungarian Acad. Science) **A barát-választás indokolása ovodáskorban.** [Motives of kindergarten children in their choice of friends.] *Pszicholo. Tanulmányok*, 1958, 1, 161-164.—Motives given by kindergarten children for their choice of friends were compared to answers on a similar topic given by school children. It was found that motives do not change with age, but show differences according to sex and play-communities. The majority of the professed motives come under the heading of (a) conformity (to the motives of adults), (b) solidarity, (c) character. (Russian & English summaries)—*E. Friedman.*

2887. Bronson, G. **Critical periods in human development.** *Brit. J. med. Psychol.*, 1962, 35(2), 127-133.—"Assuming that critical periods represent development stages during which the organism is maximally involved in the initial channelling of a new motivational system, it was predicted that the enduring motivational orientations of an individual could be most sensitively appraised by observations during the appropriate critical periods." Selective predictive efficiency was found for males but not for females. Involvement with people and orientation toward competence at age 9-10½ were predicted, respectively, from observations made during the 1st year of life and the 3rd year.—*C. L. Winder.*

2888. Collins, L. F., Maxwell, A. E., & Cameron, Kenneth. (Maudsley Hosp., London, England) **A factor analysis of some child psychiatric clinic data.** *J. ment. Sci.*, 1962, 108 (Whole No. 454) 274-285.—2 samples, of 268 boys and 98 girls, after elimination of cases of mental retardation, epilepsy, and psychosis, studied on 60 items of clinic information used in assessment of children's problems, revealed little common variance. However, factors identified as rebelliousness and rootlessness typified the boys and also showed up for the girls. A factor of anxiety also characterized the boys, and a factor of "timid school failure" the girls.—*W. L. Wilkins.*

2889. Farnham, Sylvia. (U. Pennsylvania) **Effects of task similarity, preference, difficulty, outcome and goal value on expectancy-generalization.** *Dissert. Abstr.*, 1961, 22(5), 1732.—*Abstract.*

2890. Gasser, Edith Strieter. (New York U.) **An investigation of the body image of boys as**

expressed in self drawings: An intercultural study. *Dissert. Abstr.*, 1962, 22(12), 4425-4426.—*Abstract.*

2891. Gourevitch, Vivian, & Feffer, Melvin H. (City Coll., N. Y.) **A study of motivational development.** *J. genet. Psychol.*, 1962, 100(2), 361-375.—A hierarchy of motivation, following Maslow's general scheme, was formulated in terms of 4 successive levels of development. A total of 104 male Ss, ranging in age from 6 years to adulthood, were given the Role-Taking Task, a projective test based on the MAPS in which the S takes the roles of the actors in his stories. Motivation scores were obtained from a content analysis of the Role-Taking protocols, and were controlled for the Ss' verbal productivity. Ss were also given the WISC or WAIS Vocabulary Test. Comparisons were made between 3 age groups: Adults (mean age 36.0 yr.), older children (10-13), and younger children (6-9 yr.). The results confirmed the motivational hierarchy. Older children differed significantly from younger children at the 2nd level of the hierarchy, and adults differed significantly from older children at the 3rd and 4th levels of the hierarchy. Adults differed increasingly from children at successively higher levels of the hierarchy. The symbolic reinforcement represented by the 3rd and 4th levels of the hierarchy was rarely mentioned by the children, and there were no significant differences between older and younger children at these levels.—*Author abstract.*

2892. Grattarola, F. R., & Rovera, G. G. **Problemi psicopatologico clinici in tema di melancolie dell'età evolutiva.** [Psychopathological and clinical problems in the theme of depressions in the developmental age.] *Arch. Psicol. Neurol. Psichiat.*, 1962, 23(3), 223-248.—Depressions in the developmental age cannot happen prior to 3 or 4 years of age, because a psychological basis for the development of the ethical level of conscience does not exist.—*L. L'Abate.*

2893. Haworth, Mary R. (Nebraska Psychiatric Inst.) **Responses of children to a group projective film and to the Rorschach, CAT, Despert Fables and DAP.** *J. proj. Tech.*, 1962, 26(1), 47-60.—Some consistency was demonstrated in children's responses to individual and group projective techniques. Obsessives' responses corresponded to expectation on Rorschach, CAT, and in recall of punitive film scenes. The group film test may serve as a quick screening device in a school situation.—*A. F. Greenwald.*

2894. Hulek, Jane Elizabeth. (Boston U.) **Peer relations and body-image maturity in children.** *Dissert. Abstr.*, 1961, 22(4), 1252.—*Abstract.*

2895. Johnson, Ronald C. (U. Hawaii, Honolulu) **A study of children's moral judgments.** *Child Developm.*, 1962, 33(2), 327-354.—All of the children in grades 5, 7, 9, and 11 (N = 807) were administered a moral judgment test, and subsamples in grades 7, 9, and 11 were administered a test of abstractness-concreteness. Parents of Ss in the subsamples responded to a parent attitude test. Correlations between moral judgment responses revealed more positive and significant correlations than would be expected by chance. Abstractness-concreteness was slightly related to moral judgment but parental attitudes were significantly related.—*W. J. Meyer.*

2896. Jones, Austin. (U. Pittsburgh) **Sexual symbolic response in prepubescent and pubescent children.** *J. consult. Psychol.*, 1961, 25(5), 383-387.—Prepubescent children designate elongated geomet-

ric figures as male and rounded figures as female. Near puberty the response drops to chance level.—*E. R. Oetting.*

2897. Kagan, Jerome, & Moss, Howard A. (Fels Research Inst., Yellow Springs, O.) **Personality and social development: Family and peer influences.** *Rev. educ. Res.*, 1961, 31(5), 463-474.—Research in personality development has concentrated on 2 particular areas: (a) the motive-related responses of aggression, dependence, achievement, and sex-role identification and (b) the effects of parental control, affection, and personality on the development of the child's needs and patterns of social interaction. The last 3 years have witnessed a dramatic increase in studies on the long-term stability of behavior. The data suggested that measures of selected behaviors of school-age and adolescent children often were predictive of adult functioning, especially when the behavior in question was congruent with traditional sex roles. The delineation of 2 primary dimensions of maternal behavior—love versus hostility and autonomy versus control—was one of the important advances in research in parent-child relations. The effects of separation from the family and the peer-group influence came under closer scrutiny. (75 ref.)—*F. Goldsmith.*

2898. Lebo, Dell. (Child Guidance & Speech Correction Clinic, Jacksonville, Fla.) **Aggressiveness and expansiveness in children.** *J. genet. Psychol.*, 1962, 100(2), 227-240.—It is generally agreed that aggressive children are more expansive, in that they require a greater amount of space, than nonaggressive children. Hypotheses were constructed with regard to room space, number of words used, and drawing size. 80 children, divided chronologically into groups aged 4, 6, 9, and 12 years and categorized according to scores indicating aggressive intermediate, and non-aggressive tendencies on a scale of aggression were used as Ss. As hypothesized, it was found that there was relationship between use of space and words and aggression and age. However, drawing size was not found to be related.—*Author abstract.*

2899. Maskit, Mae Lee. (U. Michigan) **Management of aggression in preadolescent girls: Its effect on certain aspects of ego functioning.** *Disser. Abstr.*, 1961, 22(3), 917.—*Abstract.*

2900. Reese, Hayne W. (U. Buffalo) **Sociometric choices of the same and opposite sex in late childhood.** *Merrill-Palmer Quart.*, 1962, 8(3), 173-174.—5th-grade Ss using a rate sociometric scale (from 1, meaning best friend, to 5 for "dislike") indicate that girls are more favorable toward those boys most accepted by other boys. Girls' acceptance by boys is not related to girls' acceptance by other girls.—*E. L. Robinson.*

2901. Stott, Leland H. (Merrill-Palmer Inst., Detroit, Mich.) **Personality at age four.** *Child Developm.*, 1962, 33(2), 287-311.—"A combination of cluster analysis and factor analysis was used to identify and describe the common social behavior dispositions underlying the observed behavior of a group of four-year-old children. The behavior data were recorded in terms of 220 check-list items. The cluster analysis of the intercorrelations among these items resulted in 51 clusters or surface traits which, in terms of an hierarchical conception of personality organization, represented the first level of generalization. The correlations among the 51 clusters were then factor analyzed. The outcome was 14 factors,

13 of which were adequately portrayed by their constituent items for interpretation."—*W. J. Meyer.*

2902. Tabachnick, B. Robert. (U. Wisconsin) **Some correlates of prejudice towards Negroes in elementary age children.** *J. genet. Psychol.*, 1962, 100(2), 193-203.—This study examines satisfaction with self in each of 10 categories as possible correlates of prejudice towards Negroes in elementary age children. The Ss were 302 children attending the 5th grades of 6 elementary schools in the San Francisco Bay Area. Low, but statistically significant, correlation coefficients revealed satisfaction with personality characteristics and satisfaction with social relations with peers to be correlates of prejudice in children. Slighter, but statistically significant, correlation coefficients suggest that satisfaction with mental abilities, satisfaction with social relations with parents and teachers, and satisfaction with achievement in school subjects may be related to prejudice in elementary age children. Children who were more satisfied with themselves tended to be less prejudiced than children who were less satisfied with themselves. Satisfaction with work habits, satisfaction with physical ability and appearance, and average grade level achievement (with and without intelligence controlled) were found not to be related to prejudice in elementary age children. The results supported Allport's hypothesis (1954) that felt frustration is closely related and objective frustration negligibly related to prejudice.—*Author abstract.*

2903. Torgoff, Irving. (Merrill-Palmer Inst., Detroit, Mich.) **Personality and social development: Societal influences.** *Rev. educ. Res.*, 1961, 31(5), 475-486.—The effect on personality development of the radical social changes characteristic of contemporary life was a matter of much concern and conjecture but of surprisingly rare empirical effort. Wide attention was given both to the process by which social class and ethnic background affected achievement motivation and to the role of parents as mediating agents. The author thinks that much of the research reviewed by him would have benefited from the use of previously obtained base lines by which to assess change. The need for systematic, periodic, extensive assessments of social and personality characteristics cannot be ignored if we are ever to understand the impact of contemporary and future social changes on personality development. (81 ref.)—*F. Goldsmith.*
